Unfortunately he did not decide in his own mind what was the right and open course to adopt, and take it at all hazards. He thought only of what was safest—in a worldly point of view—to his own interests, and as usual when people decide from unworthy motives he took the very course least adapted to secure his ends. Had he at once telegraphed to Smirnoff that the child was in his hands, all would have been well; but fear of identifying himself

"He was astonished to see a tall soldierly figure coming towards them."

with his wife's unpleasant relative actually made him an accomplice.

The monastery of Kupsk is famous all through Russia for the possession of several miraculous relics and a holy picture that would work cures. Trains of pilgrims may be seen in the summer, just before the harvest work begins, toiling along the dusty roads to Kupsk. They hope by the self-imposed fatigue of the journey to propitiate St. Sergius of Kupsk, who, taking compassion on them for their confidence in him, will do his best to secure them a full pardon for their sins.

The theory is that they are too unworthy to approach the throne of grace directly, and therefore they have to get some one whose virtues have placed him (or her) in the light of sanctity, and given him a right to demand indulgence for the shortcomings of others. They have not been taught Who is the Way, the Truth, and the Light, and Whose ear is ever accessible to the prayer of the contrite.

The monastery is like a fortress; it is surrounded by a high wall, unmounted by the strange-looking battlements peculiar to Russian architecture, and already referred to as being met with in the Kremlin at Moscow.

Outside the building is the moat, or ditch, and at intervals along the walls cylindrical towers are placed, with pointed roofs, looking very much like the shot now used for very big guns in the English navy set on end. There are two gates, one to the east, which is still used, and the other to the west, which has long since been closed up.

The grand leaves of the eastern gate are only opened once a year, at Easter, when the Metropolitane, or Archbishop of Moscow, comes to inspect the state of the establishment. Access is gained by means of a side portal in one of the towers flanking the gate, while a large wicket cut in the big gate itself permits of the passage of carts and carriages. Within the space included by the walls are the little stone dwellings of the monks, which are built in a sort of irregular square, having the celebrated church in the centre.

There is a monotony in the style of church architecture in Russia that saves the writer an immense amount of time in description, for having described one we describe all. There are the five domes with the turnip-looking tops, surmounted by the crescent, from which rises the Greek cross, invariably richly gilt, and hung all round with gilt chains. Then there is the belfry, built separate from the church, so that the vibration of the gigantic bells shall not shake the walls of the building itself. At Kupsk the domes are not gilt, but are painted a rich grass-green, profusely studded with gilt stars. The walls are carefully white-washed outside, as are indeed the outer walls of this curious edifice—or rather collection of edifices. The staring white, the bright green, and the glittering gold unite in giving a glaring, brand-new look to these places which is at variance with our ideas of the solemnity and somewhat sombre nature of ecclesiastical remains. Milton's

"Storied windows richly light,
Casting a dim religious light,"

are seldom found in Russia. Nor are there any very ancient churches. Around the church lies the burial-ground of the

monks, to which the remains of certain wealthy benefactors to the monastery are admitted. To these proud monuments are raised, but no monumental effigies are found—nothing but the name, patronymic and surname of the departed, and (if his living friends like to pay for them) plenty of flowers.

The Russian monks are not to be confounded with *priests*, who are quite a different set of people. The monk may not marry, the priest *must*; and the priest is consecrated and set aside for performing the rites of religion, which the monk is not; he only acts as one of the congregation. The whole body is governed by an abbot, called an Igumen or Archimandrite. The dress of the monks is a black under-tunic and a black robe fastened at the side. They wear a curious high-crowned cap, something like the high Persian turban, and from this depends a sort of veil, or ornament, which always hangs behind. They do not shave, or cut the hair of the head or beard.

The central house on the northern side of the irregular square in which the church stands is distinguished from the rest of the houses by its superior size and general appearance. It is the residence of the Archimandrite, and to this house Steinfeldt conducted Ivan on the morning of his departure from the inhospitable home of Annie's aunt.

He approached the centre door, which stood invitingly open. He pulled the handle of a bell, which rung out loudly, sounding through the house like a notice to the inhabitants that it was time to "get up." A young monk, without the external robe, and dressed only in the under-tunic, appeared in answer to this summons. He was bareheaded, and when he saw Steinfeldt and the boy he made the profound and graceful bow for which all Russians seem to have a natural talent, improved by art to perfection.

"I want to see the Archimandrite," said Steinfeldt. "Is he visible just now?"

"He is at prayers, but if you will be so obliging as to walk into this room I will tell him that you wish to see him as soon as he is at liberty."

"Many thanks. There is my card."

The servitor led Steinfeldt and Ivan into a spacious room, with no carpet on the floor, which, however, was scrupulously clean. There was a large sofa in the middle of the wall opposite the window, and before this stood a common square table on four legs, like an English kitchen-table in size and appearance, only it was of dark mahogany, nearly black with years. Opposite the door was a large press of common deal wood, painted to resemble mahogany, which it singularly failed to do. Half a dozen old-fashioned chairs, with cane seats, a great number of wretched portraits of former Archimandrites, and the oblong, or sacred picture of the household, with its gorgeous frame of gold and adornments of plates of the precious metals, completed the arrangements of the room.

Steinfeldt and Ivan sat on chairs placed on each side of the sofa at each end of the table, Ivan having reverently crossed himself before the oblong. He was quite awestruck at being in such a place, and felt something between a detected pick-pocket and an angel—the first impression arising from a feeling of his own unworthiness, and the second from his delight at finding himself so near heaven and those who knew all about it!

They had not to wait long before they heard some shuffling steps approaching the door, which was flung open and gave admission to a venerable old man singularly pale in the face but with unusually brilliant eyes. He wore the monk's dress already described, only in the front of his high black cap there was a white cross displayed, and instead of a black veil depending from the summit this ornament was white. Round his neck he wore a thick chain of silver gilt, from which depended a cross of the same. He was supported by an inferior monk, though not a servitor, and the expression on this man's countenance was more of this world than that which beamed from the pale features of his superior.

We have already told the reader how the Russians call people by their Christian names, followed by Christian names of their fathers to which the suffix *vitch* is added. This is easy for them to do in cases of Russian names, but they find a difficulty with foreign names occasionally. Steinfeldt's name was Hans. He had really been so christened, although the word is generally regarded as only the abbreviation of Johannes, which is equivalent to John or Ivan in Russian. His father's name had been Johann, therefore Herr von Steinfeldt was called by the Russians "Ivan Ivanovitch," and by his wife Hänschen or Johnny.

The Archimandrite accordingly with a grand bow addressed our friend as Ivan Ivanovitch, and asked him in what way he could be of use to him.

"Your eminence will feel for me when I tell you that a connection of my wife's—"

"Marie Feodorovna?" inquired the abbot.

"Precisely so. A connection of Marie Feodorovna's has been foolish enough to mix himself up with certain political troubles in Moscow. I, on my wife's account, have done my best to shield him and to help him, but it seems in vain; he *will* get into hot water. One of his plots had nearly cost him his life, but by means of heavy *na tchai* I obtained a verdict for him on the ground of insanity. Well, he has now been attempting another piece of nonsense which will bring the police upon him, and he has asked me to take charge of this little orphan until he can clear himself. Should he succeed in doing this he will return to Germany and send money for the boy afterwards. In the mean time I cannot undertake the charge of a Russian. I am a Protestant and quite opposed to the Greek Church, I therefore thought it best to bring him to you with the request that you should educate him in your own faith and in your own manner, only let him be taken off my hands. Of course I am ready and willing to pay for his board and education, and am glad to leave him in your hands to take care of until we see what can be done with him."

"Take a seat, Ivan Ivanovitch, and let us talk this over a little."

The abbot indicated with his hand the sofa seat to Steinfeldt, who declined the honour, stating that the abbot of so renowned a monastery must always *preside* and take the sofa seat. This is a great point of etiquette amongst the Germans and Russians. At last the Archimandrite did as Steinfeldt wished. His aide-de-camp sat next him. Steinfeldt sat on one of the large chairs at the side of the sofa, and Ivan on the other.

"And," said the monk, "what is the name of this little waif?"

"He is called by my own name, Ivan Ivanovitch," answered Steinfeldt, adroitly. "His father is said to have been killed before Plevna, and his name I do not know, so that you may call him what else you please."

This was very subtle, because there was nothing to rouse Ivan's suspicion or to make him declare that he was known as Ivan Dobroff. He had heard the story of his father's death at Plevna, so that everything seemed just as he had heard it. Steinfeldt had thought it best not to caution him in any way yet, and to leave the whole matter to the chapter of accidents.

"No Russian can be indifferent to the fate of a true believer," said the abbot, "and I shall gladly take upon me the charge you propose, but we are not rich, and therefore can do little for him should your bounty fail or should you pass away!"

"I shall take the liberty of arranging for him half-yearly in advance, and in case of his sudden removal, which may take place at any moment, the sum paid is to be considered as a donation to the monastery."

"It is a very fair and handsome proposal, Brother Ambrosius," observed the abbot. "Can you say anything against it?"

"I would gladly have known more of the boy, but I suppose that coming from Ivan Ivanovitch Steinfeldt we ought to be satisfied. I cannot say that I am."

This speech was a lucky one for Steinfeldt, because Ivan greatly resented it. He was just about to blurt out something relating to Smirnoff, the Gymnasium, Mazielovo, etc., when this insulting manner of speaking of him stopped him. Besides which he had taken a great liking to Steinfeldt, and had formed as marked a dislike to the monk whom the abbot called Brother Ambrosius.

"Now the question arises as to the sum which you think you would require to reimburse you for your expenditure. As you don't seem to like to mention it yourselves, let us say something. Would five hundred roubles be too little?" (Five hundred roubles are just £50.)

The monk looked at the Archimandrite, who looked at the monk again in amazement. For their simple habits of life the offer appeared magnificent, and was evidently viewed by the monk with suspicion. But the abbot at last said, quietly,

"If we have to clothe him it may cost us nearly that, but we should render you a strict account."

"Certainly not," replied Steinfeldt. "You render me a very important service for which I am prepared to pay, and as yet I only offer what I think it would cost you to keep him. I should like him to be well taught whatever you can teach him, but what is beyond that would be considered as a separate matter to be paid for as a distinct charge. His clothes will be sent."

All this time Ivan had been thinking what to do. Should he rest satisfied with the statements made by Steinfeldt? They were strictly true, though not the whole truth. He was but a boy, and though a shrewd boy, he could not be expected to have the experience, tact, and knowledge that would have put him on an equal footing with a man of the world, a tho-

rough man of business, and master of the situation. He would have liked to say something about Smirnoff, but remembered that he could reserve that for a trump card at any time. So he thought he would wait. He had no idea that such large rewards had already been offered for him. How could he know of them? And he thought the whole matter would resolve itself into Hermann's receiving a reward for finding him.

"He is backward in arithmetic, I fear," remarked Steinfeldt, "and several things which he ought to know. Now I don't want his education to be neglected, and you cannot get teachers to attend gratis, so whatever you find you require more than these five hundred roubles let me know, and I shall be only too happy to pay. It is quite absurd to think of including any articles of dress for such a sum. I shall send my own tailor, or you can engage one here and I will pay the bills."

It was finally arranged that a tailor should come and measure little Ivan for clothes according to his taste, and that the bills were to be sent in to Steinfeldt; that books and such necessities should also be charged extra, but that ordinary tuition was to be included. He was to be taught the *true* faith (i.e., the traditions of the Greek Church), the Russian language and Slavonic, arithmetic, geography, music, and drawing. French and German were to be extra, but Latin was to be included.

All these things being arranged, Steinfeldt rose to depart, but the abbot suggested that he might want some chat with Ivan, and withdrew with Brother Ambrosius, leaving Steinfeldt and the boy alone.

"You are very good to me," said Ivan. "I wonder why?"

"Annie begged my wife to do all she could for you, to keep you quiet for a time, and not to let any one get hold of you. I would do anything for Annie."

"So would I," said Ivan. "But why is no one to get me? Her father wants to squeeze money out of Metrotan Dmievitch for delivering me back to him."

"He does not know where I have put you, and the best way to keep persons from finding out that money is to be had from Mr. Smirnoff is never to mention either his name or your own until the time comes. I don't want to make money of you. But you had better say no more to the monks about yourself than I have told them."

"All right!" said Ivan.

Steinfeldt laughed pleasantly, and seeking the abbot, paid half a year's board and lodging for Ivan in advance, and took leave of the monastery.

Ivan, left to himself, found it rather dull amongst the Brothers, but he was not a badly disposed lad. Like all boys who are worth their salt, he had a deep and very sincere reverence for religion. He was an early riser, and liked nothing better than getting up in the small hours of the morning to assist the brethren in getting ready the church for early matins. In a very short time he became a great favourite among the members of that singular community. Thus weeks passed on, and Ivan became more and more interested with all he saw.

There is no rule without an exception; and even amongst these inhabitants of a sort of living tomb, there were spirits who, in the great world, would have been

revolutionists or innovators—Nihilists, or something of the kind. One of these, a certain Brother Angelo, greatly interested Ivan. He had held an important public position, and was a rich man of noble family. Domestic troubles had broken up the home, his wife was dead, his eldest son had been shot in a duel, his second was in exile, working in the mines of Siberia. In grief and bitterness of heart he had retired to this monastery, endowing it with his whole fortune, hoping thus to escape from himself. But this is always impossible, and the maddening thought that he had brought all this misery upon himself sometimes tormented him beyond endurance.

Like everybody who came in contact with Ivan, he was charmed with the boy's frankness and willingness to please, so he took an active interest in the boy's studies, helping him materially in mastering the difficulties of that bugbear of boyhood, the Latin grammar.

One evening, after Ivan had just completed the first month of his sojourn at Kupsk, he was sitting indoors with Brother Angelo, who had invited him to his cell for the purpose of studying more at ease. It was beginning to be cold, the huge stoves in the monastery were heated three times a week, and the double windows all through Russia were being fastened in, secured with putty and wool from all attacks of cold from without or escape of the warmth from within. Brother Angelo was warmly wrapped up in a long black mantle lined with fur, and Ivan sported the long-coveted red silk *rubaschka*, or outside shirt, black velvet trousers, and high-made boots of the national costume.

"You have been well taught so far, Ivan," said the Brother.

"Oh, yes; our arithmetical master was a good one, and the German master under whom I was placed was a good teacher, much better than the professor in the fifth class, who was said to be a muff. He looked it."

Curiously enough this was the first intimation that the monk had received of Ivan's having been a pupil in a Gymnasium. The monks did not talk much as a rule in the monastery about their antecedents and the life they had lived before joining, and no one had cross-examined Ivan yet on these points.

"Was your Gymnasium in Kursk?" asked Brother Angelo.

"No; in Moscow."

"Oh, indeed! Do you know Moscow well?"

"I should think so!"

"And you worked well at the Gymnasium, I see."

"I got good marks, though old Schwann did get savage with me at times."

"Ah! then you were in the First Gymnasium?"

Ivan felt that he was being pumped, and so he answered briefly, "Yes."

Brother Angelo asked him no more questions, but he made a mental note of what he had heard. It was a Saturday evening, and the grand service was soon to be performed, for in Russia the Sabbath begins at sunset on Saturday, and lasts through till sunset on Sunday, when all kinds of amusements are indulged in. The result of this is that people do not wait for the evening of Sunday, but turn the whole day into one of pleasure and business. The churches are generally well attended on Saturday evening, but

there are many men in Russia who only go once a year, at Easter time.

The serving monks pulled the strings in the belfry which set the merry bells in motion, and one of these men was so clever at his work that he could ring seven bells at once. The cords of two were attached to levers, which he moved with his feet. One stout rope was stretched behind him, and he played it by bumping backwards upon it when the big bass boom was wanted; the remaining cords he held in his hands. It was a sight for a painter to see this weird figure in his tightly-fitting long black under garment and long flowing hair tossing about in the bellringers' loft of the belfry, where he could be plainly seen in the light of the setting sun, dancing within the arches of the loft, which were unprotected by glass and were open to the free fresh air of heaven.

As a great treat Ivan had been allowed to assist the bellringer on many occasions, and he told Brother Angelo that it was the only accomplishment he had that was worth a rap, as they stepped from the cell to cross the cemetery to reach the church. As we have said, Brother Angelo was warmly wrapped up in his black mantle lined with fur. Ivan had thrown a black velvet frock without sleeves, a sort of skirted waistcoat, over his rubaschka, and he walked quietly beside his friend, looking at the strange figure of the monk in the belfry, whose black dress formed a strong contrast to the bright colours of

the sky, which glowed like molten gold. Inside, the church was lighted up with a profusion of wax candles, varying in size from the tremendous candles near the high altar, four feet high and three inches in diameter, to the feeble taper not much thicker than an ordinary pen-holder.

The icon or screen was richly gilt, and contained some curious efforts of the painter's art, so covered with gold and silver as to be almost invisible as paintings. Then there was the picture of "Our Lady of Kupsk," to see which and to appeal to which for aid in various stages of distress all sorts and conditions of Russians came flocking from the country round.

In a large silver vessel, made in the form of a coffin, a few blackened bones were enshrined. These were said to have once formed part of the mortal frame of St. Sergius of Kupsk. The shrine was about two feet in length, and was of solid massive silver, with richly-gilt feet, handles, and ornaments. On the day of the saint, *i.e.*, the day set aside for his service in the calendar, the lid of the coffin was removed so as to expose the remains, which were the bones of one leg, of a hand, and an arm. These remnants of the departed are viewed with awe and veneration by the simple.

On the present occasion the shrine was closed, but high mass was being celebrated. There was the priest in cloth-of-gold pall, with a purple and gold mitre on his head; there was the deacon in silver-

thread garment over his brown vestments. There was the choir singing the magnificent chants of the Greek Church, in which they were joined by the whole body of monks present at the ceremony. At a certain portion of the service the priest turns his back on the people, and ascends the steps leading to the holy screen, and, when there, the gates of the screen, called the Imperial doors, are flung open, and the sacred interior is revealed. The music is entirely vocal.

The service over, Ivan was leaving the church with his friend and traversing the courtyard on his way to the house of the Archimandrite, when he was astonished beyond measure at seeing in this very court, hitherto so still and unrelieved by any change, a tall figure in a long grey overcoat, surmounted by a glittering helmet, and wearing the peculiar sabre of the gendarmes, the mounts of which shone in the twilight with a strange unwonted lustre.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XVIII.—THE TALKING OSTRICH.

AFTER this dreadful catastrophe Cyprien and Li thought only of hurrying from the spot as quickly as possible.

They skirted the north edge of the wood, and after an hour's walk reached the bed of a torrent, which was then dry. The torrent bed formed a path through the lentisks and figs. Into it they turned.

There a fresh surprise awaited them. The torrent led into a good-sized lake, surrounded with luxuriant vegetation. Cyprien tried to follow the banks, but these were in places too steep.

To return by the road he had come would have been to give up all hope of catching Matak; and as on the other side of the lake there were ranges of hills leading up to mountains of considerable height, the travellers set off round the sheet of water in the hope that they would there obtain a good view over the surrounding district. The absence of any road made the operation a somewhat difficult one, owing to their having to occasionally dismount and lead the giraffes by the bridle. It took them more than three hours to advance five miles as the crow flies.

When they reached the point on the other side of the lake opposite to that they had started from, night came on; and, thoroughly tired out, they decided to camp. But with their scanty resources they could not be very comfortable.

Li busied himself with his usual zeal, and did what he could, but the result was not encouraging.

"You are very tired, Pa!" said he, sympathisingly. "Our provisions have nearly all gone! Let me go off in search of something to some village close by. I am sure to bring somebody to help you."

"Leave me, Li?" asked Cyprien.

"It is necessary that I should," said the Chinaman. "I will take one of the giraffes and strike off to the north. Tonaia's town that Lopepe spoke of cannot be far off, and I will manage it so that they will welcome you. Then we can go back to Griqualand, where you need no longer trouble yourself about the three scoundrels that have died."

Cyprien thought over the Chinaman's proposition. He saw that if the Kafir was to be caught it would be in this neighbourhood, consequently it would not do to leave it. On the other hand, more provisions must be obtained. And so he with great regret decided to separate from Li and wait where he was for forty-eight hours. In that time the Chinaman on his giraffe would be able to secure assistance and return.

Li did not delay an instant. Thinking nothing of his own rest, and abandoning all idea of sleep, he wished Cyprien good-bye, kissed his hand, jumped on his giraffe, and disappeared in the night.

For the first time since his departure from Vandergaart Kopje Cyprien found himself alone in the desert. He felt profoundly miserable, and as he lay rolled in his blanket gave himself over to the gloomiest thoughts. Isolated, almost without food and ammunition, what was to become of him in this unknown country, hundreds of miles away from civilisation? The chance of catching Matak was now a very feeble one. He might be only half a mile from him, and yet be ignorant of his whereabouts. The whole expedition had been disastrous. Every hundred miles had cost the death of one of its members. One only remained—himself! Was he destined to die miserably like the others?

Such were Cyprien's reflections as he gradually fell asleep.

The freshness of the morning and the night's rest gave a more confident tone to his thoughts when he awoke. While waiting for the Chinaman's return he resolved to ascend the mountain at the foot of which he had camped. He could from the summit command an extensive view, and might with the help of his glasses discover some trace of Matak. But to do so he had to leave his giraffe, for no naturalist has as yet grouped that animal with the climbers.

He began by taking off the halter so ingeniously contrived by Li. One end of

it he tied to the animal's leg, the other to a tree surrounded by long luscious grass; and he left sufficient length for the giraffe to feed at its ease. And if we add to the length of the rope the length of the giraffe's neck we must admit that very little rope was required to give it an ample radius of action.

Having secured his mount, Cyprien threw his gun on to one shoulder and his blanket on to the other, and, giving the giraffe a friendly pat in token of farewell, began the ascent of the mountain.

The ascent was long and difficult. The whole of the day was passed in scaling its steep slopes, turning its rocks and unclimbable peaks, and recommencing on the east or south an attempt made unsuccessfully on the north or west. When the night came Cyprien had only got half way up, and he had to wait till morning to continue the ascent.

Starting at daybreak, after assuring himself by means of his glasses that Li had not returned to the camp, he reached the top of the mountain about eleven o'clock. There a cruel deception awaited him. The summit was wrapped in cloud, and a thick mist hung over its lower flanks. In vain Cyprien tried to pierce the curtain and see down into the neighbouring valleys. The whole district had disappeared, covered with a mantle of shapeless vapour which hid everything beneath it.

Cyprien was obstinate, and waited, hoping the fog would clear off. He hoped in vain. As the day wore on the clouds grew in density, and when night came the mist turned to rain. He was on a bare plateau with not a single tree or rock to shelter him, and night coming on, with an increasing downpour of fine steady rain that gradually soaked through his blanket and his clothes and wetted him to the skin.

Matters were growing serious. To descend under such circumstances would have been foolish. Cyprien made up his mind to shiver in the rain all night and dry himself in the morning in the sun.

The rain was most refreshing after the drought that had preceded it, and Cyprien soon persuaded himself that there was nothing very disagreeable about it after all. One of its most unpleasant consequences was that he would have to eat his dinner uncooked. To light a fire or even a match in such weather was out of the question, and so he had to content himself with opening a tin of meat and eating it as he found it.

In an hour or two, in a half-torpid state from the continual rain, he fell asleep on a large stone for a pillow and his dripping blanket for a bed. When he awoke he was in a high state of fever.

Knowing that he was lost if he remained any longer beneath the deluge—for the rain was still falling in torrents—Cyprien made an effort, rose to his feet, and, using his gun as a stick, began the descent of the mountain.

How did he reach the bottom? It would have puzzled him to say. Sometimes slipping down the greasy slope, sometimes sliding over the shining rocks, bruised and breathless, and wrung by the fever, he kept on his downward way, and about noon reached the camp where he had left the giraffe.

The animal had gone, impatient probably at having been left alone, and perhaps pinched with hunger, for the grass within the circle of which the halter

formed the radius had all been cropped. The giraffe had bitten through the rope and gained its liberty.

Cyprien would have keenly felt this new piece of ill-fortune had he been in his normal state, but extreme lassitude and weariness had almost crushed the life out of him. He could only throw himself on his waterproof bag, which he fortunately found untouched, change his wet clothes for dry ones, and then drop back to sleep under the shelter of the baobab beneath which he had camped.

Then began a strange period of half-slumber, of fever, of delirium, in which everything was mixed up, wherein time, space, and distance retained not a ghost of reality. Was it night or day? sunshine or rain? Had he been there twelve hours or sixty? Was he alive or dead? He did not know. Pleasant dreams and frightful nightmares followed after each other without intermission. Paris, the School of Mines, his home, Vandergaart Kopje, Miss Watkins, Pantalacci, Hilton, Friedel, legions of elephants, Matakis, and flights of birds spread over a boundless sky, all his remembrances, sensations, sympathies, and antipathies jostled each other in his wandering brain as if in a straggling battle of incoherences. To the creations of the fever were added the impressions of what was going on

molrowing, hyenas laughing, he painfully pursued the romance of his delirium, and thought that he heard the crack of a rifle, followed by a deep silence. Then the concert began again, and lasted till morning.

During this delirium Cyprien would probably have passed from the fever into everlasting rest if the strangest, most extravagant event had not happened to bring him back to reason.

The morning came. It rained no longer; the sun was high on the horizon. Cyprien had just opened his eyes. He looked, not without curiosity, at an ostrich of large stature that, after approaching him, stopped still a yard or two off.

"Is that Matakis's ostrich?" asked he to himself, still pursuing his main line of thought.

It was the bird itself that spoke, and that in excellent English.

"There's no mistake! Cyprien! My poor fellow, whatever are you doing here?"

An ostrich that spoke English, an ostrich that knew his name, was certainly enough to astonish any man even in his sober senses. But Cyprien was not in the least astonished, and took the remarkable phenomenon as a matter of course. He had seen so many strange

"Sometimes slipping down the shining rocks."

around him. And what made things all the more horrible was that in the thick of a storm of jackals barking, tiger-cats

phenomena during the night, it seemed quite a natural consequence of his mental derangement.

"You are not very polite, Mrs. Ostrich," he answered. "What business is it of yours?"

He spoke in that dry, jerky way peculiar to those suffering from fever, and which left no doubt as to the state he

by. I did not even know you were in these parts."

Cyprien was hardly in a state to talk to his friend, and could only make a few signs. Barthes saw that what was wanted was to get the sick man the help he

with just a suspicion of cordial completed the meal, which greatly strengthened Cyprien, and began to clear his brain of the fumes which clouded it.

About an hour afterwards, Barthes having treated himself to some dinner, sat down by the engineer and told him how he came to be there so strangely disguised.

"You know what I am capable of in search of any novelty in sport. During the last six months I had killed so many elephants, zebras, giraffes, lions, and all sorts of big game and little game, fur and feather—without counting a cannibal eagle that is the pride of my collection—that a few days ago I was seized with the idea of making a change in my sporting proceedings. Up to then I had only travelled escorted by my Basutos—thirty resolute fellows, whom I pay at the rate of a bag of glass beads a month, and who would throw themselves into the fire to please their lord and master. But I was very hospitably received by Tonaia, the great chief of this country, and with a view of obtaining the right of shooting over his territory—a right of which he is as jealous as a Highland laird—I consented to lend my Basutos with four guns for an expedition that he was thinking of against one of his neighbours. The reinforcement rendered him simply invincible, and he gained a signal triumph over his enemy. Hence a close friendship sealed in blood—that is to say, we mutually sucked a pin-prick in our forearms, and for the future Tonaia and I are brothers for life—and death! Assured of being let alone wherever I might wander throughout his possessions, I started off the day before yesterday in chase of tiger-cats and ostriches. As far as tiger-cats are concerned, I had the pleasure of shooting one last night, and I am rather surprised that you did not hear the row which preceded the shot. The fellow had been attracted by the odour of raw flesh, and two or three hundred jackals and hyenas had been favoured with the same idea. You can imagine the concert that took place!"

"I think I heard it," said Cyprien. "I even fancied it was given in my honour."

"Not at all," said Barthes. "It was in honour of a buffalo's carcass at the bottom of the valley opening to your right. When day dawned nothing was left of it but the bones. I will show you; it is a very creditable piece of anatomising. You shall also see my prey, the biggest I have brought down since I landed in Africa."

"But why the strange disguise you wore this morning?" asked Cyprien.

"It is an ostrich dress. As I told you, the Kaffirs often use it to approach the birds, for they are very shy and difficult to get within range. You will say that I have my capital rifle. So I have, but what of that? The fancy struck me to go out in the Kaffir style, and to that I owe my finding you, don't I?"

"And just in time. Without you I shouldn't have troubled the world much longer," answered Cyprien, as he cordially clasped his friend's hand.

He was now out of his ditch and comfortably lying on a bed of leaves that his companion had arranged at the foot of the baobab. The gallant fellow's kindness did not stop at that. He went down into the neighbouring valley in search of his tent, which he always took with him on such expeditions, and a

"Is that Matak's ostrich?"

was in. The ostrich seemed greatly troubled.

"Cyprien, my friend, you are ill, and all alone in the desert!" exclaimed the bird as it knelt by his side.

This was a physiological phenomenon no less abnormal among struthious birds than that of the gift of speech, for kneeling is a movement generally denied to them by nature. But Cyprien in his fever persisted in showing no astonishment. It seemed just as natural when the ostrich felt under its left wing and took out a leather flask and gave him a mouthful of the contents.

The only thing that began to surprise him was when the strange animal rose and threw off what seemed to be his plumage, and took off his neck and head, and then changed into a tall, sturdy, active man, and no other than that mighty hunter, Pharamond Barthes!

"Yes, it's nobody else!" exclaimed Barthes. "Did you not recognise my voice? You are astonished at my outfit? It is a dodge I learnt from the Kaffirs to get nearer the real ostriches and reach them with their assegais! But let us talk about yourself, my poor fellow. How came you here, sick and abandoned? It was the merest chance I saw you as I went

needed, and to attack the fever as soon as possible.

His experience in the desert had been a long one, and the bold hunter had learnt from the Kaffirs a method of treatment of great efficacy in marsh fever such as his companion was suffering from. He dug in the ground a sort of ditch, which he filled with wood, having arranged it so that there was a good draught through it. When the wood had been lighted and consumed it converted the ditch into a veritable oven. Barthes laid Cyprien in the ditch, after carefully wrapping him up so as to leave only his head exposed to the air. Ten minutes had hardly elapsed before an abundant perspiration showed itself—a perspiration which the amateur doctor took care to foster with the help of five or six cups of an infusion he made with some herbs he had gathered; and then Cyprien dropped off into a refreshing sleep.

At sundown, when he awoke, he was sufficiently recovered to ask for something to eat. His ingenious friend was quite prepared for him, and immediately offered him some excellent soup which he had made out of the spoils of his rifle and different sorts of vegetables. A wing of roast bustard and a cup of cold water

quarter of an hour afterwards he had pitched it above the invalid.

"And now, Cyprien," said he, "let us have your history, if you are not too tired to tell it."

Cyprien felt himself well enough to satisfy Barthes's very natural curiosity. Very shortly he told him of what had occurred in Griqualand, why he had come in pursuit of Matakai, and his diamond, and what had been the chief incidents of the expedition. He told him of the deaths of Friedel, Hilton, and Pantalacci; the disappearance of Bardik; and how he was waiting for Li to return to the camp.

Barthes listened with profound attention. When asked if he had come across

a young Kaffir whose appearance tallied with that given by Cyprien he replied in the negative.

"But," added he, "I found a horse that had been turned adrift, and which may be yours."

And he explained how the horse had fallen into his hands.

"Two days ago," he said, "I was out hunting with three young Basutos in the mountains to the south when I suddenly saw a grey horse dash out of one of the ravines. He had no harness, only a halter and a rope trailing behind him. He seemed very undecided which way to go, and I called out to him and showed him a handful of sugar, and he came with me. I took him prisoner. He is an

excellent brute, full of courage and fire, and 'salted like a ham.'"

"He is mine! That is Templar!" exclaimed Cyprien.

"Well, Templar is yours, then," answered Barthes, "and I am glad to return him to you. Now good-night; go to sleep, and at daybreak to-morrow we clear off from here."

Then, adding practice to precept, Barthes rolled himself in his blanket and went to sleep by the side of Cyprien.

In the morning the Chinaman returned with provisions, and before Cyprien woke, Barthes explained matters to Li, and left him in charge while he went off to fetch the horse.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXX.

FOUR months have elapsed since the day when Lang received official intimation that he had passed the matriculation in the first division. When the news arrived he was still in bed; his recovery bid fair to be a long and weary one.

He is now, however, back in town. The physician whom he has consulted has decided that he may begin work again, so for the last month he has been a fairly regular attendant at the Rev Peter King's, reading law with Mr. Edward King, barrister-at-law, who spends some of his spare time in coaching backward students.

Not that Lang is supposed to be backward; his passing his examination so well puts that idea out of the question. But it is not thought wise to article him just yet.

"If I were in your place, sir," said the physician to Mr. Lang, "I should not insist on his settling down to steady work for a month or two. There is every reason to believe that he has perfectly recovered, yet there is a strange depression about him which I cannot understand. Has he any secret trouble or anxiety?"

"Not that I am aware of," replied Mr. Lang.

"He is not in debt, I suppose?"

"I cannot imagine that he is; I may say that I am sure he is not."

The physician looked thoughtful.

"Then I should let him lead a fairly easy life for the next month or two, or even three. Then, if he seems to regain his spirits, well and good, let him have steady work. If he still remains depressed you must come to me again."

So it happened that Lang was in clover, according to most fellows' idea of clover: doing just as much work as he liked and no more.

But he did not lose the feeling of depression. How could it be expected, remembering that the effects of his deception were only beginning to make themselves felt?

He had been able to send a five-pound note to Fanshawe soon after he returned to town. He was ashamed of himself for hiding his whereabouts from him so long, for after all Fanshawe had fulfilled his

part of the contract and was entitled to his pay.

It was a source of continual wonder to him that he had not heard from him. Fanshawe was always more or less in want of money, generally more; and he was not the sort of fellow to forget to remind another of a promise to pay.

Fanshawe's acknowledgment of the note showed the reason:

"Dear Lang, — Thanks for the cash, which was very handy. I should have bothered you about it before, but I had a windfall at the beginning of the year, which has kept me going ever since. I'll stand you an evening's fun out of your fiver if you'll come up to my place."

It was the postscript which gave Lang a shock.

"P.S.—Can I be of any use to you for your 'Intermediate'?"

Could he never get rid of the tempter?

No, never. He had commenced his career by a fraud. Even supposing he were article'd, became a successful practitioner and made his fortune, he would have to endure the constant fear that some one would whisper to him some day, "You are no lawyer; your articles were obtained by fraud; go and stand in the prisoner's dock, that is your proper place!"

Is it any wonder that he did not regain his spirits?

He had heard nothing from Melhuish. He had never expected news of him, and had now in his own troubles forgotten those of others.

Garland was living at Mr. King's, expecting to go to college after the long vacation. Soady had passed his examination with very creditable success and was now a clerk in the Patent Office. He was still a lodger at No. 15A, and had gained a signal victory over Caractacus. He saw a great deal of Garland, and as much as he could of Lang, but the latter rather avoided him.

"Can't make out what's the matter with Lang," he said to Garland one day. "He isn't half the fellow he was. Do you know anything about it?"

"No," replied Garland; "perhaps it's his illness."

"He was just as bad at Christmas, so 'tisn't that. I wish we could stir him up a bit. Perhaps this bazaar of Mrs. Hawtrey's may wake him up."

"I hope it may."

Soady was on quite the wrong scent about Lang. The note the latter had sent him asking him to receive letters addressed "A. B. C." had roused the strangest ideas in Soady's imaginative mind, but none of these bore any resemblance to the actual fact.

Yet the actual fact was nearer discovery than any one imagined.

CHAPTER XXXI.

IT was the day before the bazaar in aid of St. Peter's Home for Cripples. Mrs. Hawtrey had kept her word, and had made the young men whose services she had enlisted work nobly.

"It's as hot as Vesuvius," sighed Soady, as he wiped his forehead. He had been engaged for the last hour in fixing up a platform in the schoolroom of St. Peter's, Garland giving him valuable aid.

"Who'd think 'twas only May?" asked Garland.

"I don't know," was Soady's guarded reply. "I don't care what month it is, it's a baking one in here. Do you think that platform looks firm?"

"Try it."

Soady stepped on to the planks from the side. There was a sudden elevation of the other end of it, and Soady subsided backwards.

"Oh, I do hope you haven't hurt yourself!" exclaimed Meggie, who was standing near.

"Not much, thank you," was his reply.

"Didn't your head strike that pole?"

"I don't remember its doing so," said Soady. "The worst of the affair is, we shall have to fasten down these planks, or else we shall have every one shooting into the air to-morrow."

"That would spoil your tableaux rather badly, wouldn't it?"

"Yes, the Sleeping Beauty would have a rude awakening," said Soady, for he had been getting up some tableaux, the

admission to which was to be twopence only, and Miss Hawtreys was to be the Sleeping Beauty. (Belle had heard of it, and had volunteered the observation that she didn't think she would do it very well; which had caused a scene between the brother and sister, the former attributing the remark to envy, which was indignantly denied. But this is a parenthesis.)

At this moment Mrs. Hawtreys came up. She had just given the final touches to her stall.

"Isn't it time we all went home?" she asked. "It's nearly ten, and I'm sure you have all worked enough for to-day."

"I must just fasten down these planks to the trestles," said Soady. "I shan't be half a minute."

"Look, mamma," cried Miss Meggie, "the men are bringing in the piano."

Garland went off to superintend placing it, whilst Soady whacked the nails with a big hammer, and raised such a

There were only a dozen people present—ladies and gentlemen who had been working hard all the evening in the cause of charity, and one or two workmen. The big room was lighted by a couple of chandeliers only, which left

one thanked her, but there was a dead silence as she closed the piano. Then there was a sob heard in the farther recesses of the hall, and hasty steps of some one going out.

That broke the spell.

"Soady subsided backwards."

tumult that no one could hear what any one else said.

"Oh, do be quiet for a moment!" shouted Garland. "Get up early and finish it."

"There," said the unconscious Soady, proudly, "that's done. Why, here's the piano. How do you like it, Miss Hawtreys?"

"I haven't tried it yet."

Soady opened it, and gave the keys a dust with his handkerchief.

"Do just see if you like the touch," he said.

"You may have three minutes," said Mrs. Hawtreys, graciously.

most of it in gloom, through which the white stalls loomed strangely.

Meggie sat down to the grand piano, and began playing a reverie of Heller's. She was a skilful and feeling pianist, and she had now an instrument worthy of her powers, and an audience in the right mood for appreciating their display. Piece after piece she played, from a tender andante of Beethoven's to a spirited tarantelle of Raff's, passing from one composer to the other skilfully. The three minutes were lengthened to fifteen, and then twenty, before she ceased.

She had the best reward she could have had, and she appreciated it. No

"Who was that?" asked Mr. King.

No one knew; the hallkeeper was sure that no one was there when Miss Meggie began to play.

Who would have guessed that it was Lang? Yet so it was; he had come round to walk back with Soady for the sake of companionship, had heard the wonderful music, and it had touched his very soul. He felt so shut out from all that the music expressed, so lonely and miserable. He burst into a sob, and, ashamed of his emotion, hastened home alone. Would that he had looked away from self to Christ, to save and help him in his hour of repentance and need.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE LONDON.

THE London foundered in the Bay of Biscay on the 11th of January, 1866. On the 16th of that month there landed at Falmouth from the Italian barque Marianopolis only eighteen survivors out of the two hundred and thirty-nine passengers and crew that had left Plymouth eleven days before.

The London, like the Royal Charter, was one of the old class of auxiliary screws, fully rigged and sparred as a clipper, though of the longer build of the steamers of to-day. She had been launched in 1864, and became quite a famous ship, having distinguished herself by a run to Melbourne in fifty-nine days. She was of 800-horse-power and 1,752 tons register, and was owned by Money Wigram and Co.

She left the docks on the 28th of December, 1865, and Gravesend on the 30th. The year ended in a storm, and the London started in the thick of it. She had to lay-to off the Nore. With difficulty she made her way down Channel, and so threatening grew the weather that Captain Martin ran for shelter into St. Helen's Roads. The gale lulled a little, and the London left Spithead and steamed out to sea again past the Needles.

To take her into Plymouth Sound a pilot was signalled for. The pilot's boat capsized. The ship's boat was launched to the rescue; but though his two companions were picked up the pilot was drowned.

After this ominous commencement the ship anchored inside Plymouth breakwater and completed her passenger list. At midnight on the 5th of January she left for Melbourne. The storm had blown itself out. The sea was calm and there was a light wind ahead. On board of her, amongst others of lesser note, were the Rev. Dr. Woolley, the head of Sydney University; the Rev. Daniel Draper, a Wesleyan minister, who had been sent home on a mission as representing the Methodist Conference of Australia at the Methodist Conference of Great Britain; his wife, the daughter of one of the first missionaries to Tahiti, who went out in the Duff, as related in our article on the Martyr of Erromanga; Mr. G. H. Palmer, the editor of the "Law Review;" and last, though, as it proved, by no means least, a Mr. George "Vaughan," who had taken his passage in that name in order to ensure a certain amount of quiet and privacy during the voyage.

Regardless of the sailors' superstition, it was Friday when Captain Martin put to sea. Friday was fine; Saturday was fine; but on the Sunday the wind began to freshen, and on the Monday it had increased to quite a gale.

The London rolled tremendously. She had fifty tons of coal on deck, and twelve hundred tons of railway iron below, and this did not improve her behaviour. She would go over, down, down, as if going for good, and then whip up with such a sudden recovery as to throw the passengers nearly off their legs. As the wind increased the seas came dashing over her, and as the hatches were not quite tight the water found its way into the saloons until it was washing about nearly a foot deep.

The gale grew in violence, and at eight o'clock on Tuesday the foretopmast and jibboom were carried away, and during the afternoon the port lifeboat was swept off by the sea. The night was rough, the weather threatened worse to follow, and the ship was headed back to run for shelter to Plymouth. Soon afterwards the starboard lifeboat was lost, and then the starboard cutter broke away.

The jibboom had been saved and was lashed along the engine skylight. It shook loose, and about half-past ten at night a tremendous sea swept over the deck, dashed it on to the glass, and poured down the hole

it had made. The wind roared through the wire rigging, the lights shining up the masts showed the foretopsail, the only sail set, blown to ribands, with the tatters streaming

Bibles in search of some well-known text they hoped might comfort them in their final agony.

The ship, however, kept afloat. Angel

Captain Martin, of the London.

out straight from the yard, and only one corner standing; and the phosphorescent waves foamed round the ship in hills ten or fifteen feet above her deck.

The seas dashing down into the engine-room drowned out the fires. In vain sail after sail was hurried along to place over the hatchway; the wind was so fierce, and the waves were so wild, that the canvas was torn away as fast as it could be placed in position.

The hold slowly filled with water in spite of all that the pumps could do. The donkey-engine was kept going full speed under charge of Mr. Angel, the third officer; and all hands, passengers included, were called to take their turn at the manuals. The seas broke over so that at times the men were up to their armpits in water, and still they stuck to their work. Each time the pumping slackened, "Keep them going," shouted the third mate; and again the speed would quicken, though the effort was in vain. Cheering on the passengers as the mate did the men, stood Mr. Vaughan, now recognised as G. V. Brooke, the tragedian, who, bareheaded and barefooted, in only his shirt and trousers, kept at the pumps for hours, and worked to the last like the giant that he was.

At four o'clock on the Thursday morning the sea drove in four of the stern ports and the water poured down in torrents into the saloon. The passengers, women and children, were gathered there trying to follow Mr. Draper as he read snatches of the service and led them in prayer. But the rolling of the ship, the washing about of the water, the howling of the storm, and the rattling of the pumps, rendered the attention of his audience almost impossible. Yet, happily, even when words fail, Christ can listen at the heart.

When the ports drove in, the captain entered the cabin and confessed that there was no longer any hope of safety. The scene that followed was heartrending. Families clustered together, some in hopeless despair, some cool and resigned to the last, some on their knees praying for deliverance, some nervously twitching over the leaves of their

and Brooke did not let the pumps rest for an instant; the water streamed overboard fast, but not fast enough.

At ten o'clock an attempt was made to launch the starboard pinnace, but the sea smashed her as she floated and five men were thrown into the water struggling for their lives. At the news that a boat was being got ready one of the passengers appeared on deck with his carpet bag! "Fancy a man thinking of his goods at a moment like this!" said the captain, turning away in disgust.

At one o'clock the ship was down to her main chains, and was slowly settling. Still the pumps were going, and still the sea kept heaving in. Two small boats were all that were left. One of these, the port pinnace, was rated to Mr. Greenhill, the chief engineer, and the captain ordered the crew to launch her.

"There is not much chance for the boat," said he, "but there is none for the ship. Your duty is done, mine is to remain here. Get her out and take command of the few it will hold."

The other boat, a very small one, was provisioned by the boatswain, but she was never launched. The ship went down too quickly to allow of her being got off.

With difficulty the pinnace was lowered, and then came the question who were to go in her. "Fetch a lady," said one, and a man ran in search of a friend of his, but not finding her brought a strange girl to the side to give her a chance of her life. But as she saw the little boat tossing in the raging sea she drew back in terror and refused to move.

Another of the men dashed down into the saloon in search of his friend John Hickman, who was sitting with his wife and children. When asked to leave them, "No," he said, "I promised to stay with them to the last, and I will do so!" On the side where they sat the bunks were covered with water. "Lend us a hand, Jack, to move them over," and the two helped the wife and the children across the saloon, and then, with

a "Good-bye, old fellow," they were left to die.

"Well, we are going to go," said another who was left in the ship. "There is only one thing I regret. I had a draft of £500 on Ballarat, and only had £20 of it. I should like father to get the balance." And the wish was afterwards complied with.

The captain was asked to come.

"No," he said, "I will go down with the passengers. But I wish you God speed and safe to land."

The wind was so fierce round the boat that the men in her could not hear their own

voices. There were fifty people clustered on the poop, but none dare venture into the boat.

She pushed off. As soon as she left the ship a woman rushed to the rail, and shrieked, "I will give you a thousand pounds if you will take me!"

The boat had not got eighty yards away before the end came. The London sank stern foremost. As she went down the keel was out of the water as far as the foot of the foremast.

The captain was on the poop; Brooke in his red shirt was leaning on one of the half-doors of the companion; Angel was still run-

ning the donkey-engine, and had his hand on the lever as the waves closed over him.

In the boat were three passengers, the three engineers, a midshipman, a fireman, and ten of the crew. They had not been afloat two hours before a full-rigged ship sailed past them. At three o'clock on Friday morning a brig saw them, but lost them as she tacked, and went on her way. At daybreak a cutter was sighted and a shirt hoisted on an oar to attract her attention—in vain. Then the barque came by, sighted them, and picked them up, and, after a stormy voyage, brought them safe to Falmouth.

RIVALS:

THE STORY OF AN EVENTFUL PAPER-CHASE.

By HERBERT P. DOLLMAN

CHAPTER II.

MALTON HOUSE was not the only school in Thetfield. The town boasted another establishment of equal size and importance. But the inmates of Malton House held the Priory School to be a very inferior place, and equally contemptible to the Priory scholars was Malton House. When, therefore, pupils of the two establishments happened to meet, there was always an exchange of very doubtful compliments.

The principal of the Priory was Dr. Bottrell; his pupils, when cricketing, always wore blue caps. These two facts were quite sufficient to obtain for the Priory fellows the nickname of "Blue-bottles;" they, in return, dubbing the Malton House boys, I do not know why, "Pussies."

Now the Priory fellows had had very recently a grand paper-chase, and had been so very triumphant in their speeches about it, that Malton House made up its mind to indulge in a paper-chase too. And, the permission of Dr. Whatman obtained, a date was fixed and all Malton House was thenceforward in a ferment. Enough paper was torn up to form scent for use on half a dozen occasions. At recess time, even tilting was given up, and the playground was filled with boys running round and round it at the top of their speed.

One or two even took the trouble to measure parts of the recreation-ground in order to gauge correctly their speed and endurance. Not content with this, Fred Poynter, whose "big brother" was a great man at amateur athletics, and had taken several prizes at Lillie Bridge, said he should go in for serious training and be very careful in his diet. This announcement of his was greeted with cries of "So shall I!" from a score of fellows. So that at dinner-time so many potatoes were left uneaten, so many plates of jam pudding even remained undevoured, that Mr. Marston, who always presided at the table, imagined some demonstration was intended against the cook, and made inquiries as to the meaning of this unprecedented event.

Well, it was not a matter of very great importance whether they took their pudding and potatoes or whether they did not, for a boy, luckily for himself, runs an ostrich very hard in the strength of his digestion. The best result of it was that a little self-denial was called into play, although Watkins, that incorrigible young glutton, whose nickname was "The Alderman," suffered from a bilious attack

owing to the number of helps of pudding he consumed after appropriating them from his abstaining comrades.

The appointed day came at last, and that morning the masters had a troublesome time of it with the restless young spirits under their charge. But the excitement rose to a climax after dinner, when the lads, all, with one exception, in their football costume, assembled in the playground. Our friend the Alderman had loudly proclaimed for the past week his intention to run in his ordinary everyday garments. It was all nonsense, he said, putting on jerseys and the rest of it. That was all very well for football, but, just for running, why they were not wanted, and he should not put them on. So there he was, in his jacket suit, boasting that he would show them all that he could run just as well in that as they could in their football attire.

There had been a little hesitation at first as to the hares. Danvers and Butler would have been the men, of course, but every one saw that it was quite impracticable to get them to act together. After a good deal of discussion, Poynter and Carson had been appointed. They were good runners, and it was their boast that, owing to the attention they had given to training, they were in better condition than anybody.

It was not a bad day for the chase. The air was cold and the sky cloudy, as wintry skies are apt to be, but that was of no consequence. Chilly though it might be to the boys while standing about, when once they were in motion their keenness would be all the better. Poynter and Carson were quite ready, with their big linen bags full of "scent" slung at their sides. They were fuming with impatience to set off, but were put out of their misery at length. Then down the road they went, and turning the corner were soon out of sight.

If the hares had been impatient, how much more so were the hounds! It seemed to the eager crowd thronging round the school gate a wondrous long ten minutes that intervened between the starting of the hares and the moment when the Doctor let them off in pursuit. At his signal, away they sped.

Have you ever taken part in a paper-chase? If so, there is little need for me to describe the delight there is in careering over the country roads, down the lanes, across the fields, jumping over the stiles and ditches that come in the way, with the fresh air blowing round you,

and your limbs all glowing with the jolly exercise. A merry-hearted crew they were that day as they bounded along full of health and spirits and bent on catching the hares if they were to be caught anyhow.

There were two among them, above all, who meant to do their best. All foresaw that there would be a pretty keen competition between Danvers and Butler. Danvers, who was still sore with the recollection of that tilting defeat, had determined not to be outdone by his rival. And he went ahead at such a pace that he was soon the leading hound. Butler, equally intent on triumph, was going to work in a different way. He kept well to the front, but did not put his greatest speed on at once, and after the first mile and a half, Danvers, glancing back, noticed his position, and began to have an inkling of his intentions. So he altered his plan, and relaxed his speed in such a degree that, while he maintained the advantage gained, he was enabled to husband his strength to pit against the effort to overtake him, which he rightly guessed was to be made.

By this time the hounds were scattered a bit. No longer was there any semblance of that line in which they had been drawn up at starting. The youngsters were beginning to fall in the rear a little, and—alas! for the Alderman. That young gentleman, unaccustomed to such exercise as this, or to voluntary exercise of any kind, had soon lagged behind, although, to justify his boast, he had tried hard to keep up with the rest. His plump legs became more and more weary, he grew more and more scant of breath, and, habited as he was in a thick winter suit, he perspired, spite of the temperature, in a most distressing manner, so that presently his running degenerated into a sort of amble, and the amble into a walk, ending in a full stop. The derisive cries of those who saw him halt came faintly borne on the wind to him as they ran farther and farther away, and he sat down, very disconsolate, on a stile, gazing moodily after them. But a smile stole peacefully over his face as the idea occurred to him of tacking back to the town and reviving his drooping spirits with a feast of "Turkish delight" at the sweetstuff-shop. Inspired with which notion, he sprang to his feet and retraced his way, bounding along like an indiarubber ball. While the Alderman thus ingloriously gave in, the others kept gallantly on. And presently Butler,

thinking the time had come, shot forward. He fancied Danvers was getting a bit fagged from the change in his pace. Not a bit of it, as the spurt which he made showed at once!

A little accident favoured Butler, though. Danvers tripped over a tuft of grass, and though he was quickly up, Butler had meanwhile come within a couple of yards of him. Now it was a race if you like! They came to a gate. Danvers jumped over it clean and gained two or three yards on Butler, who could only pass it by vaulting. But the latter quickly recovered his place. Recovered his place! Ay, did more! He shot ahead of Danvers for a few steps. Not for long. In a few minutes they were side by side. Each was trying his utmost to outrun the other. Vainly the fellows behind shouted out to them not to go on at such a tremendous pace; they paid no heed to these cries. Concerned as any of the others might be about the straggling of the pack, they did not trouble themselves about it.

The one idea prevalent in the mind of each of them was not to let himself be outstripped.

In jumping over a ditch Butler slipped on the farther edge. He happened to be just in front; the passage-way was narrow, and Danvers falling against him as he leaped, both tumbled into the muddy water! This, luckily, was not deep. They were out again in a moment, and, beyond a wetting of their feet and legs, no harm was done. But neither was in a humour to bear even this pleasantly, and angry words were banded between them as they ran, until, finding that it interfered with their progress, they ceased their unprofitable discussion, and, with eyes keenly looking for the patches of "scent" which marked the course taken by the hares, flew along side by side.

They came presently to a roughly-made stile at the end of an uphill path, so that even Danvers could not jump it. The path diverged on the other side into two worn tracks, one going straight on, the other passing at right angles by the side of the hedge. They did not notice this, however. They saw a patch of scent ahead, clambered over the stile, and on they went. A little while after, they heard shouting behind them again, but, as before, disregarded it, continuing their race at the top of their speed.

Past some farm-buildings, down a great hill-side covered with clumps of gorse, along in the valley a little while and then up the opposite hill, skirting a small plantation, then along a rough cart track, and striking off again by the side of some ploughed land and over some bare stubble-fields, they followed the course marked. Sometimes Danvers led, sometimes Butler. They were always close to one another. Their pace was not what it had been at first. The exertions they had made had taken a good deal of "go" out of them, but they were pretty equally matched and stuck to it pluckily.

Presently something wholly unlooked for happened. They had noticed, though neither of course spoke to the other about it, that the scent latterly had been more sparsely scattered. The intervals between the patches were greater and the patches themselves were smaller, until one was passed consisting of three little pieces of paper only. And after that there seemed to be no more. The way

appeared to be clear, however; they were going down another hill, and the trail had previously bordered the hedge, which went in a pretty straight line down its side. So they kept on, though they came to no more scent, and gradually the impression that they were going wrong stole over them. Yet neither opened his lips to say so. At last Danvers stopped.

"Look here, Butler," he said, "it's humbug going on. It's plain we've lost the scent."

Butler only stayed a moment.

"You can do as you like," he said. "If you are done for, I am not. There'll be scent right enough presently, and I'm going on."

Danvers was not the fellow to stand being spoken to in this fashion.

"Done for!" he exclaimed, wrathfully. "I'll keep on as long as you will, anyhow."

And he set off again with such an increase of energy that he passed Butler and kept the lead too.

How long they would have continued this foolish contest it is impossible to say, but the hedge came to an end presently. A bare open piece of down lay before them, and both felt it would be sheer folly to go on.

So that when Danvers called out, without stopping, "Which way are you going now? or do you see yet that we've gone wrong?" Butler made a desperate effort, came up abreast of Danvers, and then said,

"I don't care which way. We'd better stop, I suppose, and go back to that last bit of scent."

And stop they did, and back they went accordingly. They reached the three little slips of paper at last, a little out of breath with their climb up the hill, and looked around for indications of more, but none could they see.

And the two lads, placed in a dilemma as they were, stood looking about, obstinately maintaining silence, afraid to consult one another for fear of compromising their dignity!

You must know that for the past month, at least, they had not spoken to each other at all, and before then had been by no means on cordial terms. If any one had been at hand to indulge in a hearty good-natured laugh at their expense, I believe they would have been shamed into joining in it and would have become better friends. However, it was absurd to go on looking about like this for ever. They explored the place pretty thoroughly, and then at last Danvers, as Butler approached him after making a wide circuit, said,

"Well, there's nothing more about here, that's evident. These bits must have got blown here by the wind. I'm going back to the next lot, to see if there's any scent round it anywhere."

Butler made no answer, though presently he followed. They searched round the next lot of papers; to no purpose. Then it occurred to Danvers that the scent having given out, the hares were hiding, and he expressed curtly his opinion to that effect.

"We should have found them if they had been," Butler answered, shortly.

They were silent again and stood about in rather an aimless fashion till Danvers said,

"What are you going to do?"

Butler did not answer for a few min-

utes. Then he said in a surly sort of way,

"There's nothing to do but wait for the others to come up."

It was all very well to say this, but time passed and there was no indication of the approach of any of the pack. Danvers began idly kicking at the bits of paper with his foot. Suddenly he bent down and examined some of them minutely. Then, jumping up, he exclaimed, impetuously,

"We've been a couple of nice duffers!"

Butler looked at him superciliously.

"Speak for yourself," he said.

"I'll speak for us both!" retorted Danvers. "Look at these bits of paper! They are exercise books torn up, but not the books we use. Our paper is whiter. And what's more, look at this bit. See that name on it? Thistleton! That's the captain of the Bluebottles' first eleven! We've been following on a wrong scent. This is some old trail of the Bluebottles!"

He was right. This was precisely what they had done. If they had not been so intent on outrunning one another, they would have noticed, on getting over that stile spoken of just now, as the rest of the pack did, that there were two lots of scent. There was some going straight on, which they had followed, and which was the trail laid by the "Bluebottles" three days back in another chase; and there was some distributed along the path at right angles to the one crossed by the stile, dropped there by Poynter and Carson. If they had turned their eyes to the right then, they would have seen, and in five minutes have come up with, the hares. Poynter, looking back, had seen the two rivals as they tore fiercely on, following the "Bluebottles" trail, and he and Carson were in high glee over it. Danvers and Butler learnt this afterwards. At present they did not know how it was they had gone astray. But that they had done so was quite evident.

Then what was to be done? Butler settled that question.

"I'm not going back by that trail," he said. "We shall be a long time getting home at that rate. I shall make for that road at the bottom of the hill."

Had Danvers thought that the route marked by the trail was the shorter way back he would have followed it, letting Butler go by the road if he liked. But both fancied that the latter would be more direct. They were mistaken, for the road in question led to Thetfield in a circuitous manner, passing through one or two villages first. Ignorant of this, they turned and went down the hill again. The difficulty, when they reached the road, was to settle in which direction to go, to the right or to the left, for they were not acquainted with the country. They had paid no attention to the landscape as they raced along, had consequently quite lost their bearings, and now there was not even the sun to guide them. Just a little to their left they saw a milestone. It did not prove much of a guide, for all they found marked thereon was "Thetfield 7 miles." They agreed to continue in the direction in which they were going, and then, side by side, without any further exchange of words, walked on.

It was not very comfortable for them. They were quite uncertain whether they were going right or wrong. They felt,

sold, too, for a cutting north wind had risen. It was getting dusk, and the thick clouds covering the sky had an ominous look about them suggestive of coming snow. That mile seemed a very long

one. By-and-by, though, they perceived with pleasure a white spot by the roadside, and increased their pace in their anxiety to ascertain if they were proceeding aright. An unpleasant discovery

was in store for them when they got up to it.

"Thetfield 8 miles," said the milestone.

(To be continued.)

A FACE AT THE WINDOW.

A STORY OF THE LIMITED MAIL.

IT was a cold bright night in the early part of February, and the Limited Mail was speeding its way north. The passengers had settled down to a long ride, and had made themselves as comfortable as circumstances permitted. Those within range of the lamp-light pulled out their evening papers and began the perusal of the *rechauffé* of the morning's news, which they had already devoured.

"Not much in the papers to-night," remarked Mr. Barker to the company generally.

He was a stout little gentleman, evidently communicative.

"What have you got?" asked his friend Smithson, who was sitting opposite.

"The 'Globe.'"

"So have I."

A stranger here joined in the conversation. He was tall and spare; he looked like the typical Yankee.

"Have you the last edition?" he asked. "If so, you'll find as pretty a little story on the third page as you'll meet with in a month's reading."

"The escape of that convict?" inquired Mr. Barker.

"Yes: he's a plucky fellow."

"He's a consummate scoundrel, at all events," remarked Mr. Smithson: "a well-known burglar, and more than suspected to have been a murderer."

"Yes, I'm afraid he's a bad lot," said the American; "I wish he weren't. If he gets away he saves himself ten years' penal servitude: 'twas worth the risk."

"How did he manage it?" asked Mr. Barker. "I haven't read it."

"Broke out of the prison van," replied Mr. Smithson. "Watched his opportunity and stunned the policeman inside, got the keys, let himself out, and bolted. It shows what a desperate man can do."

"Will they catch him?"

"That remains to be seen: the police are on his track," replied the American. "I should like to be there when they try to capture him."

Nothing could have been further from his thoughts than the possibility of his having to take part in the capture himself. The three men settled down to their papers again in silence.

"What's that?" suddenly exclaimed Mr. Barker.

"What is it?" inquired the others.

"I'm certain I saw a face outside the window," he replied.

"The reflection of one of us," suggested his friend.

"Perhaps 'twas the guard going by," said the American.

"If so, the guard isn't wearing a cap," said Mr. Barker, moving towards the window.

"Got it blown off, perhaps," said Mr. Smithson. "Pray don't open the window: we shall be frozen to death."

But Mr. Barker let down the strap and peered out into the darkness.

The engine was throwing up a shower of sparks, and the blaze from the fire illuminated the tender. Those windows which had no blinds drawn threw a dim light on the hedges, but otherwise there was darkness.

"Anything there?" queried Mr. Smithson.

"I fancy I saw something."

"Well, do settle about it one way or the other, and shut the window."

Mr. Barker withdrew.

"I'm certain I saw a man's head," he asseverated. "And I'm nearly sure I caught sight of something moving when I looked out."

"Haden't you better call the guard and stop the train?" asked Mr. Smithson, ironically.

Mr. Barker did not reply, but looked uneasily into the darkness.

He had not been mistaken. A man, hatless and coatless, had passed along the foot-board of the carriage. He had given a quick glance into the compartment, and seeing it occupied by four men had hastily passed onwards.

The next compartment out one was labelled "Ladies," and was tenanted by one lady only. The convict, for it was he, stopped in front of this. With a dexterous movement he opened the door, and before the lady knew what had happened she saw a desperate looking ruffian standing beside her.

"Don't be frightened, miss," he said, "I ain't going to harm you: I've no time. I want some money. It's life or death to me, and I must have it. Your purse, quick!"

She glanced at the little handle which was the means of communication with the guard: the convict was standing between her and it. There was nothing to be done. She drew her purse from her hand-bag and gave it him.

He put it in his pocket and in a moment was outside the door again.

Instantly she flew to the handle and pulled it with all her might again and again. Then the fright she had undergone overcame her, and she sank on to the seat, unable even to go to the window and give the alarm.

The convict had acted with the sagacity and daring which had made so many of his enterprises successful. He had calculated that his victim would give the alarm directly he left her. This was what he wanted.

It would have been madness for him to go on to the next town. He knew that men were on the watch at every station for him. He had mounted the train at the risk of his life as it had passed slowly through one of the tunnels in the north of London, before it was free from the network of intersecting lines. He must somehow escape before it reached a stopping-place.

But to leap from the Limited Mail meant probable death, certain disablement. If, however, the train could be stopped he might slip down unseen between the carriages and make his escape with a fair chance of success.

It is not usual, however, to stop a train on a signal by the communication. The bell aroused the attention of the guard, but all he did was to lean out of his window to see if there was any sign that it was necessary to do more.

There was nothing to show that the ringing implied more than a practical joke, such as is sometimes indulged in by those who have subsequent cause to regret it. He was on the point of drawing in his head when he saw a white shawl being waved from a window. The lady had recovered sufficiently to drag

herself to the side of the carriage and open the shawl.

This was enough: the guard put on his break and signalled to the driver to slacken. In half a minute the pace was palpably slower.

"What's up now?" exclaimed Mr. Barker, springing to his feet. The others followed him to the window.

They had not hitherto noticed the fourth occupant of the compartment. He was a well-built, tall man, but apparently very uncommunicative. He pushed his way to the window and looked out.

He uttered an exclamation, and to the surprise of his companions flung open the door and began making his way along the foot-board.

The others followed his course in wonder. What did it all mean?

He had seen the shawl hanging from the window. He knew to whom it belonged.

He was travelling north with his sister, and rather selfishly, though with her full consent, had put her into a ladies' compartment whilst he enjoyed a cigar in a smoking carriage. He had intended rejoicing her at the first stopping-place. No wonder he was anxious when he found the train stopping and saw his sister's shawl.

The pace grew slower and slower. The convict bided his time. What was the good of hurrying? No one would care to follow him in the dark.

He had calculated without a knowledge of all the circumstances. Half a dozen words told Mr. Fairbairn, the fourth occupant of the smoking compartment, what had happened to his sister. He looked around as she spoke, and distinctly saw a man drop on to the rails from a carriage near the end of the train and make for the country.

Without a moment's hesitation he leaped to the ground and followed him. The Yankee was at the open door, a not uninterested spectator. Mr. Barker had seen the convict's escape and gave the alarm. In another moment all three were after him.

Mr. Barker and his friend soon gave up the pursuit. They were elderly and quiet business men, by no means fitted for a midnight steeplechase across country. But the American was stronger and accustomed to wild life: the excitement of the chase seized him, and he was soon close on the heels of Mr. Fairbairn.

Nothing could have surprised the convict more than the fact that he was pursued. He soon saw, however, that he was. He still had about him the weapon with which he had stunned the policeman: he determined to put it to further use as he saw Fairbairn gaining on him.

The country was too open for concealment, and the grey dawn was beginning to brighten the horizon. The convict grasped his weapon and prepared to receive his pursuer.

What would have been the result it is useless to guess: at any rate, Fairbairn would not have stopped. But the American caught him up and put his hand on his arm.

"Don't you go for him," he said; "it's not worth while you're getting damaged. I think I can persuade him."

Fairbairn tried to shake his adviser off, but in vain. The convict was about to make a fresh bolt for liberty, seeing there were two

against him; but the American's voice called him to stop.

"If you don't, I'll fire!" he cried, and the click of his revolver showed that his threat was not a meaningless one. The convict had no choice but to obey.

"Throw down that thing," ordered the American. He was obeyed: the short iron bar was dropped.

"Now march back to the train. No games, remember, or 'twill be the worse for you."

A few minutes later the convict was in a luggage van, securely barred in. At the next station he was handed over to the authorities for reconveyance to London.

Needless to say the American was welcomed effusively by his former companions, who congratulated him on his success.

"Well, perhaps it was not I so much as this little toy," he said, complacently. "It's a bad habit I got into years ago when I used to live among a wild lot out West."

"Is it loaded?" asked Mr. Barker, nervously, eyeing the weapon uncomfortably.

The American smiled, and there was a merry twinkle in his eye that suggested more than his words.

"Well, now that you come to mention it, sir, really I don't believe it is!"

H. M. P.

THE LEYDEN JAR; AND HOW TO MAKE IT.

OUR mention of the Leyden jar in the "Storm in a Teacup" article in our Christmas Number has led to several inquiries how to make it. Nothing can be easier.

Procure a smooth glass bottle, that is to say an unpatterned one; and let it have a wide mouth, though this is not essential. Thoroughly clean it and dry it and paste on to it inside and out to the height shown in the illustration some sheets of tinfoil. Let the tinfoil cover the glass two-thirds or what not from the base, and leave no breaks below the line.

The best plan is to coat the inside first. Cut a circular piece of tinfoil a little larger than the bottom of the bottle, and paste it down with the edge pressed up against the side. Then drop into the bottle a well-pasted strip of foil the height you have selected, and just a trifle longer than the internal circumference of the glass on which it is to be stuck.

Having finished the inside, do the out. Cut a circular plate for the bottom, press it up round the edge and paste on the glass the strip for the exterior circumference, which should be of the same height as that inside. Then insert a piece of brass through a cork or mahogany stopper, fix a brass ball to one end and a brass chain to the other just long enough to rest on the bottom, wax or varnish the stopper, and the jar is complete.

Instead of lining the bottle with tinfoil,

thin gold leaf or copper leaf can be used; and instead of the brass ball and bar a ball of baked wood and a copper tube. It was Harris who first used the baked wood; Hopkinson has experimented with Leyden jars in which sulphuric acid has taken the place of tinfoil! The form we have described is, however, the usual one, and as it is the cheapest it would be best to start with it.

To charge the jar the outside tinfoil is connected with the ground, and the inside is excited by means of the knob from the prime conductor of the machine. The electricity is, as the phrase goes, "bottled off," though "the fluid" is no fluid, and is not "poured" at all. Two conductors of large surface are separated by a rigid insulator, and hence the conditions are favourable for powerful attraction. That is all.

This simple apparatus, which takes such a prominent part in electrical experiments, obtained its name from having been invented at the old Dutch University, where Muschenbroek was at the time professor. In Germany it is called Kleist's jar, from the name of another inventor, but it has been the custom amongst us to ascribe the honour of invention to either Muschenbroek, or Cuneus, his assistant.

It seems that Muschenbroek had noticed that excited electrics soon lost their electricity in the open air, and that this loss was quickened when the atmosphere was charged with moisture. Hence electricity was retained by surrounding its retainer with bodies that did not conduct it. To prove this he poured some water into a glass flask, put it into communication with the prime conductor of an electrical machine, and for fear of accidents judiciously handed it over to Cuneus to hold. When they thought it was charged enough Cuneus tried to disconnect the chain from the conductor, and thereupon received such a lively shock in his arms and chest that he dropped the bottle and smashed it to pieces.

The professor was pleased; the assistant was not. He was ill for two days afterwards. "I would not take another shock for the kingdom of France," he wrote to Reaumur. And all the first experimenters with electrical apparatus were much alarmed at shocks which to us would seem hardly worth noticing. Poor Winkler, for instance, was so frightened at the unexpected experience that he "betook himself to cooling medicines to allay the fever."

The shock received by Cuneus soon led up to the jar as we now know it. First water was tried, then mercury, and finally tinfoil. Muschenbroek's experiments took place in 1746; in the next year Watson began to come to the front. He first fired gunpowder by electricity, then he mixed camphor with gunpowder and discharged muskets by electricity. Then hydrogen and spirits of wine were fired by the spark by means of a drop of water or a lump of ice.

Watson it was who put the inside and outside tinfoil coatings on the jar. Bevis suggested the outside; Smeaton, of Eddystone Lighthouse fame, suggested the inside. Watson's experiments before the Royal Society attracted much attention to the science, though he had in some things been anticipated by the French, who had sent a discharge through twelve thousand feet, and on one occasion had used the great basin of the Tuileries, giving an acre of water as part of the circuit.

Nollet sent a discharge from a jar through a regiment of fifteen hundred men holding each other's hands, and they were all shocked in the arms and shoulders. But perhaps the best known experiment is that of Franklin with his kite.

Two strips of cedar, fixed crosswise, with a large silk handkerchief tied at the corners, and a sharp-pointed wire projecting a foot above the upright, was all that Benjamin Franklin's famous kite consisted of. It had an ordinary paper tail, a bellyband, and a

long fine string, with a short piece of silk ribbon tied at the end. Just where the ribbon was knotted to the string he hung a key.

It was in June, 1752, when he let his kite up in the thunderstorm. He and his son, after some little difficulty, got it out to the full length of the string, and then stood up inside a doorway to keep the ribbon dry. A thundercloud passed over, and nothing seemed to happen. The experiment promised to be a failure. Gradually, however, the loose filaments of twine began to stand out at right angles, and were found to be attracted by the fingers; then a knuckle held to the key extracted a spark from it, and as the string got thoroughly wet in the pouring rain the electricity became abundant. With it the experimenters charged the Leyden jar, whose discharges afterwards proved the identity of the electricity of the thundercloud with the electricity of the machine.

Another famous experiment is that known as Lichtenberg's figures. It is generally performed as follows. Hold the jar, charged positively, in the hand, and with the knob draw on a glass plate, cake of resin, or sheet of vulcanite, a series of patterns. Then put the jar on an insulator, and, lifting it by the knob, trace another series of patterns with the outer coating, so as to cross and intertwine with those made by the knob.

Having designed the patterns, make a mixture of red-lead and flowers of sulphur and dust it on to the slab. A curious thing will happen. The red and yellow will sort themselves out. The sulphur will stick to the positive lines, the lead to the negative ones, and the pattern will be given in two well-marked colours. The sulphur will be in tufts, the lead in spots. In mixing the powder the sulphur became negatively electrified, the red-lead positively so, and hence the disposition of the materials.

The terms negative and positive were first used by Symmer as alternatives for resinous and vitreous. Symmer was the man who discovered the electricity in his stockings and charged the jar by their aid. His experiments were the same in principle as those of Cigna with his silk ribbons, but were much more astonishing.

When Symmer pulled off his stockings he noticed that they often gave a crackling sound, and when he undressed in the dark he saw sparks issuing from them. When he wore silk stockings for show and worsted beneath them for warmth the effects were more powerful. When one stocking was drawn out of the other they appeared inflated, and attracted and repelled each other like electrified bodies!

He experimented with a pair of white silk stockings and a pair of black silk stockings. When he wore both white or both black on the same leg nothing happened, but when he wore a white and black on the leg, and pulled them off after ten minutes or so, they remained inflated, and showed the shape of his leg! Brought within eighteen inches of each other, they rushed together; then they were separated, and again became inflated, and again rushed together.

Experimenting with the two pairs held against each other, he found that they sorted themselves out, rushing each to each, until they gradually wasted away, and from legs substantial enough for the foundation of a family ghost story—a ghostly legacy—dwindled down into mere flabby pieces of silk. The electricity he obtained from these classical stockings was considerable. He charged a Leyden jar from the four of them, and secured enough electricity to shock himself up to his elbows, and to light a teaspoonful of spirits of wine!

But we are trenching on the text-books. One caution before we conclude. In every experiment, whether it be merely in shocking, in rendering luminous half a dozen eggs placed end to end by sending the shock through them, in perforating a card by passing a spark through it as it rests on the foil,

in splitting wood by driving the wires in until their points are close to each other, in breaking a glass by passing a spark from knob to knob in water, however simple it may be, remember always to discharge by touching the outside first. Otherwise you may receive an unpleasant surprise, and, like Cuneus, come to grief with your Leyden jar.

THE MUSICAL GLASSES.

THE harmonicon is not a very difficult instrument to make. It consists of a box and a series of plates—of metal, stone, or glass—to give the sounds.

Take a piece of deal free from knots and shakes, and plane it smooth and true. Let

FIG 1

it be of the shape of Fig. 1, three-sixteenths of an inch thick, six and a half inches wide at the top, four and an eighth inches wide at the bottom, and twenty-three and a half inches along the side which is at right angles to the ends. The slope will be just a trifle longer.

This piece of wood is for the bottom of the box. Now for the sides. Make them out of quarter-inch stuff, twenty-three and a half inches long and one inch and five-eighths wide. For the ends take two pieces of three-eighths stuff an inch and five-eighths wide; and let one be six and a half inches and the other four inches long. For the tops, as

FIG 2

shown in Fig. 2, take two slips a quarter of an inch thick and two inches wide at one end and an inch and a half wide at the other.

Let the wood be as perfect in quality and equal in thickness as possible, and glue up the box—without the tops—as evenly as you can. The box can be nailed or screwed if you think it will be easier for you, but the result will not be so satisfactory. The box is like a fiddle, and the more of a perfect shell it is the truer and fuller will be the sound.

In the centre of the box glue in the bridge, which will be about five and a quarter inches long and half an inch wide, and should stand clear of the bottom and clear of the tops. Then in the broad end at two and a quarter inches from its sides cut the slots, as shown

FIG 3

FIG 4

in Fig. 3; and at the other end, as shown in Fig. 4, cut the slots one inch and a quarter from each side. Below each slot is shown a small circle. This represents the head of the

screw or tack round which the twine is strung on which the musical plates are to rest.

For the string use very fine twine, crochet cotton, or silk, and stretch it very tightly and fasten it off at the end it started from; that is to say, fix it at the broad end under the tack, then pass it under the tack at the narrow end, then under the other tack at the narrow end, and then bring it up to the broad end and there finish it off. It should be very tight and just rest on the bridge in the middle.

The next thing is the glass, which should be cut in inch strips, and fixed on to the strings with a drop of sealing-wax. Let us have eighteen notes ranging from B to E in the key of C. The true dimensions and position will have to be found by experiment, but for glass a sixteenth of an inch in thickness the following will be found the suitable lengths. B should measure five and three-eighths; C, five and a quarter; D, five; E, four and seven-eighths; F, four and five-eighths; G, four and a half; A, four and three-eighths; B, four and a quarter; C, four and an eighth; D, three and three-quarters; E, three and five-eighths; F, three and a half; G, three and three-eighths; A, three and a quarter; B, three and an eighth; C, three and an eighth; D, three and an eighth; E, two and three-quarters. These are the lengths for glasses an inch in width.

The glasses should be laid on the strings, which gradually approach each other, and they should be shifted about until the correct note for each is obtained. In Fig. 1 we have shown how they rest on the strings, and in Fig. 2 we have boxed them in and shown by the space at the end how they may have to be closed up to keep the proper intervals. As soon as the notes are right, fix the glasses on to the string with a tiny drop of sealing-wax. And also fasten the string on to the bridge with wax so as to make everything secure. Then glue on the tops to hide the ragged ends, and the harmonicon is complete. For the hammers glue a piece of cork or wood on to a length of whalebone or split cane, or any springy stick about eight inches long. A convenient shape is that shown in

FIG 5

Fig. 5, where the black head represents the cork cut to a wedge.

Although many tunes can be very pleasantly played on this simple instrument, do not let it be supposed that it at all resembles the harmonica for which music was written by the great composers. That was a different affair altogether. Perhaps a few notes concerning it may not be uninteresting.

One of the first allusions to an instrument of the sort is by Harpsdrfer in 1677, though among savage nations, Burmese and what not, rock, bone, and wood harmonicas have existed for ages. On St. George's Day in 1746, Gluck played a concerto on twenty-six drinking-glasses, "tuned with spring water." The instrument was of his own invention, and he played it accompanied by the whole band. It was said to be capable of producing all the effects of the violin and harpsichord.

When Benjamin Franklin was in London in 1762 he saw Puckeridge and Delaval amusing themselves by playing tunes on ordinary drinking-tumblers. The tumblers were tuned by the water poured into them up to different levels—the higher the water the lower the note—and were sounded by wiping a wet finger round their brims. Franklin was so much struck with this that he straightway took the matter in hand and invented the harmonica, for which the music used to be written, and of which a specimen now rests in the South Kensington Museum.

The harmonica—Franklin called it the "armonica"—consisted of a series of glass

bells fixed in regular order on an iron spindle made to revolve like a lathe with a treadle. The sound was produced by pressing the wet fingers on the bells as they rotated, and it could be increased or decreased in volume and tone by varying that pressure.

Franklin presented his invention to the Davies family, with whom he was connected, and one of them, Marianne, performed on it with great success in London, Paris, Florence, and Vienna. The constant thrilling of the fingers affected her nerves, however, and she had to abandon it, just in the same way as had Naumann, the composer, who "found it necessary to restrict himself to practising."

Some of the music played by Miss Davies was specially written for the instrument by Hasse, and when, in 1791, the blind Kirchgässner went to Vienna, Mozart wrote an adagio and rondo in C for harmonica, flute, oboe, violin, and violoncello. Who in these days would imagine that the "musical glasses" once stood so high in the world?

Three years afterwards Kirchgässner came to London, and there played on a new harmonica built by Fröschel. At Darmstadt the harmonica held its place in the Court orchestra, and C. F. Pohl "professed" it. Beethoven even condescended to write for "the glasses," and Naumann's half-dozen sonatas for them still exist.

The instrument, however, has been laid on the shelf—or rather consigned to its case as a curiosity—and the musical glasses of to-day are the harmonicon we have described and the tumblers performed on by itinerant minstrels at street corners. These are easier of arrangement than our glass slips. Simply procure a number of glass cups or bowls, make them give forth different notes by pouring in different quantities of fluid, so as to check their vibrations, and then proceed to hammer or wipe them, as may seem best to you.

BY THE POND.

Ah! that looks something like a slide!
Well polished, only two feet wide.
In length a hundred yards or so,
And not a particle of snow.

Down go the boys; just watch the pace;
One boy looks on with envious face.
'Tis Jenkins: though he's often tried
He somehow *cannot* learn to slide.

The others shoot off like a dart,
Head back, feet not too wide apart;
And Jones can travel at a pace
To put a skater to disgrace.

But Jenkins butaps his flattened nose,
He hurts his knees and spoils his clothes;
And once he bent his fingers back
So far he thought he heard them crack.

He polishes the shiny track
By sliding down it on his back,
Or treats it as one treats a seat,
But he can't keep upon his feet.

[A]

A Scotchman doing Highland reels
Flings pretty high his active heels,
But Jenkins sends his higher still
When comes the inevitable spill.

He's given it up; he's had enough;
He trots home in an awful huff;
And almost hopes, just out of spite,
A thaw will spoil the frost to-night!

PAUL BLAKE.

CONJUROR.—The book is unknown to us, and is not in the catalogues. We have had many articles in our columns, and shortly hope to give a series on that subject.

W. P. M.—There are workshops for practical carpentry at King's College. Advertisements of carpentering schools appear occasionally in "Amateur Work."

A. N. P.—The increase in the population is sure to increase rent and prices. In the days of Henry VIII., although the labourer received only sixpence halfpenny per day, yet he could pay his rent for the year with six or eight days' work, earn a cow in three weeks, a quarter of wheat in a fortnight, and a pig in seven days.

S. YARD.—It would take too long to work out all the questions, but here is something like what you want. The 35,000,000 of our population annually spend £500,000,000 on food, and consume upwards of 300,000,000 quarter loaves, 93,000,000 cwt. of potatoes, 17,000,000 cwt. of vegetables, 30,000,000 cwt. of meat, 700,000,000 lb. of fish, 5,000,000 cwt. of butter, 2,000,000,000 lb. of sugar, 170,000,000 lb. of tea, 1,000,000,000 gallons of beer, 37,000,000 gallons of spirits, and 14,000,000 gallons of wine.

SAILER No. 1.—It is impossible to say without seeing the lines of the boat; but, speaking generally, the foresail for a sprit-rig is best fastened to a short iron bowsprit projecting a few inches from the stem-head. If you want a longer bowsprit you must get your mainsail farther aft, and this you cannot do unless you fit it with a gaff and boom instead of a sprit.

S. P. G. K.—You require no licence unless the boat is for hire. So long as your garden goes down to the water's edge you are all right, but you cannot land elsewhere without paying pier and other dues.

P. 1.—Shorthand books cost only a shilling or two. Apply to Mr. Pitman, Paternoster Row. 2. The first volume costs six shillings. 3. Do not know the gentleman's name. The Empress of China is the important personage now.

ASTER.—The articles on Waterton's method of bird-stuffing were in the August, September, and October parts for 1883.

TELEPHONE.—We never give an opinion in such matters. A boy's position and capabilities must in nine cases out of ten be better known to his friends than to strangers, and to them it is you should apply for advice as to your future occupation. It would be better if we could all choose the work we are best qualified to do; in the majority of cases, however, we have to take what we can get, and gratify our special gifts in our hobbies. Employment in the telegraph companies is generally obtained through the telegraph schools, such as the one in Princes Street, Hanover Square.

A CRICKETER.—In Nos. 231 and 232 you will find articles on how cricket-bats are made, and a reference thereto will give you the information as to splicing.

P. P. S.—You can get the "book of the words" of Punch and Judy from French, bookseller, Strand, W.C. As you have the puppets, and know the order of their exits and entrances, and the general business, why not make it up yourself? It would not take you long to compose such a libretto.

SID.—The wetter the flowers were gathered the worse they will keep. They want well drying when under pressure. Do not use gum or paste, as that is sure to discolour them.

K. H. C.—1. You want a reversing eyepiece. The instrument behaves exactly as was intended; all "astronomical telescopes" show their objects upside down. Your glasses are all right. 2. Use dumb-bells weighing about a couple of pounds, and do not give more than two shillings for them.

T. MAY.—Certainly; the Great Council of the Nation both elected and deposed the monarchs. In 755 it deposed Sigebert of Wessex, and appointed Cynewulf instead; in 1013 it deposed Ethelred II.; in 1037 it deposed Hardicanute; in 1327 it deposed Edward II.; in 1399 it deposed Richard II.; in 1688 it deposed James II. In 866 it elected Ethelred instead of his elder brother; in 871 it elected Alfred instead of Ethelred's son; in 925 it elected Athelstan instead of his legitimate brother; in 946 it elected Edred instead of Edwy; in 955 it elected Edwy instead of Edred's son; in 1042 it elected Edward the Confessor instead of Ironside's brother; and in 1066 it elected Harold, and ignored the old house altogether. The numerous instances since the Conquest you can pick out for yourself.

G. S.—It is not impossible. Some years ago Mr. Rolt wound off the silk from twenty-four garden spiders, and obtained 18,000 feet of it only the 30,000th of an inch thick. Gloves and stockings of spider silk were at one time manufactured in France.

A. A.—1. The rook differs from the crow in having the base of its bill covered with a rough scabrous skin. 2. The present Pope, Vincenzo Pecci, was born in 1810.

C. D. V.—To clean white straw hats dissolve some salts of lemon in a pint of boiling water, wash the hat with the hot solution, hang it up to dry, and before it is quite dry press it with a hot iron. You can get sufficient salts of lemon for a penny, and your hat will look quite new again.

G. G. M. H.—Read our articles on "Fishing Tackle and how to make it" in the third volume.

MENTHOLA.—The series of articles on Bees and Bee-keeping was in the second volume.

D. GARDNER.—You have mistaken the ages given for officers with those for foremast hands. Any postmaster will give you a pamphlet of instructions how to join the Navy. There is a depot at Hemming's Row, at the back of the National Gallery.

G. TAYLOR.—The ink must be scraped off, and the table re-polished.

A BERKSHIRE LAD.—1. In all the colonies you can buy land by paying a certain portion of the price as a deposit, and spreading the balance over a term of years. 2. The cost of the land depends on its quality and position, and the preparation it requires. 3. Speaking generally, about three pounds per acre as against thirty. 4. Our own colonies can offer every advantage; why go to a foreign State? 5. An English farm labourer's wages range from a pound a week downwards. In Australia a steady man who knows his business can earn from two pounds a week upwards. That is the difference.

PHAROAH can turn to page 451 in the May part for 1881, and there he will not only learn how to make the serpents, but to spell the name.

W. F. T.—There should be nothing weakening in a cold morning bath, but with some delicate constitutions it may not always be desirable.

Art and Criticism.

No. 319.—Vol. VII.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND
CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy,"
etc., etc.

CHAPTER XXXII.

SOADY was at Mr. King's earlier than usual next day, for he had taken a holiday on the strength of the bazaar. He had come to fetch Garland.

"It was flying up with the velocity of a comet."

"Hurry up, my archbishop in embryo," he said; "there's lots to do before Sir Robert proclaims the affair open and gives the public permission to ruin themselves without reserve. Where's Lang?"

"He's in the library; do you want him?"

"Rather; I've got a message for him. Mrs. Hawtrey wants to know why he didn't turn up yesterday, and we're to bring him with us to have lunch at her house at twelve o'clock. Lucky I had an early breakfast, wasn't it?"

Lang heard Soady's voice and came into the room. Soady delivered his message.

"Thanks. I don't think I can come," said Lang.

"Why, what's the hindrance? Aren't you well?"

"Not very; and I've some work to do."

"But you know the doctor told you not to work too hard," persisted Soady; "you'd better come."

But Lang declined, and Soady could not press the point, so they started without him.

No sooner had they gone than Lang threw himself back in his chair, leaving his books unopened.

"I wish I were dead," he said to himself, sadly.

Soady was puzzled at Lang's refusal to accompany them. "Tisn't as if he had a lot of work to do by a given day; he won't have to sign his articles till he likes. I'm afraid his head is going, aren't you?"

Garland did not reply; he seemed in a reverie.

"Don't you think so?" repeated Soady.

"Eh? I? I'm afraid I didn't hear what you said. I was thinking."

Mrs. Hawtrey welcomed them very kindly. Her house seemed thrown open to the world; the rooms were full of people who were to take part in the opening ceremony or the succeeding sale. There were an M.P. and a couple of deans, and various small celebrities, so that the two friends felt themselves rather smaller than usual. But Mrs. Hawtrey had the gift of putting every one at ease, and Soady was soon explaining in detail to a young lady the subjects of the tableaux.

An adjournment was made soon after lunch to the schoolroom, which had a gay appearance. It was hard to imagine that it was the same place where Meggie had witched their souls away the night before. Flags were hung about in profusion, the stalls were arranged for display, flowers and plants filled the corners and gave a pleasant cool look. A fountain had been arranged at one end of the room, and in the basin below gold and silver fish swam swiftly about.

"How pretty they look," said Soady's latest friend, Miss Richardson.

"Yes, a great deal too pretty to be eaten, perhaps that's why they never cook them."

"Who has lent them?"

"No one," replied Soady; "they are for sale. Everything in the room is for sale. Look at those kittens with the label on their necks."

Miss Richardson drew near to inspect. The pretty little soft balls of fur were each placarded, "Please buy me, or I may be drowned to-morrow."

"What a shame!" she exclaimed.

"Yes," acquiesced Soady, "it does seem rather hard on them, doesn't it?"

"I'll buy one of them," said Miss Rich-

ardson. "I couldn't bear the thought of their being drowned."

"Thank you," said Soady; "they are only five shillings." He took the money and handed over a white kitty.

"I'm glad that my suggestion has been so successful," he said, complacently. "I thought people wouldn't be able to resist that appeal."

"Do you mean to say," exclaimed Miss Richardson, "that you put that placard on?"

"Yes," replied Soady; "it wasn't a bad idea, was it?"

Miss Richardson seemed uncertain for a moment whether to be angry or not, but her good-nature prevailed, and she began to laugh.

"You said everything was for sale, and this is a sell," she remarked; "but I shall have my revenge, so take care."

Soady learnt later on what she meant. She beguiled him into purchasing a smoking-cap (he didn't smoke) at fourteen shillings, the facsimile of which he saw next day on a stall marked four and sixpence. But, as he told Garland, it was in a good cause, so he didn't care.

Garland was cashier, and made a round of the stalls every two hours to collect the cash, which he then took to the vestry of the adjoining church and counted. He had just finished one instalment, and tied it up carefully in chamois-leather bags, when something curious occurred.

A concert was being held in a side room, and it had been found that there were not enough seats. A messenger had been sent in hot haste to a contractor, ordering the immediate delivery of a lot of rout seats or chairs.

As Garland stood at the vestry window for a moment the chairs were being brought in. The face of one of the porters seemed familiar to him.

"Where have I seen that fellow?" he thought. "I know his face perfectly."

He thought over all the working men he knew, but could not identify this one. He waited till the young man should return to the van; then he would have a better glimpse of him.

No sooner had Garland caught sight of his full face than he started back in amazement.

"Melhuish!" he exclaimed.

He drew back out of sight. What should he do? Go out and speak to him? That would scarcely be wise. Supposing Melhuish saw himself recognised, he might fear discovery and bolt. No, the wisest plan would be to go more quietly to work.

He could see the van from the door of the vestry; he took a careful note of the contractor's name and address.

"I'll look him up to-morrow," said Garland to himself, "and see what I can do for him. Poor fellow! he doesn't seem to have been making his fortune."

CHAPTER XXXIII.

"THEY don't work you so hard as this at the office, do they, Mr. Soady?" asked Miss Hawtrey, with a smile, when evening had come and the crowd began to throng the stalls.

"It's a different sort of work," replied Soady, "and the hours are not quite so long; but this is the pleasanter," he added, gallantly.

"Won't you take some refreshment yourself? I'm sure you must need some."

"I think I will now you suggest it. I hadn't thought of it."

For the last hour or so Soady had appeared in a new character—that of bottle-opener in chief to the refreshment stall. He had his best coat on, and a beautiful little bouquet (which cost him half-a-crown) in his button-hole, so he was not quite in a state to handle dirty lemonade bottles; but he stuck to his work, and in return his work stuck to him, for lemonade is one of the stickiest things on earth.

"I wish I could take off my coat," he confided to Garland; "but I suppose it wouldn't be quite the thing."

"I'm afraid not, unless you could get out of sight."

"I did try to hide, but this lemonade is so tremendously up that unless you have the tumbler close at hand you lose half. Directly you slip the wire, the cork is up like a rocket."

"I've heard a report to that effect," said Garland; "have you had any accidents?"

"Only two. One cork hit the dean on the head, but he thought it was a piece of plaster from the ceiling, and sent out to get a man to inspect it. I ought to have owned up, but I shirked; besides, I had a big order on just then."

"What was the other accident?"

"Ah, that might have been a nasty one. There was one bottle that looked as if it was ready to burst, but when I took off the wire and eased up my thumb, nothing happened. So I brought a corkscrew to bear on it, and I couldn't stir the thing. Then I shook the bottle to try and raise the wind, and before I knew where I was, the cork, with the corkscrew in it, was flying up with the velocity of a comet."

"Damage anybody?"

"No; fell into a globe of goldfish and made them scatter, I can tell you. Mrs. King told me I really must be careful, as if I'd shied it up out of pure amusement. Have some lemonade?"

"Yes, I think I will," said Garland.

"All right; there's a bottle. Open it yourself and see how you like it."

As the evening advanced the crowd became thicker and the heat greater. Immense business was done, though chiefly in the smaller articles. Garland was glad to find his "pile" increasing. If things went on as well as this the required sum would be more than obtained.

He found himself obliged to concentrate his attention on his business when he was checking the returns from each stall. His thoughts were continually wandering. He could not get Melhuish's face out of his mind. When for a moment he managed to do so he found himself thinking of Lang.

It was easy to see that Melhuish had passed through trouble, and that even now he was in need of help. It was not so easy to see how to help him, yet Garland had resolved to do his utmost to give him aid.

For he had now taken upon himself, so far as it lay in his own power to do so, the profession of a clergyman, and had devoted his life to doing what good he could in the world. He was humble enough to know that it is not the simplest thing to do. He saw already how many mistakes were made by good people who went blindly though earnestly to work to do good to others. He saw that

to help Melhuish would require care and delicacy. He could not go to him and say, "You must go home at once." But, happily, he knew how in every time of need and perplexity to look up in simple trust to a Higher Power and seek the strength never asked, in humble faith in Christ, in vain.

No; supposing he were the same boy as he was when at St. Mary's it would be of little use for him to be put into respectable paths again; he would only sink once more, and cause more pain and anxiety than before. If only he could be brought to see the error of his ways! That would be the reformation needed; the rest could come after.

So Garland resolved to move cautiously; to say a word to no one. Then when he should see Melhuish he could inspire confidence by telling him his secret was safe.

But, unexpectedly to Garland, he had another duty to perform before he was able to seek Melhuish. It was a duty which he dreaded, though he knew it must be performed. He must have a talk with Lang.

There was a terrible suspicion in Garland's mind, and he could not rest satisfied till he had cleared it up. He dreaded doing it; he tried to persuade himself that it was no business of his; that Lang would justly resent any interference with his private affairs; but he could not thus satisfy himself. He must speak.

The opportunity came earlier than he expected. The bazaar next day did not open till two, but Soady and Mr. King, who were both on the committee, had to be at the schoolroom by twelve. Garland stayed behind for an hour's reading. Lang was in the house, and had promised Soady he would come up some time in the afternoon.

"Yes, mind you do," said Soady; "you'll have no end of a time and pick up some things awfully cheap. I saw a splendid wax doll go for two and a penny last night. I'd half a mind to buy it for Belle."

"I don't hanker after wax dolls," said Lang, with an attempt at a laugh; "but I'll try and come."

"That's right. I shouldn't bring too much money if I were you, for they fleece you rather—if you don't take care. I've only eighteenpence with me to-day, and that's going in refreshments; I've done my duty by this show; I shall be hard up till pay-day comes round. Good-bye. I must be off now."

Lang looked wistfully at him, but settled down to his work. He was reading a law book, and didn't seem to make much progress.

Garland had a Horace before him, but was only pretending to work. He felt his heart beating great thumps. He wished himself miles away. But he set his teeth, and by pure force of will calmed himself. Then he spoke to Lang.

"Been feeling better lately?"

Lang looked up. He half hoped Garland was going to talk a bit. He liked talking to Garland, though he always felt more ashamed of himself than usual afterwards.

"Yes, thanks," he replied; "I think I'm getting all right. The doctor says there's nothing much the matter with me."

"That's right; you find you can work now without feeling the effects?"

"Oh, yes. I've been trying to stick at it lately. How do you get on?"

"Pretty well on the whole. I'm floored

just now, though; that's what made me interrupt you. I wish you would give me a hint about this bit."

Lang laughed. "Not much good my hints, I'm afraid."

"I don't know about that; you managed your exam. first-rate, anyhow."

Lang gave a start. He hoped Garland had not noticed it.

"I must look out," he thought. "I've got the credit of knowing more than I do, so I had better keep it up as well as I can." Unhappy boy!

Meanwhile Garland had pushed his book across the table. Lang did not observe that the title was covered with a piece of manuscript laid carelessly over it.

"I shan't make much of a job of it unless I've seen it before," he said, looking at the lines Garland was pointing at.

"Perhaps you have seen these?"

"No," replied Lang, looking carefully at them, "I never did that ode, I'm certain."

He tried, however, to construe the lines. They were not easy, and he made a terrible mess of them. He gave it up at last.

"You mustn't come to me for off-hand translations," he said; "it's too bad. It's a very different thing to get up a few odes by heart for an exam. from reading off anything that's put before you."

Garland looked at him silently, and then took the paper off the book.

Lang said nothing, and made no sign of any sort.

"Do you see what it is?" asked Garland.

"Yes; Horace."

"Are you quite sure you have never seen it before?"

Lang looked up now in earnest. His lips were parted in terror, and his face became white.

"That ode," continued Garland, pointing to the lines Lang had never seen, "was the very one that was given for translation at the last matriculation."

Lang opened his mouth as if to speak, made an inarticulate sound, and then let his head fall on his hands over the table.

It was true, then. Garland knew now he had made no mistake.

But the greatest difficulty was before him, and should he make a mistake now it would be serious. He acted on the impulse, and laid his hand on his shoulder.

"Lang, old man," he said, gently, "hold up your head. 'Tisn't the time to cry now, you've something better to do."

But Lang would not show his face, and still sobbed with his head on his arms.

"Come," said Garland, "don't despair. It's bad enough now, but not so bad as when you knew it and no one else did."

"I wish I were dead," sobbed Lang.

"Thank God you are not," said Garland. "You've time to repent, and mean to do it. Be thankful that your one great sin hasn't gone on hidden and made your life miserable."

"It's made me the most miserable fellow on earth," said Lang, chokingly.

"All the more reason that you should be glad it's over."

"But it isn't over," cried Lang, suddenly lifting his head and looking wildly around. "It never will be over; I've done it, and it can never be undone."

"Don't say that; it's never too late to repent of an evil deed."

"Repent!" cried Lang. "What else have I been doing for the last four months and more? Hasn't my life been one long purgatory?"

Garland interrupted him. "Are you ready to take the consequences of your repentance?"

"What do you mean?"

"I mean, are you only sorry you did it because you are afraid of being found out, or are you ready to be found out and bear the consequences, sooner than go on as you have been—even if you make your fortune by this fraud?"

Lang hesitated, and Garland's belief in him gave way for a moment.

"I wouldn't go on as I have been doing if I knew I should become Lord Chancellor."

Garland held out his hand and Lang took it in both his.

"Then we are friends," said Garland, "and you will come out of this business better than you went in."

"I couldn't come out of it worse," said Lang; "and if you'll stick by me I don't care what they do."

"We'll hope for the best, and be ready to endure the worst. We must talk this over to-night; there's the bell for lunch. I'll come back at nine."

"I'll come and fetch you; I shan't go to the bazaar this afternoon after all."

"All right, I'll be ready."

"You don't know how different I feel already," said Lang. "What a fool I've been not to tell you before!"

"I'm not the only one to be told," said Garland, gently.

Lang knew what he meant.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XIX.—THE WONDERFUL GROTTO.

IT was indeed Templar when he awoke. The interview was most affectionate. The horse seemed to be as much pleased as his master at again meeting his travelling companion.

After breakfast Cyprien felt well enough to mount and set out. Barthes put all the baggage on Templar, and then took him by the bridle and led the way to Tonaia's capital.

As they went along Cyprien told his friend more in detail of the principal events of the expedition since leaving Griqualand. When he came to the final disappearance of Matakia, whose description he gave, Barthes burst out laughing.

"Oh!" said he; "that is news! I can tell you something about the thief if not about the diamond!"

"What do you know?" asked Cyprien, much surprised.

"This," replied Barthes, "that hardly twenty-four hours ago my Basutos took prisoner a young Kafir, whom they

good-sized huts, some of them almost elegant in shape, bearing outward signs of ease and affluence. The king's palace,

Entering Tonaia's Palace.

found wandering about the country, and handed him over bound hand and foot to my friend Tonaia. I fancy he would have made it hot for him, for he doesn't like spies, and the stranger evidently belonged to a tribe at war with his. But his life was saved! Fortunately they found out that he knew a little hanky-panky business, and was something of a medicine man—"

"That must be Matakai," said Cyprien.

"Well, he got off easily," said Barthes. "Tonaia has invented all sorts of punishments for his enemies; but you need not be in the least alarmed for your old servant. His reputation as a wizard protects him, and you will see him this afternoon in excellent health."

The news could not be otherwise than grateful to Cyprien. He would, after all, attain his object, having no doubt that if Matakai had the diamond in his possession he would hand it over.

The two friends continued in conversation as they crossed the plain which Cyprien had galloped over on giraffe-back a few days before.

In the evening Tonaia's capital appeared in sight, lying like a huge amphitheatre on the side of a hill which formed the northern horizon. It was a regular town of from ten to fifteen thousand inhabitants, with well-marked roads and

surrounded by high palisades, and guarded by black warriors armed with assegais, occupied almost a quarter of the city.

Barthes had only to show himself for the barriers to fall before him, and he and Cyprien were immediately conducted across a series of large courts to the hall of ceremony, where the "invincible conqueror" sat in state, surrounded by his officers and guards.

Tonaia was about forty years of age. He was tall and well built. A sort of diadem of boars' teeth was on his head, and he wore a red sleeveless tunic, and an apron of the same colour richly embroidered with beads. On his arms and legs were numerous copper bracelets. His face showed intelligence and refinement, but he had a crafty, hard-hearted look.

He accorded a grand reception to Barthes, whom he had not seen for some days, and in it Cyprien shared, as the friend of his faithful ally.

"The friends of our friends are our friends," said the chief.

And learning that his new guest was not very well, Tonaia bestirred himself to install him in one of the best rooms in the palace, and to provide him with an excellent supper.

Acting on the advice of Barthes, all

mention of Matakai was deferred till the morrow, when Cyprien had sufficiently recovered to appear before the king.

The whole court was assembled in the great saloon of the palace. Tonaia and his two guests were in the centre of the circle. Barthes opened the negotiations in the language of the country, which he spoke fluently.

"My Basutos," he said, "have recently brought to you a young Kafir. The young Kafir turns out to be the servant of my comrade, the learned philosopher, Victor Cyprien, who trusts to your generosity to surrender him. And I, as he is my friend and your friend, ask you this favour."

As soon as Barthes began his speech Tonaia assumed an appropriate diplomatic air.

"The great white philosopher is welcome!" he answered. "But what ransom does he offer for my prisoner?"

"An excellent gun, ten times ten cartridges, and a bag of beads," answered Barthes.

A flattering murmur ran round the audience in recognition of the splendour of the offer. Tonaia alone did not appear dazzled at it.

"Tonaia is a great prince," he said, rising on his throne, "and the gods watch over him! A month ago they sent Pharamond Barthes with his brave warriors and wonderful guns to help us conquer our foes! That is why, if Pharamond Barthes desires it, the servant shall be given over safe and sound to his master."

"And where is he at this moment?" asked the hunter.

"In the sacred grotto, where he is guarded night and day," answered Tonaia, with all the importance of one of the most powerful of the Kafir chiefs.

Barthes translated the reply to Cyprien, and asked the king's permission to go with his companion and seek the prisoner in the grotto.

As he said so there was a murmur of disapproval among the assembly. The demand of the Europeans seemed unreasonable. Never under any pretext had a stranger been admitted within the mysterious grotto. A cherished tradition declared that the day the white men learnt the secret the empire of Tonaia would crumble to dust.

But the king was not particularly pleased at his decisions being prejudged in this way, and the murmur induced him, from mere caprice, to grant what without it he would probably have refused.

"Tonaia is the blood-brother of Pharamond Barthes, and there is nothing he need hide from him! Can you and your friend keep an oath?"

Barthes nodded affirmatively.

"Then," said the Kafir king, "swear to touch nothing that you see in the grotto! Swear to live ever afterwards when you come out as though you had never known its existence! Swear to never seek to enter it again, nor even to attempt to do so! Swear that you will tell no one what you will see!"

Barthes and Cyprien raised their hands and repeated word for word the formula of the oath that had been delivered to them; and then Tonaia gave a few orders in a low tone, the court rose, and the guards formed into two lines. Slaves brought in a few pieces of fine linen, with which the eyes of the strangers were bandaged. Then the king sat down be-

tween them in a large palanquin of straw, which several Kaffirs lifted to their shoulders, and then the procession moved off.

The journey was quite long enough; it took nearly two hours. From the motions of the palanquin the friends made out that they were being carried over hilly ground.

Then the coolness of the air and the echo of the steps of the escort resounding from walls quite close together indicated that they were journeying underground. Then the puffs of resinous smoke which floated into their faces told them that torches had been lighted to show the way.

A quarter of an hour afterwards the palanquin was unshouldered. Tonaia made his guests step out, and ordered their bandages to be removed.

Dazzled with the light after so long a darkness, Barthes and Cyprien thought at first they were the prey of some ecstatic illusion, so splendid and unexpected was the sight that greeted their eyes.

They were in the centre of an immense grotto. The ground was covered with fine sand bespangled with gold. The vault was as high as that of a Gothic cathedral, and stretched away out of sight into the distant darkness. The walls were covered with stalactites of varied hue and wondrous richness, and from them the light of the torches was reflected, flashing back with all the colours of the rainbow, with the glow of a furnace fire and the wealth of the aurora.

Colours the most dazzling, shapes the most extraordinary, dimensions the most unexpected, distinguished these innumerable crystals. They were not, as in most grottoes, pendants, monotonously similar to each other, but nature had given free scope to fancy, and seemed to have exhausted every combination of tint and effect to which the marvellous brilliancy of the rocks could lend itself.

Blocks of amethyst, walls of sardonyx, masses of rubies, needles of emeralds, colonnades of sapphires deep and slender as forest pines, bergs of aquamarine, whorls of turquoise, mirrors of opal, masses of rose gypsum, and gold-veined lapis lazuli—all that the crystal kingdom could offer that was precious and rare and bright and dazzling had served as the materials for this astonishing specimen of architecture; and, further, every form, even of the vegetable kingdom, seemed to have been laid under contribution in the wondrous work. Carpets of mineral mosses soft and velvety as the finest gauze, crystalline trees loaded with flowers and fruits of jewels recalling the fairy gardens of Japanese art, lakes of diamonds, palaces of chalcedony, turrets and minarets of beryl and topaz, rose pile upon pile, and heaped together so many splendours that the eye refused to grasp them. The decomposition of the luminous rays by the thousands of prisms, the showers of brilliancy that flashed and flowed from every side, produced the most astonishing combination of light and colour that had ever dazzled the eyes of man.

Cyprien doubted no longer. He beheld himself transported to one of those mysterious receptacles whose existence he had long suspected, in which nature stored and crystallised wholesale those precious gems which she only gives to

man in favoured spots and in fragmentary and isolated specimens. For a moment he was tempted to doubt the reality of his vision, but as he passed a huge heap of crystal he tried to scratch it with the ring on his finger, and found the attempt was in vain. The immense crypt was built up of genuine diamonds, rubies, and sapphires, and in masses so prodigious that their value was beyond all calculation.

Only astronomical numbers could be called in to give an approximate amount. In fact, there, buried in the earth, unknown and unproductive, lay a mass of wealth that could be reckoned only in trillions and quadrillions.

Was Tonaia acquainted with the enormous wealth he here possessed? Probably not. Even Barthes, who knew little about such matters, did not suspect for a moment that the marvellous crystals were precious stones. Most likely the Kaffir king thought himself simply the master and guardian of a particularly curious grotto, whose secret an oracle or some traditional superstition forbade him to reveal.

One thing seemed to confirm this opinion. In several corners of the cave Cyprien noticed heaps of human bones. Was this, then, the burial-place of the

Barthes was of the latter opinion, and whispered to Cyprien,

"Tonaia told me that since his accession nothing of this sort had occurred, but the sight of those bones rather shakes my confidence in him," and he pointed to a huge heap that had been recently formed, and which bore obvious marks of having been cooked.

The impression was confirmed a few minutes later.

The king and his guests reached the end of the grotto, before an opening which ran back into a recess similar to one of the lateral chapels in a basilica. Behind the iron grating which shut it in there was a wooden cage; in the cage was a prisoner. The cage was just large enough to allow him to crouch, while—the fact was too obvious—he was fattened up for an approaching feast!

The prisoner was Mataki.

"You! you! Pa!" exclaimed the unfortunate Kaffir as soon as he recognised Cyprien. "Take me with you! Deliver me! I would rather go back to Griqualand and be hanged than remain in this poultry coop for the horrible punishment Tonaia intends before he eats me!"

This was said in such a pitiful voice that Cyprien was quite moved at it.

"Be it so. Mataki," he said; "I can

"They were journeying underground."

tribe, or—what was more horrible and more probable—did they here shed human blood in the rites of sacrifice or the practice of cannibalism?

obtain your liberty, but you cannot come out of that cage until you have given up the diamond—"

"The diamond, Pa!" interrupted the

Kaffir—"the diamond! I have no diamond! I never had it! I swear it! I swear it!"

were tried with the wands they said that I must be the thief, and that I had acted as I did to disarm their suspicion. When

"Fattened for an approaching feast."

He said this in such a tone of truth that Cyprien had no doubt of his veracity. Besides, he had always doubted that Mataki was the thief.

"But then, if you did not take the diamond," he asked, "why did you run away?"

"Why? Because when my comrades

in Griqualand you accuse a Kaffir you know it is not long before he is sentenced and hanged; and, for fear that they should catch me, I ran away, as if I had been guilty."

"He is speaking the truth, I think," said Barthes.

"So do I," said Cyprien; "and perhaps he was not far wrong in getting out of the way of Griqualand justice."

Then he turned to Mataki. "Well, I do not doubt your innocence, but at Vandergaart Kopje they will not believe you when you tell your story. Are you willing to take your chance, and go back?"

"Yes; I will risk everything rather than remain here!" said Mataki, who seemed a prey to the keenest terror.

"We will see about it," answered Cyprien—"my friend will do so at once."

And Barthes stepped up to the king.

"Speak out," he said. "What do you want for the prisoner?"

Tonaia reflected for a moment, and then said, "Four guns, ten times ten cartridges, and four bags of beads. That is not too much, is it?"

"It is twenty times too much, but Pharamond Barthes is your friend, and he will give you what you ask;" and then he stopped for an instant, and continued, "Listen, Tonaia. You shall have the four guns, the ten times ten cartridges, and the four bags of beads; but you shall give us a team of bullocks to take us back across the Transvaal, with the necessary provisions and an escort of honour."

"That I will do," said Tonaia, in a tone of complete satisfaction.

Then he whispered confidentially into Barthes's ear, "The team is all ready. They came out of your friend's waggon when my men came across them on their way home."

The prisoner was at once handed over; and after a final glance at the splendours of the grotto, Cyprien, Barthes, and Mataki were blindfolded and returned to Tonaia's palace, where a grand banquet was given in honour of the treaty.

It was agreed that Mataki should not appear immediately at Vandergaart Kopje, but should remain in the neighbourhood and re-enter the engineer's service when he was sure it was safe to do so.

On the morrow Barthes, Cyprien, Li, and Mataki departed with a numerous escort for Griqualand. But the Star of the Settlement seemed to be irretrievably lost, and Mr. Watkins might as well give up his idea of sending it to the Tower of London to sparkle among the crown jewels of Great Britain.

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy-Earl," etc.

CHAPTER XI.—(continued.)

THE soldier came forward, saying, "Ivan Ivanovitch Dobroff, I believe?"

Little Ivan was thunderstruck, and could make no reply.

Brother Angelo stepped forward, and asked the soldier haughtily why he disturbed the child and what he wanted.

The soldier replied that he had orders to secure the person of the boy and to take prisoners all who should attempt to retain him and keep him from the custody of the police.

"And who are you?"

"Sergeant of gendarmes, in command of a party under orders to carry Ivan Ivanovitch, commonly called Ivan Dobroff, a pupil of the First Gymnasium of Moscow, to the commander of police at Kursk."

"You must show your authority to the Archimandrite. No other person has any power to deliver up any one who has become an inmate of this house, and we stand immediately under the Metropolitan of Moscow, whose orders are superior to those of any police-master."

"There is no necessity for my showing

anything but my soldiers," said the sergeant. "However, I do not wish to be hard upon monks or upon the boy. I will, therefore, go with you to your 'Igum' (abbot). Show the way and be sharp about it, as I have to catch the train to Kursk."

"But I won't go with you!" exclaimed Ivan. "I have done no harm, and I don't want to go to Kursk. I want to go to Moscow to Mr. Smirnoff."

"Quite so," said the soldier. "You are the boy we want quite exactly described. I hope his eminence won't be angry,

because, you see, we are only doing our duty and obeying orders. So if he will be kind enough to help us we shall be glad, but if not—why, what is to be done?"

The brethren now came flocking to see so unusual a sight as an armed man within those peaceful walls; and soon it became current news in the whole brotherhood that Ivan was to be carried off by the police. He was always a mystery. What had he done? Was he, at that tender age, a Nihilist? Impossible!

At last the servitor of the Archimandrite came down to say that his master would see the police officer directly. Would he walk in? Oh, yes, he would, but still keeping his hand on Ivan's shoulder.

On entering the room in which the Archimandrite had first interviewed Steinfeldt and Ivan, the sergeant sat heavily down on one of the large chairs as if he were performing some very serious act to which he was not accustomed, but which, notwithstanding, he meant to go through with. He sat square on the chair as though he were afraid of breaking it by resting all his weight, and therefore only occupied the extreme verge of the seat. He retained his helmet until the entrance of the Archimandrite, at sight of whom he first sprang up into an ultra-erect attitude, assuming a military bearing, and making a most military salute. But the appearance of the venerable figure was too much for him. The soldier was forgotten—for the moment—in the man, and he fell on his knees before the abbot, removing his helmet as he did so, which he placed beside him, and, crossing himself devoutly, at length prostrated himself entirely before the man whose sanctity was a household word all through the district and beyond. The abbot advanced to the prostrate soldier and extended his hand,

which the sergeant saw, and, raising himself to his knees, kissed. The Archimandrite then made the sign of the cross over him, and he rose to his feet.

"You have come, my brother, armed with authority to remove a very young lamb from the fold. I trust you will be careful in guarding him so that no harm may befall him. He has become very dear to us."

"Your eminence, I will answer for the boy's life with my own! Will you please to see my papers?"

"Certainly," said the abbot; "but I do not doubt their accuracy."

He sat down on the sofa while the soldier showed him his orders, which were to proceed to the monastery of Kupsk and from thence to bring the person of the Gymnasist Ivan Ivanovitch Dobroff.

"But," said the abbot, "is Ivan's name Dobroff? I never knew he had a surname."

"Is there no surname on his passport?"

"He has no passport," answered the abbot, calmly.

"No passport!" exclaimed the gentleman—"no passport! How could you take him in without a passport?"

"I did not think it mattered, as he is under twelve years of age."

"Not matter!" exclaimed the soldier, all the policeman in his heart being alarmed at this fearful breach of discipline. "Such a thing has never happened in Russia! I dare not take him without a passport."

"Then leave him here," said the Archimandrite. "We don't want you to take him away."

"My orders are imperative. I am to take the boy. There he is; there is no mistake about it. But without a passport I never receive even the lowest prisoner! I must ask my men what they think."

So the sergeant went to his troopers,

who were all as much puzzled as he at the new phenomenon of a boy without a passport; but it was resolved that as he was of more importance than the document he should be taken without that formality. The men were admitted, and rode clanking and jingling into the court, which perhaps now for the first time rang to the sounds made by armed men. They were hospitably regaled on porridge quass (a beverage like very thin beer made with bread, and greatly affected by all classes in Russia) and such things as the monks could lay hands on. Ivan's wardrobe was packed in a neat box, which was strapped on to the back of one of the horses. A spare horse had been provided for him. And when the troop had well supped the men all begged the Archimandrite to give them his blessing and pardon for taking away "his little boy." They then mounted, and putting the boy in the centre, trotted off from the monastery, the abbot standing in the gateway.

As long as the troop was in sight the almost spectral figure of the abbot might be seen solemnly blessing both captors and captive. The moon had risen, and the pale rays fell on helmet and accoutrement as the forms of the horsemen receded from the view, and the same mystic light showed the unearthly pallor of the abbot's face still more strikingly ghost-like.

The unwonted excitement was too much for his gentle frame, still more unnerved by fasting and vigil. When the little band of troopers had passed quite from view, and the last gleam had been reflected from the metal adornments of their dress, his strength failed him, and he was borne back to his chamber by the united efforts of Brothers Angelo and Ambrosius, assisted by a crowd of officious monks.

(To be continued.)

A SCHOOLBOY'S ADVENTURE WITH MOONLIGHTERS.

BY JAMES COX, R.N.,

Author of "Fascinated by a Fakir," "How I Saved My Aunt's Diamonds," etc.

CHAPTER I.

JUST as the last batch of Dr. Jonas's young gentlemen was leaving Blenheim House for their Christmas holidays a smart little telegraph-boy suddenly appeared at the door of the worthy Doctor's house, where that gentleman was standing shaking hands with his departing pupils, and, after giving him an oblong envelope of a brownish-red colour, as suddenly disappeared.

"Dear me, what can this be?" said the Doctor, fumbling in his pockets for his spectacles. "One moment, boys. Ah, let me see."

From Captain Brown, To Dr. Jonas,
Hampshire Regiment, Blenheim House,
Portsmouth. Clifton.

Am ordered to proceed to Malta immediately in the Crocodile, in place of a brother officer. Ship sails at noon. Tell Reggy he must remain with you during vacation. Will write by next post.

"Ah!" said the kind-hearted man, handing the telegram to a handsome dark-eyed boy who a few seconds before had been busily employed strapping a

portmanteau; "I'm afraid, Reginald, this will be very disappointing to you."

Disappointing, indeed! The poor boy looked crushed, but he managed to gulp down the choking sensation that would arise in his throat, and looking up in the Doctor's face, said,

"I must try to make the best of it, sir."

The Doctor hurried away to his study, leaving the boy to the commiserations of his schoolfellows.

"Don't look so glum, old fellow," said his chum, Charley Fitzgerald, a lively young Irishman.

"Ifancy you wouldn't look very cheerful yourself," replied Reginald Brown, "if you had to stick in this fusty old place instead of going home. Just imagine eating one of Sally Jonas's plum-puddings all alone on Christmas Day."

"Oh, it's too bad altogether, old man," chimed in Master Silas Cadbury, a regular Job's comforter. "I remember Biggs Senior told me that when first he came here some other fellow told him that a youngster in the first form

was left behind. He only managed to get through one week, then suddenly vanished. Anyhow, he was never seen or heard of again. Some said that he tried to kill himself by swallowing sticks of slate-pencil. At any rate, when the fellows came back to school all the pencils had disappeared from their desks. But good-bye; we must be off."

"Tell you what it is, Reggy," said Charley Fitzgerald, lingering on the doorstep; "I've just thought of something. Directly I get home the pater shall write and ask the Doctor to let you come over to Galway and stay with us. Good-bye, old man; keep up your pecker."

"Come along, Fitz!" shouted the other boys from the cab that was about to bear them off to the railway-station.

"Thanks, old chap," said Reggy, "you are a brick!" and, shaking his chum's hand, he turned into the house.

Giving his portmanteau to one of the servants, he wended his way to the deserted playground to think over the state of affairs.

It certainly was a great disappointment to Reginald Brown. He had looked forward all the half to spending his Christmas at Portsmouth with his father, and although naturally of a happy, cheerful disposition, and inclined to look on

board H.M.S. Crocodile, and after he had read the contents he brightened up considerably. The letter was as follows :—

H.M.S. Crocodile, Portsmouth,
3rd December, 18—.

My dear Boy,—My telegram, I fear, will have caused you some unhappiness, as I

by to cast the hawsers off in five minutes' time.

You must cheer up, my boy. I hope to meet you again before long, as I understand that I am to be offered a staff appointment at home in a month or two.

This news I only heard just now.

Your loving father,

PERCY BROWN.

P.S.—It is quite settled that you go to Sandhurst next year.—P. B.

"Presently the Policeman gave a low whistle."

the bright side of things, he could not help feeling down in the mouth. However, his chum's promise to get him an invitation to go over to Galway was some slight consolation, and so he determined, as he had told the Doctor, "to make the best of it."

The next day a letter arrived for him, from Captain Brown, dated on

know how anxious you were to see me before I left England. As you are aware, it was arranged that I should join my regiment next year, but the sudden illness of F—, just as his detachment was on the point of sailing for Malta, capsized this, and, in obedience to orders from headquarters, I am now proceeding to Malta in his place, or shall be in a few minutes, for I hear the captain giving directions to the sailors to stand

almost given up hopes of doing so, as recent reverses of fortune had made it doubtful whether his father would be able to afford the necessary expense.

The boy was tall for his age, fond of athletic sports, and full of pluck, both moral and physical—one of those lads who was not afraid to say "No" when it was right to do so.

He was by no means of a quarrelsome disposition, but there were one or two bullies at Blenheim House School who had felt the weight of his metal, and respected him accordingly. His mother died when he was almost a baby, but his father had early taught him the "beginning of wisdom," and also to "ride, shoot, and tell the truth."

In the course of a few days the Doctor received a letter from Colonel Fitzgerald, begging that he would allow Reggy to come over to Ireland and stay with him.

"I have no objection to your going, my boy," the Doctor remarked to his pupil, "but I am not quite sure whether Captain Brown would quite approve of your visiting Galway just now."

"Why not, sir?"

"Well—ahem!—the country is reported to be in a very disturbed state at present. The tenants, they say, have a mania for shooting their landlords."

"But, sir, they are not likely to mistake me for a landlord, are they?"

"No, no, my lad," chuckled the good Doctor. "There, I'll take the responsibility. Run off now, pack up your traps at once, and you'll be just in time to catch the Bristol steamer."

Reggy was off like a shot, and, having received all necessary instructions from the Doctor as to his journey, proceeded without delay to Bristol, and was fortunately in good time to secure a berth on board the steam-packet Juno, bound for Cork.

It was the first time he had been afloat, and he enjoyed the novelty immensely. Fortunately for him the weather was fine,

under the frowning guns of Forts Carlisle and Camden, the curtain of mist, through which the shadowy forms of the ships anchored in the roadstead were dimly visible, suddenly commenced to disperse beneath the rays of the morning sun, revealing the lovely scenery of Cork Harbour to the admiring gaze of Master Reginald.

Passing Spike Island, and then rounding the beacon on the harbour shoal, scattering the white-winged gulls from their perch on the buoys that marked the channel, the steamer slipped through the calm water, churning up great sheets of foam with her paddles, and sending long undulations inshore, which caused quite a commotion among the small craft moored to the wharves.

On the right the hills, dotted here and there with pretty white villas, swept upwards from the beach, and as presently they neared Queenstown, with its terraced houses and fine cathedral, the sunlight flashed on the pinnaled roof and gilded image of St. Colman, and then gleamed on the bayonet of the sentry pacing the forecastle of the great line-of-battle ship bearing the flag of the Port-Admiral. Now they have passed the round tower on Haulbowline, and are gliding up the placid water of the Lee, leaving Monkstown, Glenbrook, and the crowded docks at Passage far astern. Soon the river winds round to their left, and a few minutes after Blackrock Castle is in sight, and the towers and spires of the City of Cork are right ahead. A little later and the steamer is at her berth alongside the quay below St. Patrick's Bridge.

Young Brown found his way to the railway-station, and from thence he was borne swiftly by the "iron horse" westward to Galway, at which place he arrived rather late in the evening, after a long and cold journey.

On the platform of the station he met his schoolfellow and Colonel Fitzgerald waiting to receive him; and as he stepped out of the carriage Charley rushed towards him, shouting, "Here we are, Reggy! Welcome to old Ireland! This is my father; he's awfully glad you've come—aren't you, dad?" said the boy, appealing to the colonel.

and he escaped the penalty usually paid by landmen in the shape of offerings to Neptune. Very early the next morning the Juno was off Roche Point, and as she steamed between the headlands

"Very glad indeed. Your father was an old comrade of mine; we served together in India, and I'm delighted to have an opportunity of making the acquaintance of his son," replied the colonel, as he shook the boy warmly by the hand. "But now, my boys, come along; Mickey is waiting for us outside with the car, and we have a long drive before us."

"You jump up this side with me, Reg!" exclaimed Charley; "and hold on well, for Mickey always drives like fury!"

As Mickey cracked his whip, and the car commenced to rattle through the streets of Galway, a mounted policeman trotted out from the entrance of the railway-station, and, touching his cap to Colonel Fitzgerald, took up a position on the right side of the car.

"That's father's body-guard," explained Charley. "Whenever the governor drives out after dark he's obliged to have one of these chaps with him."

"I suppose he's a landlord, then?" said Reggy, remembering what Dr. Jonas had told him.

"No, he isn't; but he's Lord A——'s agent, and that's worse. Not that father's afraid of the cowardly fellows," continued Charley; "but, you see, it's just as well to be on the safe side."

By-and-by the car emerged from the town, and while the two lads were chatting together, and laying out plans for enjoying their holidays, unmindful of the bleak wind that whistled round their ears, Mickey was urging his steed along the road skirting the shores of Lough Corrib. Presently the road trended away to the left, and as the horse gradually slackened his pace Reggy noticed that they were ascending the mountain side, and that the few stars that had hitherto served to make the darkness visible were gradually being obscured by dark patches of cloud.

"Another five miles and we shall be home, Reggy," said his chum, drawing his collar well up. "This is the worst bit of road we have to get over. Our place is just the other side of the mountain."

Suddenly the policeman, who was now a little in advance of the car, gave a low whistle, at which signal Mickey pulled up his horse with a jerk that nearly precipitated the occupants to the ground. At the same moment the moon sailed over the crest of the mountain and showed the figure of the colonel's body-guard sitting motionless on his horse a few yards ahead of them, with his carbine levelled at something in the hedge on the roadside. There was a flash of light, and as the report of the gun broke on the stillness, Colonel Fitzgerald leaped from the car, followed by Mickey.

"By the rock of Cashel!" shouted the latter, as he jumped over the fence that separated the road from the bog, "you've done for the murdering villains this time."

"Is the poor fellow killed?" exclaimed

the colonel, in a concerned tone, as he prepared to follow.

"Killed!" shouted Mick, with a roar of laughter. "Shure, yer honour, it's cold mate the peeler's made of him. Faith! it's old Biddy Nolan's cow!"

The policeman protested it was impossible, and averred that he had heard a rustling in the hedge, and had distinctly seen in the moonlight the gleaming barrels of two rifles through the black-thorn.

"Thrue for you, peeler!" screamed

Mick. "The poor crater's horns are tipped with illigant brass ferrules; didn't I buy them same for Biddy last week in Galway?"

There was no getting over the fact that the policeman had made an unfortunate mistake in his zeal to protect the colonel, and that gentleman having satisfied himself that the cow was actually dead, remounted the car and desired Mickey to drive on.

Mickey, nearly choking with laughter, resumed the reins, and during the re-

mainder of the journey chaffed the policeman unmercifully.

"Shure, it's a crack shot ye are. Begorra! there ain't anither man in the Royal Oirish that 'ud hit a bull's-eye in the dark. Axin' the poor baste's pardin, it's the cow's-eye I mane."

"Quiet Mick!" said Colonel Fitzgerald; "don't bother the man. You must ride over to Ballybriggan Farm tomorrow, and find out what Biddy will take to console her for her loss."

(To be continued.)

RIVALS: THE STORY OF AN EVENTFUL PAPER-CHASE.

By PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy Earl," etc.

CHAPTER III.

THERE was something in the look of that big "8" which struck dismay into the hearts of the two boys. Danvers gave vent to a loud exclamation of disgust, and Butler could not refrain from a dismal grunt. The prospect was so very unpromising. Besides, they resembled in one respect that nightingale of the poet Thomson's which "began to feel, as well it might, the keen demands of appetite." They had made only a light repast at dinner-time, so as not to interfere with their running, and now they were decidedly "peckish." Moreover they had no money with which to get even a biscuit, for, in changing their ordinary garments for football costume, they had paid no heed to the contents of the pockets.

An eight-mile walk along this deserted road, after what they had already done, was not exactly an undertaking for which they had a relish. But there was no help for it. So they ruefully went back, observing from time to time with apprehensive looks the cloudy sky. They seemed to have been alone together for a very long time, and their companionship in this mishap was beginning to influence their bearing towards each other.

It had not been easy to interchange those few remarks which necessity had demanded, but these had paved the way for other observations not strictly called for. Not that the two rivals conversed cheerfully. Oh, dear no! their dignity would not allow of that. But, at rare intervals, there would pass between them some scrap of talk evoked by the generally disagreeable state of affairs.

Thus Danvers, after a glance at the dark sky, observed, tetchily, "And it's going to snow now on top of all, I verily believe!"

To which Butler, looking straight in front of him, and trudging on, made answer, gruffly, "Well, we must put up with it, I suppose!"

It was all very well for Butler to philosophise in this fashion, but when the snow came down, as it did presently, thick and fast, whirling round, settling on them and covering the ground with a white coating in a very little while, the situation was not at all pleasant.

With great satisfaction they reached that wretched seven-mile milestone again. How dark it had grown since they saw the thing first! It was quite as much as they could do to make out the inscription on it now. And the north wind blew pitilessly in their faces, and penetrated

through the thin clothing they had on, so that Danvers, after one or two involuntary shivers, said, "I vote we run;" and they quickened their pace accordingly.

It was a relief to Danvers, and he found himself so much to the fore that two or three times he waited for Butler to overtake him. This, however, did not please the laggard; it hurt his pride. So that at the fourth halt of this kind he called out, "You'd better go on; I don't want you to stop for me."

They were not in the best of humours, either of them, and he spoke so roughly that Danvers, in a huff, answered, promptly, "All right; I don't want to stop," and went off as fast as he could.

He had got well on in front, when, wondering how it was that Butler was lagging so, he remembered that, as he stopped the last time, his companion seemed going a little lame on one foot. He was not certain about it—and that was not to be wondered at, for Butler had pulled himself together at once, determined that his rival should not see him discomfited. But Danvers was not quite easy in his mind. If there was anything the matter with Butler's foot, rival or no rival, he must not be left.

He stopped and listened. He could hear nothing of Butler. That might be accounted for, perhaps, by the snow deadening the sound of his footfall. Still, Danvers judged it best to see if all was right or not. It was fortunate that he did. Some little way back he came upon Butler, sitting down on the bank at the side of the road, adjusting the shoe on his left foot.

"What's the matter?" called out Danvers.

Butler had not heard him approach, and, at the sound of his voice, quickly finished with the shoe and sprang to his feet.

"Oh, nothing much!" he said.

Danvers knew the other was not the sort of fellow to stop unless something was wrong, so he asked if anything was the matter with the foot.

Pressed like this, Butler could not deny the fact altogether. Therefore, in as off-handed a manner as he could, he said, "Yes; a little sprain, or something."

It might have been only a "little sprain, or something," but he was suffering much pain from it.

For all that, he continued, "Don't you wait; I shall get on very well."

Danvers did not quite know what to

do. Butler evidently did not appreciate the offer of help implied by his returning, and had intimated that nothing much was the matter. But he would not have confessed to so much as this, Danvers knew, if he was not in a bit of a strait. Reflecting thus, he said,

"I'll walk for a little, I think. I've had a good spell of running."

Now, if Danvers had departed, Butler's pride would perhaps have borne him up, and he would have limped on unseen, congratulating himself that he had not shown he was at all wanting help. How far, though, that feeling would have sustained him was very problematical, and there was, after all, comfort in the thought of his comrade's presence, for he was in reality uncertain if he could get along without help after a time.

Moreover, Danvers's intention of standing by him had been so delicately expressed. There was in it no attempt at hinting any superiority of endurance, nothing about offering help even, although Butler knew perfectly well that to give this, if necessary, was his rival's only reason for walking, and that he had purposely abstained from offering it out of a kind consideration of his own feelings. As he realised the full extent of this forbearance and generosity, he felt ashamed of the harsh reception he had accorded his companion, and after they had gone a few steps side by side in silence, he blurted out, in an unsteady sort of voice,

"Thank you, Danvers."

There was not much in those three words, perhaps, but, somehow, when they were uttered a lump seemed suddenly to come up in the throat of each of them, and a moisture dimmed their eyes for a moment in a fashion that was not at all unmanly. While, if there had been light enough to have made out Danvers's face, you would have seen that it flushed with a deep colour as Butler spoke. This was all that passed, but with it a great revulsion of feeling swept over them, so that when, as they plodded on in the snow and darkness, Danvers said presently, "Hadn't you better take my arm for a bit? It might help you, perhaps," Butler gladly profited by the support offered him.

And, what with that and the aid of a faggot-stick picked up from the roadside, his progress, if laboured still, was far easier to him.

Though they halted now and then to

shake off the snowflakes, these soon collected again. They found, too, that the cricketing-shoes which they wore, however good they had been for running, were not the best footgear in which to tramp along in the snow. It was intensely cold, and Danvers seemed more susceptible to it than Butler. More than once a chill shiver ran involuntarily through his frame, and the other could not help noticing the fact.

"I say, it's too bad of me, Danvers, making you go at this snail's pace. You'll catch a horrible cold."

But Danvers laughingly replied,

"Oh, no, I shan't. And, even if I do, all the better. I shall have two or three days' coddling-up in bed, with plenty of good things to eat and drink and nothing to do."

As soon as the words had left his lips he wished he had answered otherwise. For at once it flashed across him that any enforced absence from work would entail loss of marks and diminish his chance for the medal. Butler, he knew, would scorn to avail himself of such an advantage and would be pained at the thought of it. To dismiss the subject, he tried to start a cheery conversation about what the other fellows were doing, whether they had caught the hare, and so on. It was difficult, however, to keep this up amid all the discomfort of that walk, and after a while only a word or two passed.

What a relief to them as thus they toiled painfully on was afforded by the approach of a cart, whose driver, a carrier, willingly complied with their request for a lift! What a luxury it was to settle down among all the boxes and parcels, protected in a great measure from the wind and snow by the tilt and front-board of the van!

And arriving, after an hour's jogging, at the carrier's home, what a cheerful glow was revealed when the door was opened by the buxom dame, his wife! It was impossible for them to resist the invitation to alight and have a warm by the old-fashioned fireplace; and it would have been churlish, as well as a great effort of self-denial, to have refused to partake of the meal which was already on the table, and in which they were pressed in a respectful but very hearty way to share. But they did not stop long. The Doctor, they knew, would be alarmed at their protracted absence, and the school was more than a mile off yet. So, availing themselves of some of the carrier's coats to put on over their jerseys, our friends, after warmly thanking the good couple, started.

Butler's foot was painful, but he managed to get along somehow, and they battled manfully on together through the snow back to Malton House. Very glad they were to reach the school at last, and very welcome was the aspect of the lamp-lit hall as the porter answered their summons at the door.

CHAPTER IV.

I NEED scarcely tell you that the Doctor was very glad to see the missing hounds again, and that the other fellows sought eagerly to obtain full details of their adventures.

This thirst for information was but scantily supplied that night. The wanderers were very tired and glad to retire to rest as soon as possible. Butler's foot

was dressed with some wonderful lotion of the housekeeper's manufacture, and though much swollen in the morning, it was far less painful. A few days' rest sufficed to cure it altogether, and Butler was in consequence not much the worse for the events of that day.

Danvers, however, was not let off so easily. He was not troubled with much of a cold, but awoke next morning with pains and aches in all his limbs. These grew worse, sleep was out of the question, and when visited by Dr. Marsh, the usual medical attendant of the pupils at Malton House, he was pronounced to be suffering from an attack of rheumatic fever. After several days of constant pain, during which he was often delirious, the crisis of the fever passed at last, and, weak and suffering though he was, the doctor declared him out of danger.

Butler through this anxious time had been tormenting himself ceaselessly with self-reproach. If Danvers had not, like a good fellow, stopped to help him crawl along, he would have caught no chill and suffered no ill consequences. He had been to the sick-room frequently, only to be turned back with "He must not be disturbed now, Master Butler," from the nurse. And on one occasion, when he was admitted after hard pleading, Danvers did not know him, but rambled on in an incoherent manner, so that Butler went away more distressed than ever.

Tilting had now no interest for him; he did not even bestow proper attention on his work, so that all the boys came to notice it and made fresh speculations as to the result of the competition for the medal, the final stage of which was imminent. Danvers was out of it, of course, and Butler too, if he did not set to work in earnest. Hurst and Monecy were known to be well up in marks; both of them were working hard, and the examination was close at hand. Butler, apparently, was indifferent about this affair, but his delight on hearing the invalid pronounced out of danger, and needing only careful nursing to ensure his recovery to health, was great. Joyfully he made his way up to the patient's room, and the half-hour the boys spent together was a very happy one. Butler was often up there after that, talking or reading to the invalid, and one evening found him out of bed and propped up in a big armchair before the fire. That day had been the first of the examination, and a fruitful topic of conversation was thus afforded them. When it had been pretty fully discussed, they delved into their book. Too weak to read himself, Danvers looked forward to his friend's visits, for Butler was a good reader. But to-night he interrupted him after a few minutes.

"I say, Butler," he said, "it's too bad of me keeping you here to-night. You want to look up to-morrow's exam. subjects."

Butler protested that he did not want to bother about it; he should not have much chance, he said.

Danvers did not understand this. He did not know how affairs had been going, and when, on pressing for an explanation, he heard of Monecy's improved position, did not understand how that had come about either. Allowing even for this, though, Butler could, he was sure, beat Monecy in the examination if he only utilised his leisure as others doubtless were doing. So he insisted on Butler

forthwith setting to work. He drew so glowing a picture of the success certain to ensue that Butler's enthusiasm was kindled, and for a moment he thought of leaving Danvers and following his advice. But they had just arrived at a very critical point in the book. The invalid was, he knew, eager to hear the context, and as he looked on his former rival's wan face, and thought how lonely it would be for him if he went, he at once dismissed the idea of going.

"I don't care about the medal, old chap, let's get on with the book," he said. Danvers began to protest, but Butler added, quickly, "It will be all right. I shall get up quite early in the morning and have a go at my books; and now, if you don't shut up, I'll punch your head!"

They settled it that way, with a laugh. Butler was up early next morning, and throughout the week, and profited by it.

There was much excitement that year about the medal, as Monecy and Butler were known to be so close together. All depended now on the examination, and Danvers was one of the most eager to learn the result. When the breaking-up day arrived, he begged to be allowed to witness the prize distribution, but the doctor judged it inexpedient for him as yet to leave his room. So he sat up there alone during the ceremony, having made Butler promise to come up directly it was over. He could hear all the bustle incidental to the important occasion—the arrival of visitors and parents, the trooping of the boys into the "assembly-room," as they called it, and the frequent clapping of hands.

At last there came a longer pause, then a tremendous round of cheering. That was for the possessor of the medal!

Five minutes afterwards he heard a footstep on the stairs, and then Butler entered with some half-dozen books under his arm. Though there was a smile on his face, it was not a very bright one, and there was a something in his general expression that was not reassuring.

Danvers looked up eagerly at his friend's entrance.

"Well?" he said.

"No go!" answered Butler, coming to the fireplace and trying to speak unconcernedly. "Monecy got it. He was just twenty marks ahead of me!"

Danvers's face fell. Butler saw that his old rival could not have been more disappointed had he just received the news of his own failure. However, it could not be helped, and it was all over now. So, to dismiss the troublesome subject, they fell to examining the books. They were minor prizes won, some by Danvers, some by his companion.

So, after all, neither of them gained the coveted medal. Who would have thought a few weeks ago that it would have turned out thus?

But, could our friends have had the opportunity of cancelling the events of those past few weeks, they would not, I am sure, have done so. The medal was a distinction to be proud of, but each felt that in the losing of it he had gained something far more worth having.

Of greater value than any number of medals was the insight each had gained into the character of the other, revealing the existence of good qualities therein of which neither had hitherto been aware, and which laid the foundation between them of a firm and lasting friendship.

(THE END.)

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE ROYAL CHARTER.

DURING a recent visit to North Wales we found ourselves at Beaumaris, and on a bright summer's morning we walked out to Penmon. After a look at the curious old

mens of the well-weathered carboniferous corals that thereabouts crop out from the hillside, we struck northwards along Red-wharf Bay to Llanalgo, and stood above the

our recollection. It swept over the country dealing death and destruction along its path. On the Welsh coast it seems, however, to have been truly terrific, and many

A Terrible Moment.

priory—half dwelling-house, half church—and an investigation of the huge stone dovecot with its hundreds of nests, we strolled on across the rabbit warren to the edge of the cliff, and looked down on the lighthouse. Then after collecting about a dozen speci-

little sandy cove with its scattered rocky teeth a mile south of Moelfra, where five-and-twenty years ago the Royal Charter was wrecked.

The storm on that eventful Tuesday night—the 25th of October, 1859—was the fiercest in

are the stories told of its fury. One of the most pathetic incidents we heard was that of the two little fellows, aged respectively nine and eleven, who came ashore at Conway, and whose father, finding his ship going down six miles out at sea, had lashed them to a plank

and launched them out to the mercy of the waves.

Many were the wrecks, but all sink into insignificance beside that of the Australian steamer. Of contemporary accounts of it there are many. Perhaps the most graphic is that of Charles Dickens. "A man," he says, "living on the nearest hilltop overlooking the sea being blown out of bed at about daybreak by the wind that had begun to strip his roof off, and getting upon a ladder with his nearest neighbour to construct some temporary device for keeping his house over his head, saw from the ladder's elevation as he looked down by chance towards the shore some dark troubled object close in with the land. And he and the other descending to the beach and finding the sea mercilessly beating over a great broken ship, clambered up the stony ways, like staircases without stairs, on which the wild village of Llanalgo hangs, in little clusters, as fruit hangs on boughs, and gave the alarm.

"And so, over the hill slopes, and past the waterfall, and down the gullies where the land drains off into the ocean, the scattered quarrymen and fishermen inhabiting that part of Wales came running to the dismal sight—their clergyman among them. And as they stood in the leaden morning, stricken with pity, leaning hard against the wind, their breath and vision often failing as the

sleet and spray rushed at them from the ever-forming and dissolving mountains of sea, and as the wool which was a part of the vessel's cargo blew in with the salt foam and remained upon the land when the foam melted, they saw the ship's lifeboat put off from one of the heaps of wreck. And first there were three men in her; and in a moment she capsize and then there were but two; and again she was struck by a vast mass of water, and there was but one; and again she was thrown bottom upward, and that one, with his arm stuck through the broken planks, and waving as if for the help that could never reach him, went down into the deep."

The Royal Charter was a full-rigged ship with auxiliary screw. She was built at Sandicroft, on the Dee, and belonged to Gibb, Bright, and Co., of Liverpool. She left Melbourne on the 26th August, 1859, with three hundred and thirty-eight passengers, and one hundred and twelve officers and men; and she had a light cargo of wool and hides and from £500,000 to £800,000 in gold.

Beyond a narrow shave from an iceberg in coming round the Horn all went well, and on the 24th of October she touched at Queens-town and landed thirteen of her passengers. She then stood off for Liverpool, and the next morning picked up eleven riggers to take on to the Mersey, thus making the people on board four hundred and forty-eight.

Slowly she made her way up to Holyhead in the increasing gale, with all her spars

aloft and even the skysail yards across. At a quarter to nine on the Tuesday night she was abreast of the Skerries, and about a mile and a half away from the shore. After passing Holyhead Captain Taylor began to signal for a pilot, keeping close in so as to more readily meet with one, and sending rocket after rocket aloft in request.

At half-past ten all hands were called to put the ship about, and sail was set to keep her off. The effort was, however, in vain, and she began to drift to leeward. So fierce was the wind that the screw was overpowered, and not a foot did the vessel gain. The night was very dark, and Port Lynas light could be just seen but not reached, as slowly the great ship drifted to her doom.

The port anchor was let go, and seventy-five fathoms of chain run out. The screw was going full speed, and yet the anchor dragged. The starboard anchor was let go,

Then it was resolved to get a line to the shore. The question was who would take it.

Rodgers, one of the sailors, asked the boatswain's mate what he was going to.

"Go ashore, and you go too!"

Both men went to find a line. Rodgers found one in the fore-castle, and hurried forward. As he was fastening it round his waist the chief officer, Mr. Stephens, told him to take a lifebuoy with him, but he refused, and, going along the bowsprit, dropped into the sea from the flying jibboom. Meanwhile the boatswain's mate had found another line, and was being lowered amidships when there came a shout that a man had gone off from the bow.

Three times was Rodgers washed back to the ship, and at last, bruised and exhausted, he was seized by the Welshmen, who had come down to the beach.

"Give us the line!" they said, as soon as he touched the ground, and they pulled him up out of danger and away while they hauled a hawser ashore and fastened it to a projecting rock. To the hawser a boatswain's chair was attached. It had hardly come into use before the end slipped loose as with a tremendous crash the vessel broke in half amidships.

A child was washed out of her mother's arms, and was being dashed about the deck, when the captain shouted to the mate to give a hand and lash it to something with a rope, and this

was done without a moment's delay.

One of the apprentices, Hughes, was standing in the waist when the vessel parted under his feet, and with the wrenching iron-work he fell into the water. He was struck and battered about and the skin was torn off his hands and face, and yet he came to land.

One of the passengers was on the deck with his wife and two children. He clutched them as the sea broke over, but it washed them out of his hands and swept him off. They were drowned and he was thrown safely ashore.

But the end was near. With another huge heave of the sea the hull split again across the forehatch, and all forward were dashed into the water.

Not a superior officer was saved, nor a woman, nor a child. The captain met a sailor's fate. He was seen on deck from nine o'clock exerting himself to the uttermost. Time after time was he knocked down by wave and spar, and saved himself only by seizing a rope. He was on deck giving orders to the last with a spar lashed to him so that he might be prepared to float. He was again seen struggling in the water clutching at a yardarm which every now and then was washed from his grip. Twice during this struggle did he shout, "There is hope yet!" and although in his heart he may not have thought so, yet the cry did much to encourage those around him. Soon he and Mr. Cowie, the second officer, were seen on the lee-side of the ship trying to reach the beach,

A Pleasant Day.—See p. 334

and the addition proved useless. The stream anchor was being got up from the after orlop deck when the starboard cable parted. And faster the ship neared the shore.

The mainmast was cut away to relieve her and trust to steam alone. Then the foremast was cut away, and the mizen broke off short as the ship struck. Orders were given to drive her hard on to the bank, but the wreckage fouled the screw, and she was left at the mercy of the waves which every instant broke over her.

There is no need to dwell on the scene of terror as the vessel lifted and fell with a crash at every heave of the angry sea. At first the passengers did not recognise their danger, but it soon became only too apparent. In the saloon the Rev. Mr. Hodge, of East Retford, attempted to hold a service and read portions of the prayer-book, while the women and children clustered round; but the fearful beating of the ship rendered the effort vain. The passengers were told they were aground on a sandy beach, and would be left high and dry when the tide went out. And so they hoped—but it was not to be.

The wreckage was cleared off the boats, and all but one were stove in, and nothing was done during the night to save the lives of those on board, it being thought that the ship was safe. When the day dawned the land appeared about thirty yards away.

The wind and sea were still terrific. The captain gave the order to clear away the port lifeboat. It went down as we have seen.

and then a boat fell from the davits and struck them both on the head to rise no more.

Of the four hundred and forty-eight on board only thirty-nine lived to tell the story of the wreck. The ship speedily broke up, and the northern coast of Anglesey was strewn with her fragments and cargo. Of the gold over £300,000 was recovered by the divers in the salvage operations which were conducted for some time afterwards.

The effect of the sea upon the great iron safe in which the treasure was contained, and even upon the iron boxes into which it was subdivided, was extraordinary, and of itself sufficient to show the power of the gale. Not only was the bullion safe totally broken up and destroyed, but the iron boxes were crushed and torn, and their valuable contents dispersed, and sovereigns and lumps of gold were forced into the very substance of the

iron. The fragments became the nucleus of a gold formation richer than the richest auriferous bed, and the sands around richer in gold-dust and bullion than the richest washings of Australia. Sovereigns drifted in with the sand and lay scattered like shells on the beach. One ingot of gold had penetrated the ship's ironwork like a shot from a gun, and loose sovereigns were driven in as if the iron had been melted around them.

MODEL YACHTING IN 1884 AND 1885.

THE model yachting season of 1885 promises to be even busier than its predecessor. The new London begins its sailing matches at Kensington; the new club at Liverpool starts on Newsham Park; and the other newcomers at Grimsby, Manchester, Ryde, the Hartlepoons, and Itchen Ferry, have announced themselves as under way.

And the measurements are to be as varied as, or rather more varied than, ever. We are still to have the *Serpentine*, the *Albert*, and the Liverpool working on the Yacht Racing Association scheme of beam and waterline squared multiplied by beam and divided by 1,730; while the other tonnage clubs, the *Greenock* and *Glasgow*, cling to the older rule of waterline less breadth multiplied by breadth and half-breadth and divided by 94. Ryde and Belfast will still take their length from stem-head to stern-post on deck; while the Hartlepoons will take it from stem-head to stern-post on waterline; Clapham will take its length over all; Kingston and Victoria will take their length over all and along the waterline; and, lastly, the London will sail under their new 240 rule, designed for giving a chance to every type of boat not exceeding certain dimensions.

This new rule, which has evoked considerable interest among model yachtsmen as being a promising attempt to solve a very obvious difficulty, is as follows:—"The length on the load waterline, not including the post of any permanent rudder, shall be multiplied by the greatest beam, wherever found, and the product of these measurements shall not exceed 240; and no boat exceeding forty inches in length on the load waterline shall be eligible. If any part of the immersed portion of the hull of the boat should project beyond a perpendicular drawn from either end of the load waterline, it shall be added to the length taken for the purposes of this measurement; and no part of any permanent rudder shall be allowed to project abaft of such perpendicular more than half an inch. In measuring the beam no allowance will be made for wales, doubling planks, or mouldings of any kind. Channels, if used, shall not exceed three-quarters of an inch in width on either side of the boat, nor be more than three inches in length, and must be of such a shape as the committee may approve. Every other dimension of the model will be at the discretion of the owner."

So runs the latest edict in model yacht measurement. The members of the club for whose use it was formulated have taken advantage of the latitude allowed, and in the new boats "built to fit" have gone in for long counters and raking stems, giving a length over all of about 42 and a waterline of 34. This is the starting type. Whether it will be beaten by a narrower or broader one remains to be seen.

The meaning of these figures when compared with tonnage models on the present Y.R.A. scale, taking an inch to a foot, is very well brought out in the scheme recently issued by the *Serpentine* Club. A model ten-tonner on that club's system may be 30.7 by 10.3, 33.2 by 9.5, 35.6 by 8.8, 37.3 by 8.3, 39.3 by 7.8, 41.0 by 7.4, or 42.6 by 7.0, the latter being the "six beams" beyond which a wise builder for all-round sailing will not go. A

model fifteen-tonner may be 34.7 by 11.7, 38.0 by 10.9, 40.5 by 10.1, 42.7 by 9.5, 44.7 by 9, 46.3 by 8.5, or 48.6 by 8.1. These represent measurements taken on the waterline, not the length over all, which may be a very different thing, owing to the bow and counter.

The waterline is taken as a convenient factor only. It is confessedly but a delusive measurement of a yacht's power; for the instant the wind strikes the sails the bow and counter dip in to leeward, and the waterline is increased in length in proportion to the angle of heel. The best 240 boat will obviously be that which secures the greatest increase to her waterline in the shortest possible time.

It is a pity that the 240—which seems to have been arrived at as approximating to the dimensions of the first-class boats hitherto sailed on the Round Pond, or as being the number of pence in a pound—was chosen instead of 200 or 300. On yacht racing scale, at an inch to a foot, a 240 boat comes out as a seven tonner, whereas 200 or 300 would have given a standard size—five tonners or ten tonners, and thus have brought the London more in harmony with the tonnage clubs.

The problem of measurement was attacked during 1884 from another standpoint. In October a Model Yacht Regatta took place at West Cowes, in which Admiral De Horsey of the Channel Fleet acted as umpire. The system then adopted for classifying the boats was merely one of weight. The boats were put in the scales, and yachts of thirty pounds and over, yachts of fifteen pounds and over, yachts of five pounds and over, and yachts of three pounds and over, formed the classes. Arrow, a 53-pounder (we beg pardon, tonner), won in the first class; Snail, a 23-pounder, won in the second; Elk, a 13-pounder, won in the third; and Dot, a very narrow 3-pounder, won in the fourth. The winners were all cutters, but one of the curiosities of the day was that of a schooner, Tide, beating the cutters to windward.

At the regatta of the Liverpool Club on the 25th of August, held on Hollingworth Lake, near Todmorden, at which clubs from all the three kingdoms were represented, the measurement was on the 1730 rule, and in the all-comers race boats 54 inches on the waterline were, irrespective of beam, admitted as 30-tonners. *Galatea* and *Thought*, both built to tonnage measurement, occupied first and second places, but one of the Kingston boats, the *Comet*, 50 inches on the waterline, ran into the third, somewhat to the astonishment of the spectators.

On the same occasion a race took place for model steamers. It was won by the *Greyhound*, a six-foot boat. The same boat took part in the steamer races held by the Liverpool Club on Sefton Lake during May, when there were eleven entries, ranging from a twin screw thirty inches on the waterline working at a pressure of ten pounds, up to a powerful boat 78 inches on the waterline, whose engine was driven at a pressure of a hundred. The winner turned up in *Vampire*, a five-foot boat; *Snark*, the monster, being second; and *Greyhound*, whose propeller fouled some weed, being third.

Considerable attention was directed to the

Liverpool Club during the year owing to the publication in the "Field" of the 9th of February of the working drawings and dimensions of the commodore's 10-tonner *Ethel*. As a further guide to the way in which tonnage measurements work out on the inch scale we give the chief figures of this very taking model. Length over all, 50.50; waterline, 43.0 (the *Ethel* has a raking forefoot and a 5-inch counter); beam, 7.25; lowest freeboard, 2.75; extreme draught, 8; mean draught, 6.87; displacement, 27lb., which is equal to 21 tons; weight of lead keel, 17lb., which is equivalent to 13 tons; inside ballast, 2.5lb.; weight of hull, spars, etc., 8lb.; area of mainsail, 942 sq. in.; of foresail, 221 sq. in.; of first jib, 242 sq. in. The *Ethel*, it will be seen, is a very narrow boat, but the dimensions will be welcomed by such of our readers as are anxious to produce satisfactory models of the "real yacht" type.

As a contrast to the *Ethel* there was published on the 30th of September in the same paper—the leading yachting journal of the world—a wonderful design from South Yarra, showing what our Australian colonists understand by a model yacht. It had a curious arrangement of fins and centreboards, and, whatever it might do on Australian waters, would simply be sailed round on our ponds by boats of the *Ethel* and other types.

The *Ethel* herself was on view at the *Albert* Club Exhibition at Hull in April, though there she took second prize to Mr. Donaldson's 40-tonner *Tara*. This exhibition was a very fine one, and included, amongst other splendid models, the steam fishing cutter of Mr. Toozes, and the North Sea trawler by Mr. Hodgson, both members of the Hull Model Yacht Clubs, and both winners of gold medals at the South Kensington Fisheries Exhibition for the ships they showed.

During the year a series of inter-club matches was sailed between the *Albert* and the *Kingston*, resulting in favour of *Kingston* on each occasion. Like the *Albert*, the *Kingston* held an exhibition of models. It took place earlier in the year, and comprised between forty and fifty yachts all made by members of the club. The proportion of built boats to carved ones was about three to one—a fact easily accounted for by the large size of the boats, the classes ranging up to fifty-four inches on the waterline, and the favourites being the forty-twins.

Model yachting seems to have taken firm hold of the good folks of Hull. Among the noteworthy events of the season, certainly not the least was the birth at the Yorkshire seaport of "the organ of the sport," the "Model Yachtsman," an excellent publication recording with accuracy and enthusiasm the doings of the graceful craft whose beauties its primitive frontispiece so cruelly belies.

North of the Tweed the programmes for last year were full and varied. The *Greenock*, which this year has an exhibition at the Western Hall in March, held their annual regatta on the Gryffe Reservoir on July 5. The winners in the several classes were *Rival*, *Flora*, *Flower of the Forest*, *Gawary*, and *Ell*, while *Fairy Queen* won the Consolation Race. At the annual meeting on the 24th

of October the chief prize-winners of the year turned out to be Vision, a 40; Will o' the Wisp, a 51; Royal Sovereign, an 83; Rival, a 20; Lizzie, a 20; and Flower of the Forest, a 68.

In the Glasgow Club the chief winners of the year were Queen of the Clyde, Pomona, Thistle, Madge, and Gleam. The race for the prizes given by Mr. Campbell, of Tullichewan, took place on Loch Lomond on the 20th of September. The starters were Chieftain, a 60-tonner on Y.R.A. measurement, inch to a foot; Gleam, a 41; Mary, a 20; May Bell, a 46; Midge, a 43; Siren, a 42; Stygee, a 54; Swallow, a 38; and Volant, a 48. They started from Balloch Pier, rounded the beacon, and ran to the Keeper's Lodge on Inchmurrin, nearly four miles away. The same course was sailed on the return, making it a dead heat to the beacon and a reach to Balloch. A course of this length and character ought to have been a very fair test of the merits of the boats. Gleam proved the winner both out and home, and so carried off the cup.

The regatta of the Belfast Club took place at the Twin Islands on July 12th, the race for Mr. Harland's cup being won by the lugger Lulu, which did the mile and a quarter in exactly twenty minutes. The wind, however, was fresh, and dead abeam, so that the lugger had every chance. The Belfast Club seems to have prospered much since it was started by Messrs. Hill and Gafikin at Easter, 1882; and quite a cloud of boats, to judge by the reports, take part in its races. The acquisition of the right to sail in Clear Water Basin at the local waterworks has done a great deal towards this success. The chief races of the year were won by Lulu, Flirt, Benroe, Waterwitch, Madge, Egeria, Will, Meg, Primrose, Snowbird, Latonia, Foam, and Spray. One of the Belfast boats, the lugger Liz, took part in the Hollingworth Regatta.

(To be continued.)

OUR NOTE BOOK.

"VAR DA VAIGHER."

REV. W. P. GOUDIE, B.A., writes from Derby: "Will you allow a 'Lichen from the Old Rock,' who passed the first twenty years or more of his life in the Shetland Isles, to make a little clearer for our boys the title of Mrs Saxby's poem which occurs in your Christmas number?"

"The words 'Var da Vaigher' are not foreign words, as might seem at first sight. 'Var' (better spelt *war*, I think) is from our own Anglo-Saxon verb *werian*, to defend, the Anglo-Saxon substantive from the same being *werend*, a defender. Connected with the same root are the Anglo-Saxon words *warian*, to guard, *waru*, a defence; *waer* (pronounced *war*), wary; *weard* (pronounced *ward*), a guardian, guardianship. *Da* is only a softening of the Anglo-Saxon thorn *þ* in the word *þa* or *pe*, our present article. *Vaigher* is only the word *voyager*, an *a* having taken the place of *o*, an *a* for the modern *o* being a very common mark of the northern English dialect. The word *vaidge* for voyage is still very commonly used in those northern islands.

"As one who has spent many happy hours with the 'yule bau,' I would say I always saw the players have goals, though the rules might be few and not those of Rugby."

MR. GLADSTONE'S LATIN VERSION OF THE HYMN "ROCK OF AGES."

The well-known and beautiful hymn "Rock of Ages," by the Rev. Augustus Toplady, has many interesting facts and anecdotes associated with it. Every English and Ameri-

can hymn-book includes it, and it has been translated into almost every modern language.

Many years ago an American traveller, Dr. Pomeroy, was in an Armenian church at Constantinople. He was much struck by the singing, although he could not understand the words. Many of the people were deeply moved, and he noticed some of them in tears. He asked one of the missionaries what the hymn was, and was told it was "Rock of Ages," then recently translated.

Dr. Moffat, in his *African Recollections*, speaking of the hymns in the Sechuana language, the dialect used by all the Bechuana tribes, describes his failure, after repeated attempts, to translate this hymn. At last he succeeded, although not to his own satisfaction. What followed we give in his own words. "I did what I could, and manufactured a translation. 'It is good,' said one. 'Oh, it is very fine,' said another, while I was pitying their sad want of taste. From some circumstance, which never could be explained, it disappeared either in my study or printing-office. I was not sorry, except for the hours I lost in seeking it. It was in vain to ask me to reproduce it. My plea was want of time.

"During one of my sleepless nights, and there were many, while musing over various subjects, 'Rock of Ages' passed vividly through my mind, and I felt no difficulty whatever in repeating the first verse in the native language, just as I desired it to be. It was not long before I had concluded the whole hymn. It was soon printed, with three more hymns, to make four pages of the size of the hymn-book. A copy was given to the members of the church, that the hymn might be tried in public worship.

"It got abroad that a new hymn had been added, with the name 'Rock of Ages.' Persons came from all quarters—from distances of ten to more than twenty miles—with books in hand, to have 'Rock of Ages' inserted. An elderly man, chief of his village, came with a score of hymn-books, some old, torn, and patched, belonging to his people. To the question 'What do you want?' the answer anon was 'The Rock of Ages!' and of course the leaves were inserted in the old books, and away they went well pleased."

Deeply interesting it is to find the poor African converts delighting in the same hymn which brought consolation to the lamented Prince Consort on his deathbed!

But it is time to give the translation into Latin, made by Mr. Gladstone in 1848, and published in a work rarely met with. The lines are now reproduced by special permission:—

Jesus, pro me perforatus,
Condar intra Tuum latus,
Tu, per lympham profluentem,
Tu, per sanguinem tepentem,
In peccata mi redunda,
Tolle culpam, sordes munda.

Coram Te, nec justus forem
Quamvis tota vi laborem;
Nec si fide numquam cesso,
Fletu stillans indefesso:
Tibi soli tantum munus,
Salva Tu, Salvator unus.

Nil in manu mecum fero,
Sed me versus crucem gero;
Vestimenta nudus oro,
Opem debilis imploro;
Fontem Christi quero immundus,
Nisi laves, moribundus.

Dum hos artus Vita regit,
Quando nox sepulchro tegit,

Mortuos cum stare jubes,
Sedens Judex inter nubes,
Jesus, pro me perforatus,
Condar intra Tuum latus.

MR. DARWIN IN TIERRA DEL FUEGO.

Charles Darwin was in early life, from 1831 to 1836, attached as naturalist to the surveying and exploring expedition of H.M.S. Beagle, under Captain Fitzroy, R.N. He told the story of his adventures and experiences in a volume entitled, "Journal of Researches," now familiarly known as "A Naturalist's Tour round the World."

When the Beagle reached Tierra del Fuego, the desolate region at the extremity of South America, Mr. Darwin saw what he describes as "the most curious and interesting spectacle" he ever beheld, in the aspect of the natives who came down to the shore to gaze at the ship. "I could not have believed," he says, "how wide was the difference between savage and civilised man; it is greater than between a wild and domesticated animal, inasmuch as in man there is greater power of improvement;" adding that "one can hardly make oneself believe that they are fellow-creatures and inhabitants of the same world." He gives an interesting account of what seemed to Europeans their unutterably wretched life; but comes to the conclusion that, as there is no reason to believe they decrease in number, "we must suppose they enjoy a sufficient share of happiness to make life worth having." Their language seemed scarcely articulate; in winter, when pressed by hunger, they killed and devoured their aged women before they killed their dogs which were useful in hunting; they were almost like the wild beasts in their apparent incapacity to reason on some simple subjects.

Many years afterwards Christian missionaries found their way to Tierra del Fuego, and as the result of long and laborious effort established a church among the Fuegians, with schools and all the appliances of civilisation. The wild and wandering people were induced to build and occupy cottages, to cultivate their gardens, to rear cattle, and follow the various occupations of civilised life. Their language was reduced to form, and in due time parts of the Scriptures were translated into their barbarous tongue. English voyagers were astonished to witness the altered condition of the people, once heathen cannibals and now engaged in peaceful industry and commerce.

When Mr. Darwin heard what had taken place he wrote to Admiral Sullivan, who had been his shipmate in the Beagle, expressing his surprise and satisfaction. "I had always," he wrote, "thought that the civilisation of the Japanese was the most wonderful thing in history, but I am now convinced that what the missionaries have done in Tierra del Fuego is at least as wonderful." Not content with expressing his admiration in words, he gave proof of it by sending a donation to the South American Missionary Society, by whose agents the work had been accomplished.

Among the many tributes to the memory of the great naturalist, called forth at the time of his death, none was more touching than the reference to Mr. Darwin in the annual Report of that Society. It paid "a sincere tribute of respect to the memory of a man of unblemished character, of the highest intellectual capacity, and of rare attainments." The incident is honourable to Mr. Darwin and to all concerned in the civilisation of Tierra del Fuego.

"Do right. And thou hast nought to fear;
Right hath a power that makes thee strong;
The night is dark, but light is near;
The grief is short, the joy is long."

CORRESPONDENCE

E. T. S.—1. The Pyx is a box in which coins are deposited. At first the name was used only for the vessel containing the sacred elements; then it came to mean, in addition, a box for pious offerings; and now it has the meaning we have given. The Trial of the Pyx is a ceremony which takes place every year, in which the weight and purity of the gold and silver coins issued by the Mint are tested. A few specimens from each day's mintage are put into the box, and a jury of goldsmiths is summoned to Goldsmiths' Hall to assay them. There proper furnaces, balances, etc., are provided, and the testing takes some hours. The Pyx of 1884 contained 1,816 sovereigns, 700 half-sovereigns, and £420 10s. of silver. A few of the coins were selected, melted down into ingots, and these ingots compared with the standard trial-plates kept in the custody of the Board of Trade. This is the test for fineness; for weight ordinary delicate scales are used. The verdict is always satisfactory, and the trial is always concluded in time for a sumptuous banquet. 2. The 1883 coinage of gold was a small one only—£1,763,197: the coinage of silver was the largest since the introduction of the present series—£1,272,025. The number of coins struck during the year being 36,442,214, or, say, one per head of the population.

HENRY KIRABY.—If this should meet the eye of H. K., we are desired to entreat him to write at once to his mother. We are authorised to say that "he may stay where he may have settled if he wishes to do so, but on no account should he neglect to write immediately." The boy who, after such an invitation especially, should neglect at once to comply, is hardly the lad we should like to feel was numbered amongst our readers.

WALTER.—1. It was distemper your dog had. You must be careful now with the feeding. Feed only twice a day. Give a fair allowance of meat, but no oatmeal, and not much green food if there be a tendency to diarrhoea. 2. We will soon have an article on training dogs. We cannot write one through the correspondence columns. Treat him kindly; rule by love and firmness; never lose your temper. Speak slowly to him. These are golden rules in dog-training.

WAVERLEY.—1. Only experienced men are on the staff of the BOY'S OWN PAPER. 2. The remedy for the rabbits' ears is cleanliness and good food. Do you really attend to them as well as you ought. Wash the sores, and anoint with carbolic oil.

C. A. HAYTER.—You ought to have placed your eggs as soon as laid in bran, the small end up, and covered them over. You kept shifting yours about too much. Let them be as new-laid as possible. Not over ten days, say.

W. A. D.—There are several books on the Thames. Apply for list to Stanford, Charing Cross, or others. We have had two series of articles on the subject—one describing it from Oxford to Richmond, the other tracing it from Oxford to its source. You would find Dickens's "Dictionary of the Thames," published at a shilling by Macmillan and Co., full of information.

C. R.—Baa! Where can you get a piece of "ewe" tree? If you mean yew, you can usually obtain it cheap from a good mahogany merchant, but whether there is one in your neighbourhood we cannot say. Try Mr. R. T. Perry, 8, Penton Street, Pentonville.

RUPERT.—The ages for outdoor officers of customs are from 19 to 25, and candidates must be 5ft. 4in. in height, and 34in. round the chest; or if 5ft. 10in. in height, then 35in. round the chest. The examination is in handwriting, orthography, arithmetic, and composition. The salaries rise from £55 to £100, and the officers are eligible on further examination for higher posts, with salaries ranging up to £300. The Civil Service Department of King's College, London, publish a penny paper, "The Civil Service Candidate," which gives the latest information on such matters, but your best course is to apply direct to headquarters.

A GENTLEMAN COMMONER.—Ordinary knighthoods are now given for so many reasons that they are no test of ability or merit. The amount of income necessary varies with the social position of the knight, which is, however, hardly affected by the title. No poor man is made a knight, except by mistake. Of course it is understood that knights bachelors are meant; a knighthood of one of the orders is a different thing altogether.

W. WILLIS.—1. "The King of the English in their old country"? There is no record at present of the existence of a king amongst them until this country was colonised. 2. Ducks and drakes. Perhaps this is it?

"O Nature to Old England then
Continue these mistakes,
Give us for all our Kings such Queens,
And for our Dux such Drakes!"

T. JONES.—The work of the lapidary is a very interesting one. Miniature monuments, pyramids, etc., look very pretty as paper-weights or mantelpiece ornaments. We hope to give an article on the subject in this volume.

D. A. M. SCOTIA.—Take away the millet-seed. Let the bird have plenty of fresh air and a sunshine bath occasionally. Put a little saffron in the water; you cannot do more.

M. F. W.—Yes; begin with avadavats and budgerigars. Gain experience with these before you spend money on more expensive birds.

E. O. R. T. CKERMAN.—Thanks for your letter on foreign birds. Any advice we can give you on this or any kind of bird or beast you are right welcome to.

C. TWITCHAM.—1. Food for thrushes and blackbirds. A paste of ground oats damped with milk and water, shredded raw meat now and then, a few grocer's currants, beetles, snails, caterpillars, earthworms, etc. Plenty of pure, fresh water. 2. Your rabbit has some skin complaint. What we could only say if we saw it. Keep bedding and hutch very clean, dust sulphur into the coat. Give a pinch of Glauber salts in water, and put a little sulphur in the food.

PAKIPKA.—Get a little Sanitas ointment, and use it on the bare part of the thrush's head. Change the food; that crushed hemp-seed that you are giving it is the cause of the complaint. Stop it. See answer to C. TWITCHAM.

A. M.—There are dozens of mixtures in the market that will remove hair, but few of them are harmless, and none of them really permanent. You do not say if the hair is to be removed from your skin or some dead skin, and so we cannot advise. You would find it better to keep your hair on.

S. H.—The Nottingham County captain for 1884 was Alfred Shaw. You can get back numbers of the cricket annuals by applying direct to the publishers.

P. S. STRANKER.—The "Burgees of "Yacht Clubs" was given away with the first O. P. number of the B. O. P. in 1883.

FORTIS IN ARDUIS.—A brig is square-rigged on both masts, a brigantine is square-rigged only on the foremast. See our plate of ships in the second volume.

PUER.—The address of Messrs. Brock, the pyrotechnists, is either Crystal Palace, Nunhead, or Cheap-side, whichever you prefer.

R. A. N. SOPHIE.—See our articles on the Victoria Cross in the part for May, 1882. The cross can only be given for bravery in the face of an enemy.

IGNORAMUS.—There is a depot for the publication of Swedenborgian works in Charlotte Street, Bloomsbury; and an inquiry there might procure you the information you want.

YACHT.—As a general rule a ship over three hundred tons will carry half as much again as her register. A two-thousand-ton ship would thus carry three thousand tons burden.

ENGINEER.—1. The cement under the edges and rivets of copper boilers is made by mixing quicklime with bullocks' blood and using it immediately. 2. To make a cork airtight boil it two or three times in melted paraffin.

A MISSING ONE.—Of the three first volumes the numbers are out of print, but the parts are not. Orders for any parts can be executed.

E. J. W.—As we fully described the University Boat-race of 1884 you can refer back.

A WOULD-BE PURCHASER.—1. When a tricycle is geared for speed the lower wheel on which the chain revolves is larger than that on the axle, and in consequence the driving-wheels have to revolve oftener than the pedals. 2. Mix the blacklead into a paste with milk. 3. Any sewing-machine shop will supply you with a bottle of oil. Always clean your machine with paraffin before you change your lubricant.

W. T.—The training-ships for officers for the merchant service are the Worcester on the Thames and the Conway on the Mersey. For particulars as to mode of admission see back numbers.

A. W. P.—To remove tar from black clothes first soften it with olive-oil, and then dose it with successive applications of turpentine. Naphtha or benzine will answer the same purpose as the turpentine. The secret consists in getting the tar-spot thoroughly soft before you begin; and the best way to prevent the oil confining itself to the tar is to apply it with a plectrum of cotton wool.

CONDOR.—In models the only sails are forelug, jib, and mizen; but in the full-sized luggers you can carry a mizen-staysail and mizen-topsail. Use a lug-mizen for fair weather, a lateen for foul. There is no doubt about it; you must use swing rudders if your boat is to keep her course in all winds. Make them of lead and wood, with the wood nearest the sternpost. You should have two or three of different weights; but you do not require a rudder in a dead thrash to windward.

F. WOOD.—Look at the date of the book. Australia has the third longest navigable river in the Darling. It is navigable for 2,345 miles.

A. H. WALTERS.—Haulan was never beaten on the Thames. You have been misinformed. Glad you made such a success of the "Boy's Own Penny Whistle." Others have done the same.

No. 320.—Vol. VII.

SATURDAY, FEBRUARY 28, 1885.

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XII.—SCHOUVALOVSKY PERYOULOK.

WHEN Kakaroff arrived at the house in the Novoye Derayvnie, in which our old friend Hermann was so curiously housed, he found all proper precautions had been taken to guard against the escape of any of its inmates.

The police were in possession of quite sufficient evidence against Hermann to send him off to Siberia with no loss of time, and without the formalities of a regular court of inquiry. He was marked by the police; his connection with a band of disaffected and dangerous characters had been discovered and winked at by them in the hope of his leading other and more important criminals to detection; but the outrage in Zakolniki, the harbouring of Palitzki, and the mysterious disappearance of Ivan Dobroff, had all been most clearly traced to him by the police, who had immediately connected the departure of Annie with the loss of their clue to the boy, when they heard the story by the two schoolfellows of their missing comrade.

The guard who attended the train on the day of Ivan's departure to Kursk had been found and brought to the doomed house in the Novoye Derayvnie, where he was now waiting in company with a strong body of police.

Kakaroff and the colonel entered the room, which we de-

"Each knew that it was for life."

scribed as being a sort of low vodka-saloon, or drinking-place, and here they found Hermann in charge of a sergeant of gendarmes, whose troopers had been posted at each door leading from the apartment. He looked savagely at bay as he surveyed the overwhelming force in whose hands he found himself.

Foot soldiers of the police corps were posted in the courtyard, the street was patrolled by the mounted troopers of the gendarmes, the inhabitants of the neighbourhood were cowed by the overwhelming force, and scowled malignantly on the soldiers, none knowing whose turn it might be next to have them as visitors.

Kakaroff, with his attendant colonel, strode into the room, and, taking his note-book from his pocket, he addressed Feodor Karlovitch thus:

"Your name is Friederich von Hohenhorst, but you are known as Feodor Karlovitch Hermann. You have connected yourself with a set of desperadoes who defy the law and endanger the welfare of the community. Do you attempt to deny that the names I give you are correct, the one being your real name and the other assumed?"

"I do not deny it; but I deny the right of the police, or any other authorities, to interfere with me in the peaceful exercise of my trade."

"That you were not asked about. The name is correct—not that your admission of the fact matters much."

"Then why do you ask me to admit it?"

Kakaroff took no notice of this question, he only made a tick with a pencil in a note-book, and, turning to the sergeant, said, "To what room does that door lead?"

"It is closed, your excellency; and having no orders to break open anything, but only to prevent the escape of the inmates, Captain Strankevitch has placed sentinels at the windows, back doors, and all points from which escape might be made."

"Send a trooper for him."

In a shorter time than it takes to write, the man was gone and had returned with the officer.

"Why was that door not opened?"

"I had no directions to use force save in preventing escape."

"Bon! But does it require any great amount of force?"

"Yes; it is as firm as the wall of the room."

"Then you were right. Open it now."

The officer gave the necessary order, and a budeschnik, or foot soldier of the police, approached with a crowbar, and in a few moments the massive door was wrenched, not from its fastenings, but actually asunder. The fastenings were found to be two heavy bars of iron, fitted into sockets in the wall, and massive catches or rests screwed into the wood-work of the door, which, on opening inwards, only pressed upon these bars without weakening them. The boards forming the door were literally picked to pieces by the crowbar before entrance could be gained.

When this had been effected Kakaroff was the first to enter, and he was struck at the elegance and refinement of the room thus disclosed, and still more with the quiet dignity and singular beauty of the only occupant—a lady evidently, well but simply dressed, and looking queenlike in her calm and haughty bearing.

We who have seen Annie as the bright and almost childish companion of Ivan might well have failed to recognise her in the noble woman who now confronted Kakaroff.

"How dare you break in upon my privacy in this disgraceful fashion? What charges have you against an unoffending lady?"

"I am sorry to say," answered Kakaroff, "that I cannot answer any questions. I come, unfortunately, to ask some, to which I must beg you to reply. And first, is your name Anastasia von Hohenhorst?"

"That is my name."

"Do you know anything of the student called Palitzki?"

"Nothing."

"Do you know anything of a boy, a pupil of the First Gymnasium, who was brought here some six weeks back, and has never been heard of since?"

There was no answer.

"Bon! we shall see. Captain Strankevitch, will you oblige me by asking whether the guard from the Kursk Railway is in attendance?"

"He has just arrived."

"Chorascho! Then let him be brought here, and bring in the student Abrazoff, of the First Gymnasium, who is waiting without."

On the arrival of the guard Annie turned very pale. She went back to her sofa, sat down, and drank a glass of water, and then seemed ready for action. Abrazoff she just glanced at and no more, as if deeming him unworthy of any special attention. Popoff did not appear, having gone round with a police colonel to the back of the house.

Kakaroff, whose eye took in all these matters at a glance, turned to young Abrazoff, saying,

"Is that the lady in whose company you saw the supposed girl in the uniform of the female Gymnasium, but whose voice recalled your schoolfellow, on the 25th of July?"

"No doubt about it," replied Paul.

"Stefan Gorkoff, conductor on the Moscow and Kursk Railway. Is that the young woman who travelled with her sister on the Kursk line?"

"I could swear to her anywhere."

"How is it you are so certain; you see so many passengers?"

"Yes, but none like her. Poor creature! she was greatly troubled by her mad sister, who struggled and fought, declaring in her madness that she was not a girl but a boy."

"Should you know the mad girl if you saw her?"

"Yes, she had a remarkable face, and was not unlike that young gentleman in the Gymnasium dress," said the conductor, pointing to Paul.

There was a silence of some moments, during which Kakaroff made some rapid entries in his note-book. At last, turning to the colonel, he said, in quiet, stern, official tones,

"Colonel, there is your prisoner. Remember, however, that she is to be treated with courtesy. Is the carriage ready?"

"Ready," was the reply.

"Anastasia von Hohenhorst, I must ask you to do me the favour to dress for a little journey—a mere formality, but one unfortunately demanded by the law. No harm will happen to you; a little inquiry is necessary in which you will

have to assist. I must urge upon you the great necessity that exists for despatch."

Without a word Annie rose and entered a further chamber, whence, after a short space, she reappeared habited in a walking dress. The soldiers made way for her and the colonel, presenting arms as they passed to the close carriage which was to convey them to the palace of the prefect of the Moscow police. They entered and drove off.

Kakaroff noticed that between father and daughter there was no leave-taking. Hermann was sitting dogged and sullen on the wretched sofa in the intermediate room between his vodka-store and the apartments so completely set apart for Annie.

"Colonel Schuleikin," said the general "you are to take charge of the body of Friederich von Hohenhorst, and you will be answerable for its security until you are relieved of your charge by the proper authority in the official manner at headquarters."

"With what am I charged?" asked Hermann.

"With murder, felonious abduction of a pupil of one of the Imperial Gymnasias, and with high treason against the person of our sovereign lord and master the Emperor."

"With whose murder am I charged? I have never shed the blood of any human being."

"You have no right to question me," said Kakaroff, "but I have no objection to reply that the person you are accused of murdering is a student called Palitzki, who was last seen alive in this house."

"Upon such evidence you may accuse me of the murder of my daughter, who was last seen alive in this house. If the other charges are as flimsy as this one there is not much danger for me."

"You are not on your trial, but you may say what you please to me."

"Well, then, I will tell you. Palitzki is here, alive and well. I will lead you to him if you particularly wish it."

"I should wish to see him of all things," replied Kakaroff; "and as one of the charges against you would be removed by the sight of him 'alive and well,' I could, on my own responsibility, erase that part of the denunciation against you."

"You must remove that table."

This was done, when Hermann drew aside a very disgusting-looking mat or carpet, showing that the floor had been cut in that part, forming a trap-door. He seized a ring in the flooring, raised the trap, and showed a break-neck-looking ladder leading into perfect gloom.

"Send some men down with lights," said the German; "you will find it dark down there."

Accordingly candles were lighted, and two gendarmes descended the ladder. They came into a long, dark, vaulted passage with stout wooden partitions, with doors on either side. At the foot of the ladder they waited, at Kakaroff's command, for him to descend, which he did, accompanied by the German. No sooner, however, had this worthy reached the ground, than he pulled a rope at the side of the ladder, which caused the trap to fall with a noise like the report of a gun. Quick as light he turned on one of the soldiers, and presenting a revolver at him, shot him through the heart. The man sprang upwards with

the convulsive motion peculiar to death so produced, and then fell down a corpse.

Rapidly, before the second soldier had time to seize his revolver, Hermann had sent a bullet crashing through his brain; and then turned the revolver on Kakaroff, who, however, had grappled with him before he could discharge the shot, and when it was fired the ball flew high above his head.

Now commenced a fearful struggle between the two men, both resolute, both muscular, and both apparently well skilled in athletic exercises. The noise of the three shots had alarmed the officers and men above, and efforts were made to raise the trap. Unfortunately the strong springs securing the door held too securely for the efforts of those above to avail in loosening the hold. The crowbar which had destroyed the door leading to Annie's apartments met with resistance from as solid iron here, for the inner part of the trap was thickly coated with metal, so that few men save Hermann could raise it. It was now fastened by the old-fashioned cumbrous springs, which served to hold the entire mass most securely.

While the police above were toiling at the door, the conflict between Hohenhorst and Kakaroff was as deadly as could well be. Each knew that it was for life; each fought with desperation. The sounds above grew louder as iron rang on iron. The prospect for Hermann of escape through some hidden passage became fainter as time was consumed in the struggle with the police-master. This thought seemed to madden him as he grappled with deadlier grip the stalwart form of Kakaroff, whose muscles were beginning to relax. The victory would have been in the hands of the German but for a most unexpected piece of assistance.

During the struggle some person imprisoned in one of the cells parted off from the cellar in the way we have indicated had succeeded in wrenching open the door which had confined him so long, and on which he had, as afterwards appeared, been labouring for many weeks past. Excitement produced by the sounds of strife outside had led him to apply almost superhuman strength in a last, and as it proved, successful effort to wrench off the lock. In the glimmer of the expiring candle which lay on the ground he had just time to recognise the

face of Hermann. He flew at him like a cat, held his throat with both hands so as nearly to suffocate him and to cause him involuntarily to relinquish his hold on Kakaroff, to whom the breathing-time thus gained was of incalculable advantage. In a minute or two he was himself again, and came to the assistance of the new-comer with fresh energy. He disengaged a sword-belt from one of the dead gendarmes, and the two now succeeded in forcing the German to his face on the ground. They then seized his arms, and with the sword-belt bound and strapped them behind him.

"Whoever you may be, you have a friend in me for life," said the police-master. "That was splendidly done!"

Still holding down the prostrate form of Hermann, notwithstanding the secure bandage of his arms, the two new comrades in darkness and danger awaited the result of the attack on the trap-door with feverish anxiety. At last, a blacksmith having arrived with his sledgehammer, the work went on merrily; and when an aperture had been made large enough for the passage of a man with a light, the sense of relief was indescribable.

Soldier after soldier dropped through the opening. Soon there was light and to spare. Soon the hands of Hermann were fastened together with iron handcuffs, the feet were garnished with similar preventives to flight, and the heavy chain between the lower fetters was caught by a leathern support and held up to a belt round his waist. This permitted him to walk, although the clanking of the chain was far from a pleasant accompaniment to pedestrian performances. With great difficulty he was got through the hole in the trap, which had now been made wider to permit of the passage of the bodies of the two soldiers who had met their fate in so sad a manner.

The cellar was now examined, and found to contain a considerable number of arms and a large quantity of ammunition, besides certain suspicious-looking articles, which Kakaroff declared to be dynamite bombs. All these things were taken possession of by the police. An officer was left in charge, and a strong body of budeschniks posted as a garrison, with strict orders to permit no one to enter any part of the premises unless furnished with a special order signed by Kakaroff.

The sad procession of the two unfortunate gendarmes, and the equally mournful spectacle of the fettered desperado, had left before Kakaroff could find leisure to continue his interrogations. He now asked several very minute questions of the guard who witnessed the struggle between Annie and the "girl" in the train on the way to Kursk. Kakaroff further elicited that the two girls had got out some stations this side Kursk.

On hearing this Kakaroff wrote the following words in his note-book:—

"To Colonel Masloff, commanding the Imperial Gendarmes at Kursk.—Try to find and bring to Moscow the Gymnasium pupil, Ivan Dobroff. Wanted immediately.—KAKAROFF."

Besides which, he wrote on another leaf—

"To the Police-master commanding at Kursk.—Will you kindly allow Colonel Masloff to undertake the search for and capture of Ivan Dobroff? I want him here.—KAKAROFF, General and Aide-de-Camp to the Emperor."

He tore these two leaves from the book and sent a sergeant with them to the nearest telegraphic office. The man mounted and galloped off at full speed.

General Kakaroff now commenced the return to his official dwelling in the same order as that in which he had left, save that the strange man who had so unexpectedly risked his life to save that of Kakaroff had been provided for in another carriage, in which an officer of police and a sergeant were likewise seated, with secret orders not to let him escape, but yet to treat him kindly—rather as a guest than a prisoner. Still, behind the carriage rode two mounted gendarmes, and there was a budeschnik on the box with the driver.

Kakaroff drove rapidly, and on the way passed the carriage in which Annie was making the same journey. As his drosky passed she looked sadly on at the window, and Kakaroff nudged Abrasoff, saying, "Are you now quite sure about that face?"

"Yes; it is a face I shall never forget. It is the 'other' girl who was struggling with Ivan when we lost the train; I knew her in the house, but, seen at the carriage window, there is no doubt whatever."

"Just so," said Kakaroff. "I wanted that bit of evidence to complete the case."

(To be continued.)

THE STAR OF THE SETTLEMENT.

A TALE OF THE DIAMOND FIELDS.

By JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XX.—THE RETURN.

JOHN WATKINS had never been in a worse humour than since the departure of the four rivals in search of Matak. As the days and weeks went by it seemed to him that all chance of recovering the precious diamond was rapidly vanishing. And his companions had all gone; and Friedel, Hilton, Pantalacci, even Cyprien, whom he had been accustomed to see so often, were much missed. So he betook himself to his gin,

and, as may be easily imagined, the alcoholic support he administered to his grief was not much calculated to sweeten his character.

At the farm the greatest anxiety prevailed as to the fate of the expedition, for Bardik had been carried off by a party of Kaffirs, and escaping a few days afterwards, had made his way back to Griqualand with the news of the deaths of Hilton and Friedel. Alice was very

unhappy; she sang no longer, and her piano remained dumb. Even her ostriches but slightly interested her. Dada no longer made her smile at its greediness, and impudently swallowed the most extraordinary things without the slightest protest.

Miss Watkins had two causes of alarm. The first was lest Cyprien should never return; the second, lest Pantalacci, the most hated of her admirers, should bring

back "The Star" and claim the reward of his success. The idea of becoming the wife of the Italian was absolutely abhorrent to her. She thought of it by day

to grasp the situation. But scarcely had the first gleam of intelligence struck him than a cry—a cry straight from the heart—escaped him.

"Come in!" she said.

and dreamt of it by night; and her bright cheeks grew paler and paler, and her blue eyes clouded still deeper with gloom.

Three months had passed. It was evening. She was sitting near the lamp in the parlour; her father was on the other side of the table, smoking and drinking as usual. Her head was bent over her woolwork, which she had taken up in place of her neglected music, and in silent and sorrowful reverie she was thinking over her fate.

There came a gentle tap at the door.

"Come in!" she said, somewhat surprised, and wondering who it could be at such an hour.

"It is only I, Miss Watkins," said a voice which made her start—Cyprien's voice!

He had come back—thin, sunburnt, with a long beard which disguised him, and clothes faded and worn by travel, but active and courteous and cheery as ever.

Alice jumped up and uttered a cry of astonishment and gladness. With one hand she strove to check the beatings of her heart; the other she held out to the engineer, and he was clasping it in his when Mr. Watkins awoke from his slumbers and asked,

"What's up?"

It took the farmer two or three minutes

"And the diamond?"

The diamond, alas! had not come back.

Cyprien briefly told the story of the expedition. He related the death of Friedel, of Hilton, of Pantalacci, the pursuit of Matakai and his imprisonment by Tonaia—without mentioning his return to Griqualand—and explained his reasons for feeling sure of the Kaffir's innocence. He did not forget to mention the devotion of Bardik and Li and the friendship of Barthes, and enlarged on what he owed to the gallant hunter, and how, thanks to him, he had been able to return with his two servants from a journey that had proved fatal to his companions. He said nothing of the criminal schemes of his rivals, and he did not forget his promise to keep the secret of the wonderful grotto and its mineral riches, to which those of the Griqualand diamond field were as worthless ballast.

"Tonaia," said he, in conclusion, "faithfully kept his engagements. Two days after I reached his capital everything was ready for our return—provisions, teams, and escort. Under the command of the king in person about three hundred blacks with flour and smoked meat accompanied us to the camp where we had abandoned the waggon, which we found untouched beneath the brushwood we had heaped upon it. We then bid good-bye to our host, having given him

five guns instead of the four he expected, and thus made him the most redoubtable potentate between the Limpopo and the Zambesi!"

"But how about your return journey when you left your camp?" asked Miss Watkins.

"Our return journey was slow, but devoid of accidents. Our escort left us at the Transvaal frontier, where Pharamond Barthes and his Basutos separated from us to go to Durban, and after a forty-days' march across the Veld here we are very much as we were before we left."

"But why did Matakai run away?" asked Watkins, who had listened to the recital with much interest, without showing the slightest emotion about the three men who would never return.

"Matakai fled because he was afraid."

"Is there no justice in Griqualand?" asked the farmer.

"Yes, but justice that is often too summary, Mr. Watkins; and I hardly blame the poor fellow, when wrongfully accused, for having thought it best to disappear during the first excitement at the diamond's loss."

"Nor do I," said Alice.

"And I repeat that he is not guilty, and I think they will leave him alone for the future."

"Hum!" said Watkins, apparently unconvinced. "Don't you think Matakai shammed that fear, so as to get out of reach of the police?"

"No! He is innocent! I am sure of it," said Cyprien, rather drily, "and I think that I have bought the assurance rather dear."

"Oh! You are welcome to your opinion, and I am welcome to mine."

Alice saw that the discussion was likely to end in a dispute, and so struck in by way of diversion with—

"Do you know, Mr. Cyprien, that during your absence your claim has turned out a splendid one, and that your partner, Mr. Steel, is on the road to become one of the richest diggers in the Kopje?"

"No, I did not," answered Cyprien, frankly. "My first visit I paid to you, Miss Watkins, and I know nothing of what has happened during my absence."

"Perhaps you have not had any dinner?" asked Alice, with the instinct of the thorough little housewife that she was.

"I am sorry to say I have not," said Cyprien, blushing, though why he blushed he did not know.

"Oh! But you must not go without food. An invalid like you—after such a trying journey. Why it is nearly eleven o'clock!"

And without heeding his protestations she ran to the kitchen, and reappeared with a tray covered with a spotless cloth, and bearing some cold viands and a beautiful peach tart that she herself had made.

The tray was deposited in front of Cyprien, who seemed much confused, and as he hesitated to use the knife on a superb "biltong," a sort of preserve made of ostrich,

"Shall I cut it for you?" asked Miss Watkins, with one of her sweetest smiles.

And the farmer suddenly getting hungry at the sight of the gastronomic display, asked for another plate and a slice of biltong. Alice was delighted to wait on them, and merely to keep the gentlemen company, as she said, began to eat a few almonds.

The hurriedly-prepared supper was simply delightful. Never had the young engineer experienced such a triumphant appetite. He had three helpings of peach tart, and quite won the heart of Mr. Watkins, who, however, soon dropped off to sleep.

"And what have you been doing during the last three months?" asked Cyprien. "I am afraid you have forgotten all your chemistry."

"No, sir; you are wrong. I have been working very hard, and I have been trying some experiments in your laboratory. Oh! I didn't break anything! You needn't look so frightened. I am very fond of chemistry, and cannot understand how you could leave such a splendid science to become a digger or a bushman."

"But you know why I gave up chemistry."

"I know nothing," said Alice, with a blush, "and I think you were wrong. Were I in your place I should try and make another diamond. That is much better than looking for one underground!"

"Is that an order, then?" asked Cyprien, with his voice all of a tremble.

"Oh, no!" answered Alice, with a smile, "only a request. Oh, Mr. Cyprien," she continued, more seriously, "if you only knew how unhappy I have been in knowing that you were exposed to all the fatigues and dangers you have been through. You have not told me all, but I can guess. A man like you, so learned, so well prepared to do good work and make great discoveries, ought not to have been exposed to perish in the desert from the bite of a snake or the grip of a lion without any gain to science or humanity. It was so wrong to let you go; and it was only by a miracle that you escaped to come back. Without your friend Mr. Barthes—"

She did not finish, but the tears welling up into her eyes completed the thought for her.

"Those tears," said Cyprien, "are more precious to me than all the diamonds in the world, and make me forget all my troubles."

There was a short silence, which Alice broke with her usual tact, by resuming her account of her chemical studies.

It was past midnight when Cyprien returned to his hut, where a packet of letters awaited him, carefully arranged on his work-table by Miss Watkins.

These letters, reaching him after so long an absence, he hardly dared open. If they brought him news of some misfortune! His father, his mother, his little sister Jane! So many things can happen in three months!

He rapidly glanced through them, and found they contained nothing but good news. All his people were well. There were the warmest congratulations on his excellent theory of diamond formation. He could stay another six months in Griqualand if he thought his doing so would be in the interests of science. Everything was for the best, and Cyprien went to sleep with a lighter heart than he had had for many a day.

In the morning he visited his friends, and stayed some time with Thomas Steel, who had been working to considerable purpose. The hearty Lancashire lad received his partner with the greatest cordiality. Cyprien arranged with him for Bardik and Li to resume work as

before, intending, if they were successful, to give them a share in the claim.

On his part, he had given up all thoughts of again trying his hand at digging, and, in accordance with Alice's wish, resolved to resume his chemical researches.

His conversation with her had confirmed him in his own ideas. He had for some time thought that his true course was to abandon the rougher work, and leave travel and adventure alone. Too loyal and faithful to his word to think for an instant of abusing the confidence of Tonaia, and profiting by his knowledge of the cavern with its marvellous minerals, he found in it a valuable confirmation of his theory of gems, which could not but increase his ardour in research. And so he returned to his laboratory and resumed his investigations.

And he had a strong incentive to do so, for since the artificial diamond had been lost, Mr. Watkins said no more about his daughter's marriage. If the engineer could make another gem of extraordinary value, the farmer might again be induced to entertain the subject.

And so Cyprien resolved to set to work without delay, and made no attempt to conceal his proceedings from the diggers of Vandergaart Kopje. It would have been well, perhaps, had he done so.

crystallise the carbon—that is to say, make the diamond—is a proper solvent, which by evaporation or cooling will give the crystallisation. We have a solvent for aluminium in sulphide of carbon, and by analogy we must find something similar for carbon, such as boron or silicon."

Although Cyprien was not in possession of this solvent he went on with his work. Instead of Mataka, who prudently kept away from the camp, Bardik was employed in keeping in the fire night and day, a task he fulfilled as zealously as his predecessor.

In the meantime, foreseeing that after this prolongation of his stay in Griqualand he would have to leave for Europe, Cyprien started on another item in his programme, which he had hitherto left untouched. This was the determination of the exact position of a certain depression in the north-east of the plain, which seemed to have been the spot where the waters debouched at the time the diamondiferous deposit was formed.

Five or six days after his return from the Transvaal he was working at this with all his usual precision. For an hour or more he had been placing his poles, and noting his bench marks on a fully detailed map he had procured at Kimberley, and, strange to relate, in

Tonaia's Escort.

He obtained a new tube of great resisting power, and filled it in the same way. "What I want," said he to Alice, "to

every case he found that nowhere did his figures agree with the plan! At last, after repeated trials, there was no resist-

ing the evidence that the map was out of truth as regards its compass bearings,

He was using an excellent chronometer, that had been duly rated, and

"The map was entirely wrong."

and that the latitudes and longitudes were erroneous. which he had specially brought out with him for the purpose of determining the

longitude, and the time was high noon. Hence, feeling assured of the infallibility of his compass and his declination needle, he had no hesitation in deciding that the map on which he was marking his observations was entirely untrustworthy, owing to some serious oversight.

In fact, the north of the map as shown by the arrow was really the north-north-west, and all the positions had necessarily to be altered.

"I see what it is," Cyprien suddenly exclaimed, "the asses who did this forgot to allow for the variation, and that is nearly twenty-nine degrees west! All their latitude and longitude lines ought to be swung round twenty-nine degrees! They must have been funny surveyors that produced this masterpiece."

And he chuckled loudly at the blunder. "Well, to err is human. Let him throw the first stone at these fellows who never made a mistake in his life."

Cyprien had no reason for keeping secret the rectification he had made in the orientation of the diamantiferous beds of the district. As he was returning to the farm he met Vandergaart, and casually mentioned it to him.

"It is very curious that such a huge mistake was not found out before. It affects all the maps of the district."

The old lapidary pricked up his ears and looked Cyprien straight in the face.

"Are you sure you are right?" he asked.

"Oh, yes!"

"And will you swear it in a court of justice?"

"In a dozen courts if you like."

"And no one can deny what you say?"

"Certainly not; I should only have to point out the mistake. It is open, gross, palpable. They have omitted the magnetic variation, that is all."

Vandergaart shook hands and walked off without another word, and Cyprien soon forgot the strange way in which the intelligence had affected him.

But two or three days afterwards, when he went to call on the old lapidary, he found the door shut. On it was a notice, "AWAY ON BUSINESS."

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXXIV.

MONEY is a great institution. What glorious times we should all have if only the £. s. d. were forthcoming in sufficient quantities. What a nuisance it is when one has some grand scheme in one's brain which will inevitably bring honour and glory when completed, to find that "the want of pence" puts a complete stopper on our cherished plan. How can one be expected to make a score with this old sprung lump of willow? Ah, if only that splendid match bat were ours! wouldn't the hundred soon appear on the telegraph board!

There are different ways of spending money. Some like to lay it out on fleeting pleasures — "truck," riding, shows. Others, when they get a windfall, are

more careful, and buy a long-desired book, to which they can return many times. But the greater number of those who come into money unexpectedly let it depart with equal lightness.

When Fanshawe found he was a legatee to the extent of a clear hundred pounds he was in the seventh heaven of delight. He was in debt, not to any great extent, but just enough to make him uncomfortable. Mr. Ferris, the tailor, was apparently uneasy in his mind, and had made several calls on him, at one of which he had expressed himself strongly.

"I tell you what it is, Mr. Fanshawe, I haven't got enough time to be always looking you up."

"Haven't you?" retorted Fanshawe,

who was angry at being dunned. "You ought to have time enough, for I'm going to pay you in time."

But Mr. Ferris did not see the point of the joke, and returned to the charge (which was six pounds ten).

"I'm not going to have any more shillyshallying," he said, decidedly, "and if this money isn't paid by Wednesday I go straight to your governors and lay a complaint."

Fanshawe was not dismayed by the threat, only annoyed. It would be a nuisance to have all the fellows know the state of his finances. At the same time they would probably "take it out of" the tailor should he be ill-advised enough to venture into the office where

Fanshawe and his fellow-clerks spent as little time as possible.

So Fanshawe was very pleased to be able to pay off Ferris, and show him what a mistake he had made in trying to bully him. Mr. Ferris begged his pardon most humbly, and entreated the continuance of his favours, but Fanshawe rode the high horse, and went to a better, or at least a more expensive, man.

Finding himself in the very unaccustomed position of having eighty pounds to spare, he decided that he could spare some of them very easily, so he proceeded to have a high time of it for a fortnight. He went out every night, spent a pound or two in giving a supper, bought a few trifles in the way of jewellery, had a hack once or twice, went to the music-hall pretty frequently (a proceeding necessitating a considerable expenditure in drink), and generally lived the sort of life which he liked. However, at the close of the fortnight he happened to have occasion to make up his accounts, and was surprised to find that he had spent twenty-eight pounds out of the eighty.

"This won't do," he soliloquised; "I'm a fool and no mistake. I might be a lower-school boy with a half-sovereign from the way I've been flinging my cash about. Where the mischief it's all gone is more than I can tell."

He had a heavy fit of repentance on that day, for the previous evening he had indulged in unlimited "brandies," and was suffering the natural consequence. The fit lasted long enough for him to go to the Birkbeck Bank and deposit fifty pounds.

"I won't touch that for a couple of months," he said to himself. "My allowance is due next week, and I'll worry along on that."

His resolution lasted for about six weeks. By that time his quarter's allowance was gone, for it is impossible for such as he to be as careful as usual of money when they know they have fifty pounds in hand, only waiting to be drawn out.

So it happened that, by the beginning of May, things were in a not much better condition with Fanshawe than they were before he had his legacy.

And what had he to show for his money? Some studs, a pair of gold sleeve-links, a good ebony walking-stick with chased silver top, two suits of clothes, a hat or two, four novels, a fine collection of empty bottles, and a file of receipts. Anything else? Yes, a meerschau pipe, value three pounds; and a conscience more seared than before.

Not much of a show for eighty or ninety pounds. And more than that, Fanshawe had got into a habit of spending far more than formerly in questionable amusements, and it would be a nuisance, he thought, to fall back into his old ways.

He had forgotten Lang during the last few months. He had called at Mrs. Turner's soon after Lang had returned home, and hearing that he had left town, and was ill, had given up all thought about him for a time. Lang owed him money, but he had no need of money just now; besides, Lang was safe enough. It would be rather pleasant to know that when his cash was all gone he could fall back on Lang.

So it happened that the morning of the day on which Garland had made Lang

confess the fraud, Fanshawe was employing his time at the office in reckoning up his liabilities and assets. The result was not gratifying.

"Hullo, Fan," said one of his companions known as Dick, "what's up? You look as if you'd lost a threepenny-bit."

"That's a misfortune that won't happen to you," retorted Fanshawe.

There was a general laugh at this, for Dick was known to be in a constant state of impecuniosity.

One of the partners came in at this juncture, and every one glued his eyes to the desk. When he had departed Fanshawe renewed his calculations.

"I owe that fellow Turner six fifteen," he said to himself, "and he's written three times and threatens to county-court me. I suppose he means business. I must get the cash somewhere. I'll try Lang, I think. He must have come back to town by now."

Lunch time came, and Fanshawe as usual was the first to take his hat and go. He ran down the stairs and into the arms of a seedy-looking man who had a pen behind his ear.

"Beg your pardon, sir," said the man, who, however, still stood between the door and the stairs. "Could you tell me if Mr. Fanshawe's office is up here?"

A sudden thought came to Fanshawe. He had never seen the man before, but he knew in a moment that he was an officer, and had in his pocket a summons for him. He was, as we know, not the man to stick at trifles to serve his own ends.

"Mr. Fanshawe? Oh, yes. You'll find him on the second floor, first door on the right."

"Thank you, sir. What sort of a man might he be?"

"He's a sandy-haired fellow, with short whiskers and no moustache. Anybody will tell you which it is."

"Thank you, sir. Good morning."

The man crept cautiously upstairs with his hand in his breast-pocket. Fanshawe waited till he was out of reach, and then walked quietly out.

"That was a narrow touch," he said to himself; "it's lucky he came just at lunch time. Poor Dick! he'll get a fright when the fellow is on him. Serve him right; he's played me many a trick before now. But what a sell for Turner and Co.!"

Turner and Co. were his new tailors, who did not show any more inclination to give him long credit than Mr. Ferris had. Fanshawe was almost sorry he had left Ferris, who seemed to regret his harshness when he was paid. But in the meantime Turner's account must be settled.

"I shan't be able to go back to the office to-day," thought Fanshawe. "That fellow will be certain to come to my rooms to-night. I must tell Mrs. Gunter to be sure to say I'm out."

He spent the afternoon in the park, and strolled back to Mrs. Turner's about five, hoping to catch Lang in. How lucky it was that he had not bothered him about his debt before. If he had he would not have been able to fall back on it now, when it was urgently needed.

"Yes, sir, Mr. Lang is in," said the servant, in reply to his inquiry.

He was shown into the breakfast-room, in which boarders received private visi-

tors. Lang came down a few minutes later.

It had caused him a shock when Fanshawe was announced. He had to make up his mind in a minute. In the first place he owed him money, on that point there could be no doubt. But he might send that. Next, he wanted above everything to cut Fanshawe—to never see him again. Since his confession to Garland he looked upon his old companion with perfect detestation.

However, he decided he must see him.

"Hullo, Lang, here we are again!" was Fanshawe's greeting. "How are you? I heard you'd been jolly ill."

"Yes, so I have."

"Knocked yourself up with working too hard for matric?" laughed Fanshawe.

Lang gave a frightened glance around the room.

"Don't speak of that," he whispered, "I wish I'd never done it."

"But you did," retorted the other, lightly, "so you may as well make the best of it. When are you going to sign your articles?"

"I don't quite know. July, I expect."

"Lucky beggar you are to have saved a year's drudgery. But I say, old boy, you haven't forgotten our little arrangement?"

"No," muttered Lang.

"Very well, then; you recollect we haven't had a final squaring up yet. When shall we have it? The sooner the better, for I'm as hard up as a lower schoolboy."

"I'm sorry for that," faltered Lang.

"Not so sorry as I am. You can't say I've not given you rope enough, old boy. How long ago was it you were to have paid up?"

Lang did not know, but he was ready to acknowledge that he had overstepped the mark.

"I'll give you what I can," he said; "yet Pater allows me so little that I only have a pound or two."

"Now look here, Lang, you owe me money, and you'll have to pay it, you know. You must borrow it if you haven't got it. Why, hang it, man, there's a fellow at my rooms this very minute with a summons in his pocket for this very suit of clothes I'm standing in. If I don't pay up to-morrow there'll be a pretty shine."

"I'll see if I can get it for you," said Lang. "I'll try and send it you to-night."

"Don't forget it," said Fanshawe, "because it would be uncommonly awkward for me—and perhaps for you," he added.

What did he mean? Lang was afraid to ask. He thought it was a veiled threat, intimating that there was a means of extracting the money if persuasion did not have its due effect.

"I won't forget," he said; "don't be afraid." He rose to try and show the interview was ended. Fanshawe took the hint and his hat, shook hands, and departed.

CHAPTER XXXV.

WHEN Lang met Garland that evening by appointment he had to tell him of Fanshawe's visit. He had no secrets from Garland now. It was a great relief to have some one to whom he could unburden his mind.

His first sensation of relief had, however, to a great extent vanished. It

was an immense load off his mind to find that Garland, whom he so admired and liked, had not turned away from him on finding out the manner of man he was. For a few hours he was almost elated; then came the reaction, intensified by Fanshawe's visit.

"It's all up, Garland," he said, after detailing his conversation with his tempter. "He says he must have the money, and I've promised to send it him to-night, yet I don't know where I'm going to get it."

"I wish that were the greatest difficulty," said Garland, kindly. "I can lend you seven or eight pounds, if that will do. You can pay me back when all this is over. I dare say you would sooner have me for a creditor than him."

"Garland, you're the best fellow in the world," cried Lang, warmly. "I only wish I deserved what you are doing for me."

"Oh, nonsense; you'd do as much for me. Let's get that part of the business over first. Just wait half a minute. I'll get Mr. King to write a cheque and you can send it off at once."

Lang could only murmur his thanks. He felt as if the most pressing danger were over when the letter was sent to post.

"Now," said Garland, on his return, "just settle down in that chair, because we have a good deal to talk over."

Lang obeyed. He was ready to obey in anything.

"What are you going to do?" asked Garland.

Lang looked up surprised. What could he do?

"What would you advise?" he asked, humbly.

"In the first place, of course, you mustn't dream of signing your articles."

"But if I don't every one will find it out, father will want to know the reason, and I shall have to bolt and hide like Melhuish."

Garland left him to go on.

"No, you're right," he continued; "I can't sign my articles; that's fixed, at any rate. I've had enough shuffling and deceiving, I'm going to be straight now."

"Of course," said Garland. "What sort of a life would you lead with the constant fear of some one's turning up and saying, 'Come out of that, you cheat; you've no business to be a solicitor'? No; there's only one way out of it that I can see."

"What's that?"

"You must pass the matriculation in June."

"But I'm already supposed to have passed it."

"That makes no difference. We want to stand you on your legs, so you must begin at the point where you went wrong. You have almost six weeks before you; you have been working well lately, you ought to be able to pass. In fact you

can do. It is underhand to a certain extent, and I hate anything done in secret, but there is no help for it."

"I'll do it," cried Lang, who saw the path clearing before him. "I'll work day and night. I know the subjects pretty well, for I used to work at them at Christmas time to keep my thoughts off the miserable business."

"Yes, it's a miserable business enough as it stands," said Garland. "If this does come to light you would certainly be liable to be punished for fraud."

"Yes; if I signed under false pretences."

"In any case the guilt is the same."

"Yes," said Lang; "I know that only too well. Only five weeks and a day or two! I shall have to stick at it."

"I tell you what I'll do," said Garland. "I have to read some classics for practice, so I may just as well read your subjects with you."

"Thanks, awfully, I shall get on ever so much faster."

"You must let your law slide for the next few weeks."

"That will be easy enough," said Lang, sadly. "I've only been playing at it."

"Then do your best, and remember how much depends on it. Pass your exam., and you will be able to sign your articles with a free conscience, knowing that you've earned the right to the year's exemption you claim. If you fail, you must either postpone entering till after the next exam., or else go in for the preliminary and face the explanation which must come out."

"I'll do it," said Lang, determinedly. All seemed bright and smooth now. He was clear of Fanshawe, he need never see him again and never would. Once pass his exam. and the whole of that unhappy episode in his existence would be blotted out for ever.

So Lang thought. But he had to learn that the consequences of evil deeds are not always so confined as we should wish. Even repentance is not invariably sufficient to destroy them.

(To be continued.)

"He ran into the arms of a seedy-looking man."

must; it's your only chance of avoiding exposure."

"But won't they find it out?" asked Lang.

"No, I don't think so. Your name is not an uncommon one. You must make your application to be allowed to go up from a different address; that may help you. And you must keep the fact of your going up a secret from every one."

"I see," acquiesced Lang.

"It's the sort of job I don't like at all," continued the other, "but it's the best we

A SCHOOLBOY'S ADVENTURE WITH MOONLIGHTERS.

BY JAMES COX, R.N.,

Author of "Fascinated by a Fakir," "How I Saved My Aunt's Diamonds," etc.

CHAPTER II.

"At last!" exclaimed Charley, as the car stopped at a large iron gate flanked by a lodge. "Here we are."

An old woman, on hearing the sound of the wheels, came out, and after fumbling at the lock for a few minutes, threw open the gates, and gave admittance to the colonel and his escort.

A short drive through an avenue, and the car was pulled up in front of a large house, from one of the upper windows of which a solitary ray of light gleamed out into the darkness.

In response to a hearty pull of the bell, the said window was cautiously raised a few inches, and a sweet voice was heard saying,

"Is that you, papa dear?"

"All right, Eileen darling. Tell Dan to let us in at once."

The window was closed, the light disappeared, and a few seconds later there was a sound of the removal of bars and chains from the hall-door. Another moment, and the door was thrown wide open, disclosing to view a very pretty girl and a white-haired old man who held a candle above his head and peered out into the darkness.

"Welcome home, papa dear!" said the former, throwing herself into the colonel's arms and kissing him.

"And you too, Charley!" exclaimed the young lady, as she disengaged herself from the embrace of her father and threw her arms round Reggy's neck, much to that young gentleman's astonishment, and gave him a hearty kiss.

"Oh! oh! oh!" shouted Charley, in intense glee. "You are as bad as the policeman. Never mind, Reggy, old fel-

low, you needn't look so uncomfortable; she won't do it again."

"Where's your aunt, Eileen?" asked the colonel, to cover the confusion and divert attention from the mistake his pretty daughter had made.

"Oh, papa dear, the moment you went away she locked herself up in her room, piled all the furniture against the door, and made old Dan march up and down outside with the blunderbuss. She's dreadfully nervous."

"Poor old lady! However, let's get in. I suppose there's a fire in the dining-room."

Mickey and the policeman drove off to the stables, and Eileen led the way into the dining-room, where, after the colonel and the two boys had divested themselves of their great-coats and wraps, they all sat down and did ample justice to the supper which Eileen had thoughtfully prepared for them.

After the meal was concluded the colonel looked at his watch. "Come, Charley, show Reggy his room; do you know it's nearly midnight? and no doubt he'll be glad to get to roost after his long journey."

"This way, old chap!" cried Charley, lighting a candle in the hall and conducting his guest up a wide oak staircase to a long corridor on the first landing. "Your crib is next mine at the end of this passage. I say, Reg., you ain't afraid of ghosts, are you?"

"Not a bit! Why?"

"Well, it's said—but of course I don't believe it—that once a year the ghost of old Oliver Cromwell haunts this wing of the house. This is a precious ancient house—at least one part of it is—and there's a yarn that when Cromwell was over in Ireland he stayed in it, and had Lady Desmond, to whom the place belonged, put to death for harbouring some rebels. I'm not sure, though, whether it's Cromwell's ghost or the old lady's that haunts the place. Perhaps it's both of 'em; I'll ask old Dan to-morrow. Here we are. Good night."

Reggy turned into bed pretty smartly, for he was tired and glad to get to rest; but he found it rather more difficult to fall asleep than he had anticipated. The strange bed and surroundings, the long journey, and the tragic death of Biddy's cow, kept him awake. At last, however, as the clock on the stairs struck the hour of one, he turned over on his side for about the twentieth time and commenced saying the alphabet backwards, hoping that this monotonous mental exercise would have the desired effect. He had just arrived at the letter O when a noise resembling a stealthy footfall in the corridor near the door attracted his attention, and he at once sat up and listened.

"I wonder who can be wandering about at this time of night?" thought Reggy, feeling a little uncomfortable. "Ghosts? Phoo! that's all nonsense; there are no such things! Hallo, though! What's that?"

By the feeble light emitted from the dying embers of the fire in the grate he saw, or fancied he saw, a small white hand glide round the edge of his door, which he had left ajar, and flutter for a moment over the place where the lock should be, as if feeling for a key. Before he could recover his astonishment the hand was withdrawn, and he heard footsteps rapidly passing along the passage, while a weak, quivering voice outside muttered in low tones, "This house will be the death of me, I know it will!"

Reginald sprang out of bed, saying to himself, "One of Master Charley's tricks! I'll serve him out for this!"

Flinging the door wide open, he peered into the darkness. "Surely I'm not dreaming!" he thought. "What was that at the far end of the corridor, where the light from an open door streamed across the polished oak floor? A little old woman in white, with a peculiar-shaped scarlet cap on her head, appeared to his astonished gaze for one brief moment in the spot thus illuminated, and instantly disappeared, the light vanishing."

"Very odd," thought the boy. "Can there be any truth in what Charley told me?"

Returning to his bedroom, Reginald lit his candle and proceeded to his chum's bedroom. There he found Charley, fast asleep and snoring contentedly.

Then he walked down the whole length of the corridor, and stopped for a moment opposite the door at the upper end, where he imagined the apparition had disappeared. All was quiet; and so, thinking perhaps that he must have been dreaming after all, he returned to his own room, blew out the candle, got into bed, and fell asleep.

"Hallo, Reggy! Rouse out, old chap! I've been hammering at your door for the last five minutes! Look sharp, or you'll be late for breakfast!"

Reggy, thus admonished, sat up in bed and told Charley to come in.

"Why, how white you look, Reg.! Had a bad night's rest, eh?"

"Yes," said Reggie, yawning. "I can't say I slept very well. Strange bed, you know. However, I'll look sharp and dress now."

As Reggy turned out and commenced dressing, the vision of the old lady flashed across his mind. "I don't think I shall say anything about it to Charley," he muttered, aloud; "I may have dreamt it."

On reaching the breakfast-room Reginald found Colonel Fitzgerald, the fair Eileen, and his schoolfellow already seated. Eileen was presiding at the head of the table, and looked, if possible, prettier than ever. She smiled as their guest entered the room, and motioned him to a chair on her right.

"I hope you slept well last night?" she said as she helped him to a cup of coffee.

He was about to answer when the door

was suddenly opened, admitting an elderly lady, who trotted nimbly across the room and seated herself in a vacant chair opposite to him. Her dress was somewhat quaint, of a fashion long out of date, and her manners were rather peculiar. She looked sharply at Reginald, and then, turning to Colonel Fitzgerald, gave an angry sniff, and in a rasping tone of voice said, "Fitzgerald, you ought to have known better than to have brought that boy here!" Then, jerking her head round, and fixing Reg. with her little grey eyes, exclaimed, "Boy, is your life insured?"

"My what, madam?" replied Reggy, feeling slightly astonished at the lady's brusque behaviour.

"Your life, boy!—your life! Poor innocent! don't you know that you are surrounded by assassins, Moonlighters, dynamitards, and blackguards of all descriptions? Oh, dear! oh, dear! why did I leave Dublin?"

Reggy mumbled out something to the effect that he did not think his life was insured, but would ask his father, on which he received a kick under the table from Charley, and, looking up at that young gentleman, saw that he was doing his utmost to suppress a violent attack of laughter. Eileen whispered at the same moment to him, "You must excuse aunty, she's so dreadfully nervous, poor dear!"

There was silence for a few moments, presently broken by Eileen saying to

Reginald, "You didn't tell me how you slept last night?"

"Sleep, indeed!" said the old lady; "who *can* sleep in this house? I tell you, boy, that since I was foolish enough to leave Dublin to come to this place I never go to bed without expecting to wake up some morning to find myself murdered!"

"Bravo, aunty?" cried Charley. "A regular Irish bull that!"

"Silence, Charles!" rejoined the lady, with dignity.

After breakfast the colonel retired to his study, and the two boys and Eileen went to the stables, as Charley wanted to show Reggy the horse that he was to ride during his stay at the Castle.

On their way Eileen said, "I'm afraid you had a bad night's rest. Did you dream of Lady Desmond's spirit? Charley told me that he had been telling you that stupid story."

Reggy looked a little confused, and little by little Eileen drew out of him the account of the mysterious apparition.

"What was the ghost like?" asked Charley.

"I didn't see her face; but I know she was dressed in white, and wore a very bright red cap."

"A what?" exclaimed Eileen, with a smile.

"A red cap."

Eileen clapped her hands, and her bright eyes gleamed and sparkled with amusement.

"Oh, Charley, the mystery's out! It

was Aunt Mary! You know, Charley, she never can rest until she has locked every door in the house. Don't you remember the last time you were home she locked you in, and afterwards forgot where she put the key? How fortunate it was there was no key to your door!" she added, turning to Reggy.

"Now then, Mick, let's have a look at the horses!" exclaimed Charley.

"What do you think of this beauty, Reg.? Father bought her for Eileen last year. That animal in the next stall is the colonel's, and this chap—dear old Nero—is my own, which I shall turn over to you. I shall use the governor's."

Charley, having expatiated on the merits of the horses, next proceeded to show his chum over the grounds, and together they explored nearly every nook and corner of the demesne.

"Our place doesn't look up to much, you know, at this time of the year; but you should see it in summer, when the woods are green? What do you think of it, Reg.?"

"Well, it looks a wee bit gloomy, but I'm sure I shall enjoy myself very much. I suppose you have some neighbours to come and enliven you up?"

"Well, yes; we have one or two, but they seldom look us up now, and the nearest place to ours is quite five miles away. However, come along; we'll have the horses saddled and go for a gallop across country."

(To be continued.)

HEROES OF THE BACKWOODS.

II.—JOHN STARK.

THE most trusted lieutenant of the Rangers was John Stark, who afterwards rose to considerable eminence during the Revolutionary War. He was born at Londonderry, in New Hampshire, in 1728, his father being Archibald Stark, a Glasgow man, who landed on the Kennebec in 1721.

John Stark's first recorded adventure is a thrilling one. On the 28th of April, 1752, when out trapping with his elder brother William, and two friends, Stinson and Eastman, the party was surprised by ten St. Francis Indians. The Indian trail had been struck two days before, and the Starks were preparing to leave the ground, John being away from the rest collecting the traps.

The Indians found him alone and captured him, and on asking about his companions Stark gave such information as led them a couple of miles out of the way. Unfortunately the three trappers, thinking he had lost himself, fired their rifles as a signal, and this betrayed them to the savages, who made their way to the river to intercept their canoe as it returned.

The trappers, suspecting what had happened, slowly came down the river—William Stark and Stinson in the canoe, and Eastman scouting on the bank. At sunrise Eastman fell into the hands of the Redskins, who at the same time ordered Stark to hail his brother and decoy him ashore.

Instead of doing as he was requested, John coolly hailed the canoe, told William how they were situated, and advised him and his friend to paddle to the opposite bank. They did so. Four of the Indians fired at them. As the guns went off Stark knocked up two of the barrels, and the men in the canoe were untouched.

Again the Indians fired, and again did the trapper knock up two of the rifles. And then he shouted to his brother to paddle for dear

life, as all the guns were discharged. The canoe was driven furiously across the stream, but before it was out of range one of the Redskins had reloaded, and with a long shot killed Stinson. William Stark escaped; we shall meet with him again.

The Indians took the furs the party had collected, and having given Stark a good drubbing for his pluck, marched him and Eastman off into captivity at St. Francis. Here they were made to run the gauntlet—that is, run between two lines of Indians armed with heavy sticks, who struck at them furiously as they passed.

Eastman was severely handled as he went through, but Stark snatched a cudgel from the first man he came to, and dashed down the lane, hitting out right and left, and scattering the astonished Indians in all directions, greatly to the delight of the old men who witnessed the scene and heartily enjoyed the confusion of their young warriors.

With these Indians Stark remained three months, and was admitted into the tribe as a chief, owing to the respect they entertained for him. They at the outset ordered him to hoe their corn; but he, knowing that such work was in their opinion only fit for squaws and slaves, deliberately occupied himself in cutting up the corn and sparing the weeds. The Indians were naturally rather cross at this, but did not relieve him of his task. And so he threw away his hoes into the river, telling them that it was "the business of squaws and not warriors to hoe corn." The sentiment pleased his masters, and he was adopted as the son of the Sachem.

Soon afterwards two commissioners from Massachusetts arrived at the village to redeem prisoners, and finding Stark and Eastman there, ransomed them at the rate of one hundred and three dollars for Stark, and

sixty dollars for the less appreciated Eastman.

The next year Stark was out trapping up the head waters of the Androscoggin, and bringing back a favourable report of the district, was attached as guide to Lovell's exploring expedition, then fitting out at Concord for the upper Coos country. In 1754 Stark was the guide to another expedition, that which first explored the fertile meadows on the banks of the Connecticut about Haverhill and Newbury.

In the winter of 1756 the Rangers were raised under Rogers, and Stark was chosen by him as lieutenant. In the April following he arrived at Fort Edward, and was told off to scout round Ticonderoga and Crown Point. Soon afterwards he took part in the defeat of the French at the Bloody Pond, where on the same day and on the same field there were three several battles, with the loss of three commanders and an Indian chief. The commanders were Colonel Williams and Captain McGinnis, and the French general Baron Dieskau; and the Indian chief was the famous Hendricks, the leader of the Mohawks. Dieskau was captured mortally wounded, but lived to reach England.

On the 21st of January, 1757, the Rangers, seventy-four strong, were snow-shoeing up Lake Champlain, when they sighted a sled on the road from Crown Point to Ticonderoga. Stark, with twenty men, was ordered to head it, while Rogers cut off its retreat. Rogers soon saw ten other sleds passing down the lake, and tried in vain to warn Stark before he showed himself on the ice. The moment Stark appeared the sleds hastily turned back, and the Rangers pursuing, took seven prisoners, three sleds, and six horses. From the prisoners they learnt that there were then over a thousand men in Ticonderoga; and, fearing immediate pursuit, Rogers

gave the word to march back to the fires they had kindled the night before, and prepare for battle by drying their guns, as the rain had come on.

In single file, Ranger-fashion, they "advanced half a mile over broken ground, and passed a valley of fifteen rods breadth, when the front, having gained the summit of the opposite hill on the west side, fell in with the enemy drawn up in the form of a crescent to surround them, and were immediately saluted with a volley of two hundred shots at a distance of five yards from the nearest and thirty from the rear of the party." A move was ordered to the opposite hill, where Stark was already covering the retreat. The pursuit was close, but Stark's fire was so deadly that the French were driven back so as to allow of the line being re-formed.

The French and their Indian allies then attempted to outflank the Rangers, but the attempt failed. The Rangers made the most of their shelter behind the large trees on the hill, and kept the enemy at bay till sunset. Stark was the only officer not wounded, and when a retreat was spoken of declared that he would shoot the first man who fled. He had the lock of his gun shot away, but jumped out of his shelter and seized a rifle from a dying foe.

Rogers was hit twice—once in the head, once in the wrist; and it is related as a curiosity of surgical practice that one of the men cut off the major's queue and used it to stop the hole in the major's wrist.

In the darkness the Rangers retreated, and next morning reached Lake George, six miles south of the French advanced guard, and forty miles from Fort William Henry. The wounded were unable to march any farther, and Stark, with two of his men, volunteered to proceed to the fort for sleds.

The snow was four feet deep on the level, and could be traversed only on snowshoes, and yet the three Rangers reached the fort before sundown, and returned with the sleds by the next morning. The Rangers had lost fourteen killed, six wounded, and six captured, out of seventy-eight; the French had one hundred and sixteen killed out of two hundred and fifty. Stark was promoted to be captain in place of Spikeman, who was killed in the action.

In the following March, Stark was at Fort William Henry, and defeated the French attack under somewhat curious circumstances. Among the regular troops then in garrison were a number of Irishmen, and these had laid themselves out for keeping St. Patrick's

Day in their usual convivial fashion. This the French knew, and arranged their plans accordingly. Stark, however, resolved that the Rangers should keep sober, and declined to serve them with spirits. The Irishmen made themselves excessively drunk, and the French, under Longue, expecting all the troops were alike, suddenly assaulted the fort. They were, however, met by the sober Rangers, and held at bay until the regulars came to their senses and cleared them off. Some months afterwards the fort was captured by the French, and the prisoners were dragged from their ranks and tomahawked in the sight of the French officers.

With the failure of Lord Howe to capture Ticonderoga there began a long string of reverses under General Abercrombie; and until the arrival of Wolfe and Amherst, Montcalm carried all before him. Stark, at the head of two hundred Rangers, was sent on in front by Amherst to clear the road for him in his projected advance into Canada, and during the campaign that followed was constantly employed on scouting duties.

As a sample of the adventures some of the Rangers underwent in these services, the following may be taken. In a bush fight ten of the Rangers were attacked by Redskins. Seven of the Rangers and seventeen of the Indians fell. Of the three surviving white men one escaped, one was captured, and one was massacred and his heart torn out and forced into the captured man's mouth. The Ranger William Moore was carried away to the west to be sacrificed. His body was filled with splinters, and the Redskins were about to set them alight, when the squaw whose son had first laid hands on him, and from whom he had wrenched a tomahawk and buried it in his brains, rushed forward and declared that she would adopt him as her son. By his knowledge of the arts of the whites he gained the affection of the Indians and remained with them six years, until by pretending sickness on account of a bleeding at the mouth, in consequence of running a stick down his throat, he persuaded them to take him to a physician at Montreal, where he regained his liberty.

Or take the experiences of the four who left Crown Point with letters for the Quebec army. The four were Eastman, who ran the Indian gauntlet, Shute, Goodford, and Beverley. Having reached Missisquoi Bay, they started thence for the St. Francis, and proceeded through wet marshy ground, where they could scarcely find a dry spot to encamp. At the St. Francis they made two

rafts of driftwood at some distance above the falls, so that two might first cross, and if they found all right signal to the others to follow with the despatches. Shute and Eastman were selected for the first attempt, but, as they had only poles to push across with, the current proved too strong for them, carried them down, and they had to save themselves by jumping on to a rock just at the head of the falls, against the point of which their raft struck, and stayed long enough for them to save their guns and stores.

After reconnoitring, they signalled all clear to the others, and warned them to try the passage much farther up. The raft was launched as directed, but it too became unmanageable and drifted down with the stream. "Finding that they must go over the falls, they threw down their poles and cried for mercy. Shute and Eastman told them to throw off their clothes and sit down. This they did, and the raft went down the rapids."

From a tree which overlooked the stream Shute and his companion watched their descent as they alternately appeared and disappeared. And then they ran to the foot of the fall and rescued Beverley, who was climbing up the bank, and Goodwin, who was clinging to a piece of driftwood.

Two of the party had thus lost everything, but the others shared what they possessed with them. The men kept on, and one Sunday morning heard the sound of a bell. They made for the sound, and discovered a Catholic chapel, with the villagers crowding in to the service. They waited till all was quiet, and then entered a house and helped themselves to provisions and clothing.

Three or four days afterwards, on ascending a hill, they had their first view of the St. Lawrence, and saw a large encampment on its bank. The troops were the British army proceeding to Montreal, and, accompanying it, they witnessed on September 8, 1760, the surrender of Canada to the British Crown.

Stark, on the breaking out of the War of Independence, was elected colonel of one of the New Hampshire regiments, and took a prominent part in the Battle of Bunker's Hill. He afterwards retired from service, but was again called upon and won the Battle of Bennington over Baum, who had been dispatched by Burgoyne on a very hazardous expedition. And he died at the good old age of ninety-four, the last but one of the American generals of the Revolution.

MODEL YACHTING IN 1884 AND 1885.

(Continued from page 335.)

WITH a passing mention of the Ulster, Derry, and Carrickfergus clubs we cross the Channel, and after a glance at the Saturday afternoon races on Ryde Canoe Lake, hurry on to London. The old Clapham, which has come out with a card for 1885 containing sixteen club matches—to say nothing of specials—had a wonderful season in 1884. Every fixture was successfully brought off; not one had to be postponed. The winning yawls were Ariel, Electric, Phaeton, Wave, and Bustler; the winning cutters Eagle, Griffin, Rover, Maria, and Cynisca. Of the Commodore's prize offered to the yawls who had won a club first during the year Ariel proved the winner; and the Vice-Commodore's prize offered to the cutters who had won a club first during the year fell to Rover, a new boat of great promise. The distribution of the prizes at the annual supper was a new and very pleasing feature of the season.

The Clapham boats practically belong to the tonnage classes, for although the measurement is over all, depth has always held its own against width, and none of the suc-

cessful boats are of less than four beams. The Electric, the newest of the winners, is thirty inches over all; she has a two-inch counter, making her twenty-eight inches on the water-line, and her beam is only six and a quarter. Although the narrowest boat in the club, none of her competitors exceed her in breadth by more than an inch.

The measurement of the Serpentine Club we have already alluded to. During the season ten twenty-tonner matches were brought off, the winners turning up in Wild Rose, Nellie, and Chittywee. In 1885 the club will sail only twenty-tonners built to a seven-eighths scale, and ten-tonners built to the inch. The London is to be challenged, and time difference at so much per pound is to be offered—a pleasant little arrangement which may have interesting results. As showing the extension of model yachting it may be mentioned that it was one of the Serpentine boats that carried off the prize at the model yacht race at Nice.

The Model Yacht Sailing Association sailed a number of matches during the year, the

chief winners being Nellie, Frolic, Brilliant, Rocket, and Minnie. In 1885 we are promised a new class, a yard on the waterline, with a six inch counter. During 1884 the club lost several of its members, some of them to sail under the flag of the London, and one of them, Mr. F. Biddle, having died. Mr. Biddle was a model yachtsman whose recollections went back to the time of the almost legendary Cooper, the gunsmith, who in the year 1833 clapped the first lead keel on the Atalanta, and dealt the death-blow to inside ballast. He was a perfect master of boat-sailing, and was well known in all the London clubs; he was indeed the actual founder of several of them, and his death is a severe blow to his many friends.

The Victoria has also lost its most prominent member during the year. Mr. Walton was a most enthusiastic boatbuilder, and his "How to Build, Rig, and Sail a Self-acting Model Yacht" did much to help on the cause. Although he dealt solely with models of the beamy Victoria build, yet his hints and clear descriptions have enabled many a model

yachtsman to achieve success in boats of the more yachtie tonnage type. One of his last triumphs was the winning of the silver cup with 10 last May. On the same water as the Victoria the Prince of Wales's Club sail their matches, and a silver cup and other prizes were contended for during the year.

There are many matters of interest that suggest themselves in the course of an annual summary such as this. We cannot dwell on them now. One, however, that of the manner of scoring, is of considerable importance. At present it is customary to give the same points to a winner for a beat, a reach, or a run, notwithstanding the well-known fact that the difficulty in designing a model is to get one that will sail to windward. A very

inferior type of boat will do well with the wind aft or on a soldier's wind, but let the breeze once get a point or two forward and she will drop away to leeward like a log. Under these circumstances, some of the clubs are thinking of mending their ways, and to such another extract from the well-thought-out rules of the London, which under the presidency of Sir Thomas Brassey is making such a bold bid for success, may not be unwelcome:—

"In the case of the wind being in a direction to give a beat to windward, and a run, or broad reach over the course, the scoring shall be as follows. The boat arriving first within the winning boundaries after a beat to windward or a close haul, shall count three

to her score; the second boat shall count two to her score. Should the wind give a reach both ways, the first boat shall count two and the second boat shall count one to her score. The first boat in in a run or broad reach shall count two to her score, and the second boat shall count one to her score. At the call of time the prize shall be awarded to the highest score. In case of a tie, where all the competitors have sailed in one division, the prize shall be awarded to the boat that has gained the greatest number of points to windward; and in the event of a further tie it shall be sailed off in a passage to windward, stations for the decision of this tie being drawn for."

(THE END)

GREAT SHIPWRECKS OF THE WORLD.

THE SPIRIT OF THE OCEAN.

The First Albert Medalist.

OUR Albert Medal was founded on March 7th, 1866. The first man to receive the decoration was Samuel Popplestone, of Start

Farm, Devonshire, who at the peril of his life went down the Start Rocks with a rope and saved the survivors of the Spirit of the Ocean.

The Spirit of the Ocean was one of the Nova Scotia packets, and at the time she was wrecked had twenty-four passengers on board, in addition to her crew of eighteen. She left the docks on the 19th of March with a cargo valued at £60,000. Four days afterwards she was caught in a terrific gale, and lost in Start Bay.

The Start is one of the most picturesque headlands that jut into the English Channel. Although it yields in grandeur to the Prawle and the Bolt Head and Tail close by, its graceful outline, rugged rocks aglow with colour, and romantic caves and precipices, washed by the summer sea, form one of those pleasant pictures that never fade from the memory. And when in the winter and early spring the furious billows lash up against it and send the spray showering up in glittering masses, lit for an instant by some fitful ray from between the storm-clouds, the scene is as wild as any on the wild coast of Devon.

Beating through this bay, on her way to shelter at Dartmouth, the Spirit of the Ocean was seen on that stormy Friday afternoon. The sea was running in huge hills, and at every gust of the gale the wave-crests were beaten flat down by the strength of the blast. With most of her canvas torn, and the stray tatters streaming in the wind, the good ship made but slow progress, and drifted bodily towards the shore. She weathered the Pear-tree Rocks, and seemed to be in safety; but in a few minutes the gale seized her, and slowly and surely she was driven to her doom on the Prawles.

She struck at twenty minutes to seven, and before seven o'clock she had been shattered to pieces. She broke in two; the fore part turned over keel upwards, the stern slipped back into the sea, and all the passengers in

the poop were swept away. Of those aft only one man was saved—the mate.

The spot where she had come ashore was at the foot of a precipice about a mile from the lighthouse. The nearest coastguard station was a mile and a half away, the nearest town about twelve miles. The nearest habitation was Start Farmhouse, about half a mile from the cliff.

Fortunately the farmer had seen the ship, and watched her strike. He ran home, procured a long rope, and let himself down the precipice to the rescue. As he touched the rock he was washed off into the sea, but he clung to the rope, and the returning wave brought him back again.

Single-handed, with the rope round him, he worked his utmost to save whom he could

from the wreck. The mate was washed past, and he seized him. Then a sailor was found struggling in the water, then another clinging to the rock, then another.

That was all. Four saved out of forty-two.

The night had closed in, the storm raged on, and the timbers of the lost *Spirit* crashed on to the cliffside to the right and left of the little group clustering round the rope which ran up into the darkness.

Eight o'clock, nine o'clock came, and no help. At ten o'clock—three long hours after the vessel broke up—the rope shook. Help had come, the coastguardsmen had found them at last, and one by one the five men were hauled aloft.

Popplestone took the four men home with

him to his farm and gave them food and shelter. They had had a marvellous escape. The site of the wreck is still pointed out, and a more hopeless spot for succour to reach a shipwrecked man it would be difficult to conceive.

The reason of the disaster was a simple one. The ship was overpowered by the wind and literally blown on to the rocks. Captain Cary was making for the nearest port to wait until the tempest passed by, but before he could reach it the *Spirit of the Ocean* met her doom.

On the 14th of May following the Queen sent for Samuel Popplestone, and with her own hands pinned to his breast the Albert Medal which he had so worthily won.

(THE END.)

Start Bay, Devon.

A HUNGARIAN HOLIDAY.

(See our Coloured Plate.)

IN the south of Hungary and in nearly all the States adjoining the Carpathian Mountains, such as Wallachia and Moldavia, which are now united and form Roumania, the breeding of horses by peasants is very much encouraged, both by the Government

and by leading landowners, who themselves possess extensive studs, which constitute the principal source of their incomes. The peasants are induced to persist in this meritorious and profitable occupation by the distribution of prizes awarded to the successful com-

petitors at the displays which are held periodically under Government supervision, and form national holidays.

It is one of these that Professor Wagner has so cleverly represented. The gatherings are, it will be seen, not only picturesque in

themselves, but are conducted in a way that makes our own system of horse-dealing and horse-racing appear all the more disreputable by contrast. These Hungarian holidays are pleasantly marked by the complete absence of betting, gambling, and all the other grave drawbacks which characterise the English turf, even though the original design even with us may have been solely to encourage the breeds of horses which should be of unrivalled merit.

The Hungarian horses themselves are remarkably good, although rather small. They possess, among other qualifications, great hardihood with considerable sureness and

swiftness of foot. The formidable-looking whips carried by the riders are not used to strike their animals, many of which are great pets, but to add to the hilarity of the scene by flourishing with a series of sharp reports resembling pistol-shots.

The Roumanian Government annually sends out a commission composed of cavalry officers to Hungary for the express purpose of purchasing the very best horses, and they generally attend these national gatherings as the market where they are sure of finding all they want.

To a stranger, especially an Englishman,

these friendly tournaments prove as novel as pleasing. It is pleasant to see these brawny Transylvanians on their bright little steeds, all bedecked with multi-coloured ribbons and gay trappings, and especially to see the care they take of their animals and the proud and almost arrogant way they ride up and down the course or amongst the other peasantry who are assembled to witness the triumph or possible downfall of some favourite horse and rider from their village. All are the owners of the horses they bestride. The people assemble from all parts of the State to witness the scene.

A WATER CYCLE.

HERE is another aquatic velocipede; this time invented and built by a boy. It is now running on the River Huisne, doing

and from these the true shape of the pipes, which are lettered F F, can be made out. The iron is very thin, for the whole apparatus,

Fig. 1.

Fig. 2.

its six miles an hour up stream and its ten miles down.

It consists of two hollow sheet-iron pipes, built in air-tight compartments, and braced together with crossbeams. In Figs. 1 and 2 we give a plan and section of the apparatus,

wheel and all, weighs under eight hundred-weight.

The wheel fitted with paddles, marked R in the illustration, is worked with a chain on exactly the same principle as an ordinary tri-cycle, and the chains are taken fore and aft,

tandem fashion, to the rotary pedals P P. At G G is a pair of rudders connected with a cross-bar so as to work together, and having tiller ropes led up to the driver on the front seat. A wheel-shade (T) and a safety-chain complete the apparatus. The drawings we give are to scale, so that the proportions are exact.

For the iron, waterproof canvas could be substituted, and a pair of bicycle wheels could easily be arranged so as to carry the floats. The new form of water-cycle is thus not so difficult of construction as may at first sight appear, and for those who like to see the way they are going as well as enjoy moderate muscular exercise it may be found a very suitable machine. And it is not an unhandy one, for its rudders take it round the full circle in twice its length.

It was built by Amedée Bollée, a French lad living near Mans, the son of the inventor of one of the recent steam carriages.

We have gone so fully into the matter of these aquatic velocipedes in the parts for April, 1883, and April, 1884, that for further explanation we must refer our readers to the diagrams.

CHESS.

(Continued from page 287.)

Problem No. 93.

By Mrs. SOPHIE SCHETT.

White to play, and mate in four (4) moves.

BERGER'S PROBLEMS.

During the past year of 1884 a second work has been presented to the chess world, entitled "Das Schachproblem und dessen kunstgerechte Darstellung. Ein Leitfadens für Problemfreunde von J. Berger." Thus since Meyer's "Chess Guide" was published in London, February, 1882 (in which, on pages 261 to 263, references will be found to the most important works on chess), we have to thank eight more authors for the publication of their problems. In 1882 the well-known problem collector J. A. Miles published his problems and some of his poems. Then, in 1883, there followed J. Thursby, Miss F. F. Beechey, C. M. Baxter (in English), S. Gold (in German), and E. Pradignat (in French). In 1884 the old master, B. Horwitz, of London, published a volume of end-games, composed by himself and the late J. Kling. The volume by J. Berger contains 124 problems on diagrams in from two to seven moves, and may well be compared with the 101 problems by Kohtz and Kockelkorn, or the 112 problems by Ph. Klett, or the 534 compositions by S. Loyd. Most of the problems by Loyd contain comparatively few variations, and several of them are constructed with a few pieces; but the problems by Klett and by Berger contain many variations and are mostly composed with a great number of pieces. Kohtz and Kockelkorn have a few problems of five or seven pieces, Klett has two of eight pieces, but Berger has always employed from nine to twenty-five pieces. This elaborate style of employing from twenty to twenty-six pieces to produce many variations is not always pleasing, for the difficulty of the solution is not always in harmony with the beauty of the movements. The harmony is mostly and happily preserved in the problems by K. Bayer. The average number of pieces in a problem is fifteen. As we said in our articles in Volume V., page 256, "the height of the art consists in the attainment of much beauty and variety by economical means." Particularly pleasing are Berger's Nos. 2, 12, 36, 53, 55, 85, and 93, also Klett's Nos. 9, 22, 41, 47, 49, 89, 90, and 112, and also Kohtz and Kockelkorn's Nos. 5, 37, 67, 81, 84, 85, 89, and 97. Klett has given fifty-two pages of notes and Berger one hundred and ten pages. The latter has given many appropriate rules and hints, but some of his observations differ from ours. His German, which is difficult, is

made still more so by the superfluous introduction of a number of foreign words. The difficulty of testing the correctness of such problems, both in regard to their solution and construction, is considerable, and but very few have the time or the knowledge for the task.

The following are Berger's No. 2 and No. 85 (his last four-mover):—

White: K—Q Kt 5; Q—Q B 2; Kt—Q Kt 4; P—K B 2.—Black: K—Q 5; Kt—Q Kt 7; Ps—K 4, Q Kt 2 and 3. White mates in two moves.

White: K—Q B sq.; Q—Q Kt 8; R—Q B 3; B—Q B 7; Kt—K B 2; Ps—Q R 3, Q Kt 2, Q B 4, Q 5, K Kt 3 and K R 2.—Black: K—Q 5; R—K R 3; Bs—K R sq. and K R 8; Kts—K Kt 2 and 3; Ps—Q R 3 and 5, Q Kt 6, Q B 4, K B 6 and K Kt 5. White mates in four moves.

When publishing the solutions to these two problems we will call them Nos. 94 and 95.

To Chess Correspondents.

H. M. (Bath.)—Solution and most of the observations correct.

W. H. T.—1, Pf 8: M will not solve No. 85, because the black M can check.

F. T. H. (Scarborough.)—The solution of No. 80, on page 110, will evidently please you. You are willing to play a game by correspondence and require an opponent.

"LA FÉE" (Pentonville).—Inquire about the Chess Club in the Euston Road.—Your problem in two moves will appear, but instead of the black Kt at Q 3 you might have the B at Q sq. to prevent a dual. Your other problem is "lawless."

Frau S. S.—Ihre zwei und zwanzig neuen Aufgaben werden geprüft werden.

To Go-Ban Correspondents.

"NABOG."—When all the twenty-four men have been placed and the game is not decided, then the players move alternately until one succeeds in moving five men in a line. As stated on page 62, a game may have 70 or more moves.

OUR NOTE BOOK.

A VERY NATURAL ANSWER!

The "Educational Times" of December 1st, 1884, remarks: "An examiner at one of our large schools this midsummer gave what he called a 'General Intelligence or Surprise Paper of Questions,' and one of the questions asked in it was, 'What book or books do you like to read best, and why?' The examiner was shocked to find that instead of Scott, or Milton, or Macaulay, nine out of ten named the BOY'S OWN PAPER, and justified their choice by reference to its tales, illustrations, information, and to the way in which it caters for their especial hobbies and juvenile idiosyncrasies." The writer then goes on to observe that the boys and girls of these days are rapacious readers, and in addition to their English Classics they require their own periodical literature, and it is well that they have such a wholesome supply as that furnished by the BOY'S OWN PAPER.

"THE Life of Christianity," said Luther, "consists in possessive pronouns." It is one thing to say "Christ is a Saviour;" it is quite another to say "He is my Saviour and my Lord." The devil can say the first; the true Christian alone can say the second.—J. C. Ryle.

FULLER.—You will find the "Silver Cañon" in the sixth volume. It costs seven shillings and sixpence.

AJAX.—The article on training courier pigeons was in the first volume.

A. S. TAYLOR.—For permission to fish in the New River reservoirs you must apply at the office of the company.

H. R. W.—For silkworms see page 445 in the third volume. Buy the indexes to the volumes; they cost one penny each. You can bind them together.

E. B.—For information regarding the matriculation for London University, write direct to the Registrar, Burlington Gardens, W.

ALPHA.—1. The plate of the Gladiators was the frontispiece to the fourth volume. The packet containing it costs one shilling and eightpence. 2. The child is a native of the country in which it is born. If it is to choose the nationality of its father it must give notice of its intention to do so on attaining its majority. The nationality of the mother has nothing whatever to do with it.

H. M. S. and Others.—There is no obscurity in the new laws. We gave them—in the September part—so that all such difficulties could be settled off-hand.

J. BEERS.—1. The first map of England was made about 1520. The first chart seen here was brought over by Bartholomew Columbus in 1489. 2. The National Debt should be compared with the exports and imports; in other words, the capital invested should be compared with the business done. The debt of the United Kingdom is £21 per head of the population; the business done is £19 15s. per head. The debt of Australia is £33 17s. per head of the population; the exports and imports £36 per head. France has a debt of £26 12s. per head, and only does business to the extent of £9 per head. Her debt is a third as much again as ours, and the interest she has to pay, owing to inferior credit, is nearly double as much as we do. The debts of the British Empire are only £4 6s. per head of its inhabitants, and could be all paid off by eight months' income. Reducing the world's national debts to a five per cent. basis, France would head the list with 780 millions, Russia would come next with 485 millions, Great Britain next with 460 millions, Italy next with 432 millions. Large figures are always startling until you have analysed them. Even a subscription of a halfpenny a head all round would amount to three millions of money.

READER THE LITTLE.—In the typical negro there is a great difference shown. The arm is two inches longer in proportion than that of a Caucasian, and the hands hang level with the kneecaps; the facial angle is 70 as against 83; the brain weighs 35 as against 45; the skull is much thicker; the heel projects backwards; the great toe is feebly prehensile; the frame is not upright; and there is no growth in intelligence once manhood is reached.

UNCLE TOM.—Mrs. Beecher Stowe's "Uncle Tom's Cabin" was first published in 1852.

HONOURS.—Get list of books from Crosby Lockwood and Co., or Spon, and choose for yourself.

A LEARNER.—Read our swimming articles in the first volume.

EAGLE'S NEST.—Why not read a little more? "Doctor S. Hierome" was Saint Jerome. Any biographical dictionary will explain.

P. VARGAS.—See the advertisements on our wrapper. You can obtain fittings from the model dockyards Apply for their catalogues.

A SUFFERER.—You should go to a doctor to be cured, and get him to report the case to the local sanitary authorities. It is simply abominable that public baths should be so used as to spread disease.

SOME DOGGIE FRIENDS.

1.—YOUNG AND SANGUINE!

T. B.—The nest is that of some description of plover. As to a mare's nest, somebody has been fooling you. Why do you not send us one of your six-legged lambs? A bushel or two of green peas and a morsel of mint would form a capital accompaniment. Why don't you learn to spell instead of hunting for mare's-nests. There is only one *i* in "interest," and no *i* at all in "reader."

T. MILTON.—Thanks—many thanks. But we have read enough. Do not trust the valuable MS. to the post. The cost of carriage would be considerable, and the "poem" is so weak in its feet that our readers might not like to see it toddling over forty pages. The opening stanza is sufficient to give you the "fame" you speak of:—

"Tis placid eve, and the circumambulatory moon,
Doth gaze on us like a cherubim in its sphere,
Sir Ralph the Rover says that he will be soon
Amongst his family here."

ARMCHAIR.—Make your own furniture polish. Get an ounce of shellac, an ounce of gum lacnish, and half an ounce of gum dragon, and dissolve them in a pint of naphtha, slowly and carefully, in some warm place, giving them a shake-up once or twice a day, until the solution is complete. Apply by means of a pad of cotton wool.

A YOUNG SALT.—You have by now doubtless discovered that the BOY'S OWN PAPER is on sale in Australia just as here. All the volumes are kept in print, and all the covers for binding are still in stock.

F. G. J.—At most public libraries, free and otherwise, you will find directories to the various counties. Select your county, and look out the name you want in the list, just as you would in the London Directory.

E. C.—The cases for binding the volume will not be large enough to hold the Christmas and Summer parts as well as the ordinary issue. Your best plan would be to save the extra numbers, and have them bound in a volume by themselves.

FITZALLERTON SCROGGS.—In our second volume you will find a long series of articles on Training for Athletic Sports.

HENRY TAYLOR.—A respectful letter to the Governor or Secretary would procure you the latest information as to how to proceed. Always go to headquarters.

T. B. HILL.—The easiest way to make a blowpipe is to buy two or three ounces of glass tubing from the nearest druggist's, and to use as darts large darning needles wrapped round with worsted. If, instead of blowpipes, you were to call them "puff and darts," you would find them on sale at nearly every toyshop, target and all complete. The poisoned darts of the Macoushie are of course not obtainable.

TAXY.—1. A good corrosive sublimate solution is made by dissolving one dram of sublimate in six ounces of spirits of camphor, and then adding two drams of spirits of salt. 2. Richardson's powder for skin-dressing is two ounces of powdered nutgalls, one ounce of powdered camphor, and one ounce of burnt alum. If in a hot climate a couple of drams of arsenic or oxymercurate of mercury are added.

LOCOMOTIVE.—The cardboard engine was described in the parts for December, 1882, and January, 1883.

BONNIE DUNDEE.—We have taken the liberty of quoting from your letter in answering "A Bobbing Swimmer," as you will notice. The best way to clean the pond is to cut the weeds to begin with, and if that has no effect you must run the water off for a time.

N. A. B.—The Albert Hall organ has 7,428 pipes and 111 stops. At Garden City, New York, the Roosevelt organ has 7,031 pipes and 115 stops. At Riga there is an organ with 6,826 pipes and 124 stops.

A BOBBING SWIMMER.—"Could you tell me why my head bobs up and down when I attempt to swim?" Does your head bob alone, or do you bob with it? Perhaps you are light-headed! If you were to make up your mind to keep your head still you would soon do so. Read our articles on swimming. They were in the first volume. Here is an extract concerning them from a letter of the same date as yours: "Seeing your article on swimming in one of your papers, I resolved to put it into practice; so I and my friend went to the pond which is at the bottom of the garden, and after two days we managed to swim."

I. H. D.—Myrrh is the gum of the *Balsamodendron myrrha*, a tree about ten feet high, with thorny branches and light grey bark. It grows in Somali Land, round about Harar.

A VERY JOLLY BOY.—Dissolve some isinglass in water by simmering it over a fire, and strain it through fine muslin. If the size glistens when applied to moderately warm paper it is too thick; if it sinks in it is too thin; it should merely dull the surface. Give your map two or three coats of it when you have got it right, and then varnish with the best mastic.

A BEGINNER.—For oiling cricket-bats use raw linseed-oil. The best plan is to clean the bat with the oil when you return from a match, and use no more than will suffice to get the dirt off. A very few drops are required. If you put on too much the wood will get quite sodden and hard.

R. B. E.—You will find a collection of such formulæ in the "Bijou Calculator," published by Messrs. Warne and Co., price eighteenpence. It is full of tables and calculations for all trades and professions.

INDEX.—The suggestion from an outsider's point of view is a good one, but any one engaged in a printing-office preparing for press can explain to you why it is impracticable.

W. T. HARRISON.—Time is time, and the umpire has power to end the match at the time stated, even if the over were unfinished. This is the law, but the spirit of fairness prevents it being invariably adhered to, and generally speaking the over is finished. An umpire who is so pronounced a partisan should not be allowed to stand again.

I. F. I.—The bookseller could never have inquired. The book is before us as we write. Its title is "Cambridge Scholarships and Examinations, edited by Robert Potts, M.A. London: Longmans, Green, and Co., 1883." It is printed at the University Press, contains over five hundred pages of matter, and gives full particulars of the entrance fees and examinations, and specimens of the papers. It costs five shillings. In all cases of receiving a negative from your bookseller, you should apply direct to the publishers for confirmatory evidence of the book being non-existent or out of print before assuming that you have been misled.

FICTION.—The original of Baron Munchausen was Hieronymus Karl Friedrich von Münchhausen, of Bodenswerder, in Hanover, who served with the Russians and the Turks, and passed through some very extraordinary adventures—not mentioned in the book. He died in 1797. The book was originally written in English, and published at Oxford in 1785; and it was not until five editions had been issued in this country that it was translated into German. Curiously enough, however, it had been written by a German, Raspe, who had fled from Hanover and taken up his residence at Dolcoath Mine in Cornwall.

M. D.—It remains to be proved if chambered mounds were "homes of the world." At present they would seem to be only burying-places. One at Waith, near Stromness, a little north of you, has recently been opened.

J. H.—1. For French polish powder up together an ounce each of gum-mastic, sandarach, seedlac, shellac, and arabic, then add a quarter of an ounce of virgin wax, and dissolve the mixture for twelve hours in a quart of rectified spirits of wine. 2. A good dark varnish is made of sixteen parts of shellac, thirty-two of sandarach, eight of mastic, eight of elemi, four of dragon's blood, sixteen of white turpentine, and one of annatto dissolved in alcohol. Far better buy your polishes and varnishes ready-made from some oil-and-colour shop. They cost very much less, and in nine cases out of ten are very much better. 3. Pictures for zoetropes can be bought at the optician's.

ENQUIRER.—A Queen's Messengership is a purely patronage appointment, and we are unable to help you. Perhaps your friends could obtain the information.

W. M. TUFNELL OAKES.—There are no weekly star charts published. There are several sets of monthly diagrams. Have you seen the "Midnight Sky," price seven shillings and sixpence, published at 56, Paternoster Row?

FUTURIST.—All the volumes have been reprinted, and are now obtainable direct from us or through any bookseller. Vol. 1. costs six shillings, the others cost seven shillings and sixpence each.

F. M. RICHARDSON.—Spend a shilling and buy "Under the Red Ensign." It will answer your queries in full.

EMIGRANT.—1. The largest is Lake Corangamite, with an area of 48,640 acres; the next largest lakeln Victoria is Wellington, with an area of 46,080. Tyrrell has 45,440, Victoria 33,700, and Hindmarsh 35,840. The largest lake in New South Wales is George; it is twenty-five miles long and eight broad. The Great Lake of Tasmania has an area of 28,000 acres. The largest lake in New Zealand is Taupo; it has an area of two hundred square miles. 2. The wonderful prophecy of the future greatness of Australia—"Where Sydney Cove," etc.—was written in 1790 by Dr. Erasmus Darwin:—

"There shall broad streets their stately walls extend,
The circus widen and the crescent bend;
There rayed from cities o'er the cultur'd land,
Shall bright canals and solid roads expand;
There, the proud arch, colossus-like, bestride
Yon glittering streams, and bound the chasing tide;
Embellish villas crown the landscape scene,
Farms wave with gold, and orchards blush between.
There shall tall spires and dome-capt towers ascend,
And piers and quays their many structures blend."
New South Wales was first colonised in 1788.

P. DONAN.—On the American side the Niagara Fall is 164 feet high; on the Canadian side it is about 100 feet. The breadth of the river is 4,750 feet, but this is broken by Goat Island, which occupies 1,000 feet.

F. E. K. ROWBOTTOM.—1. You must get the flasks with the oil in them, or buy them by the dozen from any of the chemical appliance manufacturers, such as Townson and Mercer, Griffin, etc., etc. 2. You can make an electric battery for five shillings. The plates must be as stated. 3. Soak your brushes in raw linseed oil for twenty-four hours, and rinse them out in hot turpentine. You may soften them in hot soda and water and soft soap.

2.—OLD AND CAUTIOUS!

No. 321.—Vol. VII.

SATURDAY, MARCH 7, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

SCHOOL AND THE WORLD: A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,
Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXXVI.

GARLAND took an early opportunity of carrying out his intention of visiting Melhuish.

"I've two secrets on my mind," he thought, "Lang's and Melhuish's. I only hope I may be able to do both fellows a good turn."

Why should he bother himself about Melhuish? you may ask. Melhuish had never been his friend; in fact, at St. Mary's he had treated him badly. But Garland was actuated by higher motives than mere self-interest; that did not enter into his calculations. Melhuish was in trouble; could he help him? That was all that he remembered.

"Now I can face the world again."

He entered the warehouse of the contractor, and inquired after the young man who had brought down the forms to the bazaar.

"Mr. Brown, you mean, sir. What might you want with him? He isn't in."

"I wish you would send him to this address when he's finished his work," said Garland.

"Very well, sir."

Garland returned home. He had given Mr. King's address; that would not raise Melhuish's suspicions. He gave directions for "Brown" to be shown in directly he arrived.

About seven o'clock he heard a ring, and peering through the blinds of the empty study which he occupied in the evenings, saw Melhuish at the door. A minute after he was shown in.

Garland kept himself in the shade till the servant had closed the door, and then rose.

"I'm glad to see you, Melhuish," he said.

Melhuish looked at him in amazement for a moment, but did not take the proffered hand.

"I knew I must get bowled out at last," he said, after a pause. "You've run me down. What are you going to do? Are you going to make me cut away to a fresh place?"

"Not at present," returned Garland.

"I want you to stop here for a time; at all events till we've had a talk."

"All right," said Melhuish, resignedly. "It won't do any good to talk, but fire away if you want to."

"Thanks, I will; but don't stay here longer than you wish to. I thought you might like to meet an old schoolfellow and have a chat over old times. No one in the world except me knows who you are, so you needn't be afraid of being recognised, that is if you wish to keep quiet, which I suppose you do from your changing your name."

"You know why well enough," said Melhuish, calmly. "I stole some money down at St. Mary's and had to cut. I should have been sent to prison, I suppose, or if not my father would have turned me out, so I turned myself out first. Saved trouble, you see."

"I'm quite sure if you were to go back now everything would be forgiven."

Melhuish shook his head. "You don't know my pater," he said, "or you wouldn't talk like that. He's good, but as hard as he can be. No, it's no use talking about my going back; I can't. Besides, I'm all right now. I had an awful time at first, but things have come a bit straight now. I'm getting along now pretty well."

There was a sort of settled misery in his tone which touched Garland deeply. Melhuish seemed to be in despair and a hopeless despair.

"Can't I help you in some way?" asked Garland. "You can't lead a very happy life amongst men who are so different from you in education and taste."

"They're better than I am, most of them. They're not thieves, at any rate."

"Why, you talk as if you were still one," cried Garland.

"It's the same thing," returned Melhuish. "I was a thief once; I can't shake that off, though I've sent back the money. Well, there's one thing about it, I deserve it all. I don't complain."

"Melhuish, I wish you would let me advise you. Write to your father; you

need not give him your address, ask him to advertise a reply if you like. I'm sure he will welcome your return."

"You're not going to tell him you've seen me?" asked Melhuish, quickly.

"No, I shall tell no one without your consent."

Garland saw that unless he promised this the only result would be that Melhuish would again vanish.

"I can't write home. Why should he forgive me? I don't want forgiveness. I deserve it all, I don't complain," he repeated, sadly.

"Can't I do anything for you? Won't you come and see me sometimes?"

"No, thanks, I think it wouldn't be very pleasant for either of us. You can lend me a book or two if you like. I've a little time to myself, and I don't care to go out much alone."

"You are very welcome to any I have," replied Garland. "Look round the shelves and choose as many as you like."

Melhuish rose without thanking him. He picked out three books—Pilgrim's Progress, Dante, and Shakespeare. Garland was astonished at his selection: it showed that Melhuish must have undergone some sort of transformation. At school the trashiest novels were all he cared for.

"I think these will do," he said. "I'll say good-bye now."

Garland resolved to make one more effort.

"I wish you'd do me a favour, Melhuish."

"What is it?" was the listless reply.

"Let me write a line to your father telling him I've seen you and that you are well."

"You mean to split on me after all, I see," was Melhuish's reply, not angrily made, however.

"No, I will not give him your address till you grant me permission. May I write?"

"Yes, if 'twill do you any pleasure. I don't care. I expect he's thrown me over long ago."

"I don't believe it," replied Garland, warmly, though he was ignorant of Mr. Melhuish's letter to Lang.

CHAPTER XXXVII.

A MONTH went swiftly by. Lang worked nobly. Seldom was there so much hanging on the result of an examination. Garland helped him to the utmost of his ability, and once a week they paid a visit to Soady's rooms, and had an hour's relaxation.

Soady was quite a "swell" now, comparatively speaking. At school he had always been careless in his dress, but now he spent a good half hour in dressing, and had serious thoughts of starting shaving.

"Not that there's much to take off just yet," he explained to his friends, "but there's nothing so refreshing as a shave."

He bought a razor and kept it in a high state of polish, but had not yet screwed up his courage to what Tommy told him in a letter was the sticking (plaster) point.

"Seems to me you mean to get on," he said to Lang one day. "You are working now, and no mistake."

"No, I hope there is no mistake this time."

"Seen much of our old friend, Fan-

shawe, lately?" asked Soady, innocently. "By-the-by, did I ever tell you of my little row with him?"

Lang had never heard it, so Soady detailed the affair.

"Wanted to rook me. He's a bad lot, I'm afraid. I should cut him if I were you, Lang. Eh, Garland?"

Garland acquiesced carelessly. He knew better than either that it would not be an easy matter.

The matriculation came at last. Lang obtained a week's holiday, and went down early to the university every day. No need now to go to Kew to hide himself. It was a terribly anxious week to both him and Garland. The latter always came to meet him, and by his encouragement and practical aid did wonders to keep up Lang's spirits.

"It's all over," said Lang, as he left the university after the last day. "There's nothing now but the weary waiting. I'd give a year of my life to know the result."

"I hope you'll do something better with a year than that. I believe you've passed well. The best thing you can do is to believe the same, and try and enjoy yourself for the next week or two. You want a rest."

"Not much chance of enjoying myself with this hanging over my head."

However, he felt relieved of the strain of the last few weeks, and walked home in tolerable spirits. But they sank as he opened a letter waiting for him. It was from Fanshawe.

"DEAR LANG,—I called yesterday, but you were out. You seem to have forgotten you still owe me £2. You promised me £12 instead of £10 in consideration of my waiting for it. I can't wait any longer, however, for I'm in a hole. Please send it to-night without fail. Whilst you are about it you might make it a fiver; I'm really stumped."

Yours ever,

C. FANSHAWE."

Lang read it hurriedly. It was not so very terrible after all. Another fortnight or so and he would, he hoped, have passed his exam., and would be able to cut Fanshawe once and for ever.

He owed him £2, of that there was no doubt. He had a couple of sovereigns left; he could ill spare them, but he sent them by the evening post with a short note:

"DEAR FANSHAWE,—I enclose two pounds, which makes us square. I'm sorry I can't oblige you in the other matter."

Yours faithfully,

A. LANG."

"That ought to be enough to show him I don't want to have any more to do with him," thought Lang. "If I can only stave him off a fortnight more it will be all right; I can sign my articles in spite of him."

His note certainly had the effect of making Fanshawe see that Lang wished to let their acquaintance end.

"Wait a bit, my young friend," he said to himself; "I shall have you in hand pretty soon. Just wait till your articles are signed, and I shall be able to get as much out of you as I like. You won't lend me a couple of pounds? All right,

but in a month's time you'll be glad to give me a fiver to keep my mouth shut."

He was extremely angry. It was irritating to be treated in this way. However, for the present he resolved to keep still and let Lang entangle himself by signing his articles under false pretences.

The days went slowly by. The morning on which the lists were published arrived at last. Lang was on the steps of the university long before the proper time, and Garland soon joined him. They were the first to see the notices, and one of the first names that caught their eye was that of Lang.

"Thank God!" whispered Lang earnestly, seizing Garland's hand and giving it a hearty squeeze. "Now I can face the world again."

"And your conscience too," added Garland.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XXI.—VENETIAN JUSTICE.

DURING the following days Cyprien was busy attending to his experiment. He had introduced several changes in the construction of his furnace, and contrived a better draught. By doing so he hoped to make his second diamond in much less time than he had done the first.

Miss Watkins took great interest in the attempt which she had really originated. Frequently was she seen at the furnace watching through the grating the fire that roared within.

John Watkins was no less interested than his daughter, but from other motives. He wished to become once more the owner of a gem whose value could be reckoned in millions. Great was his fear that the experiment would not succeed a second time, and that chance would fail to play the important part in it that it had done on the previous occasion.

But if the farmer and Miss Watkins encouraged the experimenter to persevere, it was not so with the diggers. Their opinions were the same as those of Pantalacci, Hilton, and Friedel; and the Jew Nathan never ceased in his scheming to excite them against the young engineer. If this manufacture of diamonds was to become a trade—if, like white sapphires, amethysts, topazes, and emeralds made from crystals of alumina coloured by metallic acids, diamonds were to be turned out from the laboratory without trouble—the market value of the stones would tend to diminish. If making diamonds was to become a recognised handicraft, the diamond-fields at the Cape and elsewhere would be ruined.

All this had been said after the first experiment, and now it was repeated with more violence and acrimony. The diggers wished little good to Cyprien or his works. But he thought little of the diggers, and went on his way determined to see his experiment through. He was not going to hang back before public opinion, and had no intention of keeping a secret that might do good to all.

But if he continued his work without fear or hesitation, Miss Watkins, who heard what was going on, began to tremble for him. She reproached herself with having led him on to the track. To trust to the police protecting him was to trust to a broken reed. A murderous stroke is quickly dealt and may fall before any one can intervene. Cyprien might have to atone with his life for the supposed injury he had done to the diggers of South Africa.

Alice grew anxious, and could not hide her anxiety from the engineer. He reassured her as well as he could, and thanked her for the motive that had prompted her to speak. In the interest she took in him he saw the proof of a tenderer sentiment, whose existence was now no secret between them. Cyprien was only too pleased that his experiment led to closer intimacy with Alice, and bravely continued his work.

"What I am doing is for us both," he said to her. But Miss Watkins, noticing what people were saying down at the claims, lived a life of terror.

And not without reason. A regular agitation was organised against Cyprien, and the diggers did not confine themselves to threats and recriminations, but proceeded to do damage.

One evening when Cyprien went off to look at the furnace he found it had been broken down. During Bardik's absence a lot of men had taken advantage of the darkness and in a couple of minutes destroyed what had been the work of days. The bricks had been thrown about, the furnaces had been smashed, the fires put out, and the tools scattered and rendered useless. Nothing was left of what had cost so much thought and trouble. All had to be begun over again if he was the man not to give in to mere brute strength, or he would have to abandon the game.

"No!" he exclaimed. "No, I will not give in! And to-morrow I will give information against the scoundrels who have destroyed my property. We shall see if there is justice in Griqualand."

There was justice, but not of the sort the engineer imagined.

Without saying a word to anybody, without even telling Miss Watkins for fear of adding to her alarm, Cyprien regained his hut, and lay down to sleep resolved to begin legal proceedings in the morning, even if he had to go eventually to the Governor of the Cape.

He had slept perhaps two hours when the noise of his door opening awoke him with a start.

Five men in crape masks, armed with revolvers and rifles and carrying bullseye lanterns, took up their position round the bed.

Cyprien had no idea that anything serious was intended. In fact, he would have laughed had not the pleasantry seemed to him unworthy of such a compliment.

But a heavy hand struck him hard on

the shoulder, and one of the masked men opened a paper he held, and in a gruff voice read as follows:—

"Victor Cyprien,—

"This is to give you notice that the secret tribunal of Vandergaart Kopje, twenty-two members being present, acting in the name of the public safety, have this day at twenty-five minutes past midnight sentenced you to death. You have by a treacherous discovery threatened their interests, their lives, and the lives of their families and of all men who earn their livelihood by the cutting and sale of diamonds. The tribunal in their wisdom have decided that such a discovery deserves annihilation, and that the death of one man is preferable to that of many thousands of his fellows. It has decreed that you shall now have ten minutes to prepare for death, and that you shall choose the manner in which you will die, that your papers shall be burnt with the exception of an open letter you can address to your relatives, and that your hut shall be razed to the ground.

"And thus be it with all traitors!"

As he heard this death warrant Cyprien's confidence began to quail, and he wondered if this curious comedy was one of the savage customs of the country or was really in earnest.

The man who held him by the shoulder soon cleared away his doubts.

"Get up at once," he said gruffly; "we have no time to lose."

"It is a murder!" replied Cyprien, as he rose and began to dress by his bedside.

He was more disgusted than frightened, and concentrated his thoughts on what had happened to him with the coolness with which he would have attacked a mathematical problem. Who were these men? He could not discover even by the sound of their voices. Evidently those amongst them who knew him personally were advisedly silent.

"Have you chosen what death you will die?" asked the masked man.

"I have no choice to make, and I protest against the odious crime of which you wish to be guilty," said Cyprien in a firm voice.

"You can protest, but you will none the less be hanged. Don't you want to write anything?"

"Nothing I would care to trust to assassins like you!"

"Forward, then!" said the chief.

Two men placed themselves on each side of the engineer, and the procession

was formed to pass through the doorway.

But as the advance began something very unexpected happened. Into the middle of the secret commissioners of Vandergaart Kopje a man rushed with a bound.

It was Mataki.

The young Kaffir, who often prowled round the camp after dark, had noticed the masked men, and followed them. He had heard all that passed, had understood the danger that threatened his master, and suddenly leapt in, scattered the diggers right and left, and threw himself at Cyprien's feet.

"Why do these men want to kill you, pa?" asked he, clasping his master's legs, while the masked men in vain endeavoured to tear him away.

"Because I made an artificial diamond," answered Cyprien, clasping Mataki's hands to prevent his being torn away from him.

"Oh, pa! I am so sorry for the harm I have done!" said the Kaffir, bursting into tears.

"What?" asked Cyprien.

"Yes, I will confess everything now they want to kill you!" said Mataki. "Yes; they ought to kill me, not you, for I put the big diamond in the cannon!"

tube!" said Mataki, struggling. "Yes; I swindled you, pa! I thought you would like to think that your experiment had come off!"

His protestations were so fierce in their energy that the masked men stopped to listen to them.

"Is that true?" asked Cyprien, surprised and disappointed at what he heard.

"Yes! a hundred times yes! I speak the truth!"

And then the men released him, and he sat on the ground and spoke as follows.

"The day of the landslip, when I was buried by the fall, I found the big diamond! I was holding it in my hand and wondering how I was to hide it when the wall fell on me to punish me for my wicked thought. When I came back to life I found the stone in the bed you had put me in. I was going to give it you, but I was ashamed to confess that I was a thief, and I waited for a favourable opportunity. Not long afterwards pa wanted to make a diamond, and set me to look after the fire. The second day, while I was there alone, the gun burst, and the furnace was all broken. Then I thought that pa would be sorry because his experiment had failed; and I squeezed a handful of clay round the big diamond

waited and said nothing, and when pa found the diamond he was very glad."

A burst of laughter that the five men could not restrain saluted these last words of Mataki.

Cyprien did not laugh; he bit his lips in vexation.

It was impossible to mistake the Kaffir's story; it was obviously too true. In vain Cyprien sought for some reason for his telling a falsehood. In vain he said to himself, "A diamond exposed to such a temperature would have been volatilised!"

His sound sense showed him at once that, protected in its envelope of clay, the gem had escaped the heat, or been only partially affected by it. Perhaps, even, it was the torrefaction that had given it its sable tint. Perhaps it had been volatilised and recrystallised in its shell!

These thoughts crowded into his brain and associated themselves with extraordinary rapidity. He was stupefied.

"I remember seeing the piece of earth in the Kaffir's hand on the day of the landslip," said one of the men when the laughter had somewhat subsided; "and he clutched it so tight in his fingers that we couldn't get it out."

"There is no doubt now," said another. "Is it possible to make a diamond? We must have been mad to think so! As well try to make a star!"

And they began to laugh again.

Assuredly Cyprien suffered more from their mirth than their menaces.

After consulting together in a whisper, the leader said to him, "We are of opinion that the execution of the sentence passed on you, Victor Cyprien, may be respite. You are free! But remember that the sentence always hangs on you! One word—one sign, even—to the police and you shall die! Your very good health!" and, followed by his companions, he disappeared through the doorway.

The room was left in darkness. Cyprien might have imagined he had been the prey of a nightmare. But the sobs of Mataki, who lay stretched on the ground, and wept noisily with his head between his hands, proclaimed the reality of what he had passed through.

It was cruelly true! He had escaped from death, but at the cost of a deep humiliation. He, a mining engineer, a pupil of the Polytechnique, a distinguished chemist, and well-known geologist, had been taken in by a miserable Kaffir!

Or rather it was his own vanity, his ridiculous presumption, that had led him to this unheard-of blunder. He had even thought out a theory accounting for his discovery! What could be more ridiculous?

"My paper!" he exclaimed. "Have the brutes taken it away with them?"

He lighted a candle. No! His memoir was there. No one had seen it. He could not rest until he had burnt it.

Mataki's grief was so intense that he endeavoured to comfort him. This was not very difficult. At the first kind words of his "pa" he seemed to live again. And Cyprien assured him of his forgiveness on condition that he left off such tricks for ever.

Mataki promised by all that was sacred that he would do so, and Cyprien went to bed.

In the morning when it became known that the Star of the Settlement was

"A regular agitation was organised."

"Take this fellow away!" said the leader of the gang.

"I put it—I put the diamond in the

and slipped it into the cracked gun; and I made the furnace all right again, so that pa could not see it had broken. I

neither more nor less than a natural diamond, that the diamond had been found by the young Kaffir, who was quite conversant with its value, all the suspicion against him was again awakened. Watkins made a tremendous noise. Matakiki must be the thief! After having thought of stealing it once, it was evident that he had stolen it on the night of the dinner.

Cyprien protested, and offered to guarantee the Kaffir's innocence, but no one would listen to him. And this showed him how well founded had been Matakiki's fear of returning to Griqualand.

But the young engineer had no idea of giving in, and so brought forward an argument which to his mind sufficiently cleared the Kaffir.

"I believe in his innocence," said he to John Watkins; "and, besides, if he was guilty, it is my business, and no one else's. Natural or artificial the diamond belonged to me before I gave it to Miss Alice—"

"Oh, it belonged to you, did it?" said Watkins, with a sneer.

"Certainly," said Cyprien. "Was it not found on my claim by Matakiki, who was in my service?"

"Nothing could be more correct," answered the farmer, "and consequently it belonged to me by the terms of our agreement, which gave me the three first stones which turned up."

Cyprien gazed in astonishment. It was true, and he said nothing.

"My claim is just, I believe?" asked John Watkins.

"Quite just," answered Cyprien.

"I shall be very much obliged to you then if you will say so in writing in case we come across the diamond which some scoundrel has so impudently stolen."

Cyprien seized a sheet of blank paper, and wrote,

"I beg to state that the diamond found on my claim by a Kaffir in my service is under the terms of my agreement the property of Mr. John Stapleton Watkins. "VICTOR CYPRIEN."

And with this vanished all the dreams of our youthful engineer. If the diamond ever did appear it belonged of right to Watkins, and a new abyss that many millions could not fill had opened between Alice and him.

And if the farmer's claim was disastrous to these two it was none the less so to Matakiki. The diamond had been stolen

all that Cyprien could say or do for him.

He would escape if he would restore

"Five men in crape masks."

from John Watkins, and John Watkins was not the man to abandon the chase when he thought the thief was in his power.

And so Matakiki was arrested, imprisoned, and in twelve hours had been sentenced to be hanged in spite of

the Star of the Settlement. But he could not restore it, for he had never taken it. And Cyprien did not know what to do to save the unfortunate man, in whose innocence he was obstinate enough still to believe.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy-Earl," etc.

CHAPTER XII.—(continued.)

ARRIVED at his destination, Kakaroff ascended to the upper hall, where he was relieved of his cloak by a servant, who was astonished at the disordered condition of his master's uniform, the torn and draggled appearance of his epaulets, and sundry bruises and scratches on his face.

"Is her excellency at home?"

"She is, your high excellency."

Kakaroff wrote a few words in pencil on a card, which he gave to another servant to deliver to her directly.

"Now, Abrazoff, go with this man to the library, where Popoff will soon join

you. You must both wait for me there." Then, turning to another servant out of livery, he said, "Go prepare my bath; and tell Vassilie to have another uniform like this ready at once. He must be quick!"

He followed the first servant up the staircase which led to the upper rooms, where we lose sight of him for the present.

The next arrival was the carriage, with its guards, in which Palitzki was seated. This drove into the yard and stopped at the door of a side building or wing of the palace. Here officials were in wait-

ing to receive the new-comer, who was ushered into a large and splendidly-furnished room, the windows of which were secured outside by iron bars set into the brickwork in both directions, parallel with the length and with the breadth of the window. This prison-like arrangement was not evident at first sight within, for there were heavy silk curtains at the sides of the windows, the centre portions of which were concealed by lace curtains, blinds, and half-curtains. As if the darkness in the room had been produced by its situation in a courtyard, one of the gas chande-

liers hanging from the ceiling had all its lamps lighted, so that the glittering gilt furniture and the pictures on the walls stood out well from the darkness; and, in fact, a brighter, more comfortable, and more cheerful room could not well be imagined. Beyond this room was another, elegantly furnished as a dining-room. The paper-hangings on the wall were of a light-drab colour, the sideboard and other furniture were of light oak. The lamps were all lighted, and the blinds were pulled down.

Palitzki and the officer entered this room together. The latter, remarking on the comfort of the arrangements, said, "But the best way to test the comfort of a dining-room is to have something to satisfy another sense than sight. What shall I order for you in the way of refreshments? His excellency will not be long absent, and I think you had better take something."

"No, thank you," said Palitzki; "I had rather wait; but I should be glad if you could show me into a place where I could enjoy a good wash, and put my dress to rights."

The officer now led the way through the rooms to a dressing-room and bathroom attached. The student noticed that the arrangement of the whole suite, though very handsome, was such as to preclude all chance of escape. It was, in fact, a gilded cage. He made no observation aloud to his guide, who now left him to his toilet, an example which we shall follow, and turn our attention to Popoff and his colonel.

They had just arrived, and their drosky was driving off. They stood for a moment admiring the beautiful animals which were harnessed to it. As they were intently watching their graceful action a closed carriage drove up, which also was drawn by two horses of the same breed and colour and general appearance as the splendid pair which had brought them. The servant on the box jumped down, a lady's face looked out at the window, the colonel eyed the boy sharply, who started in surprise, and asked his guide brusquely, "Does she live here?"

The officer replied with another question, "Why do you ask?"

"It is very important for Ivan Petrovitch to know that this lady is here. Pray tell me, does she live here or not?"

"Not generally, I believe; but have you not seen her to-day before this?"

"Not to-day, but I have seen her before. Pray take me to Ivan Petrovitch."

The officer led the boy off in the direction of the private cabinet of the prefect of the police, while the lady, who had descended the carriage steps, was shown upstairs into the red-and-gold drawing-room of the palace. Here she was requested to take a seat, and was then left alone. Greatly agitated by the events of the day, Annie flung herself into a chair and wept bitterly, so bitterly that she did not notice the entrance of a lady in a black velvet dress with a very long train.

She was very pale, very tall and stately, of a presence quite fitted to those princely rooms. She stood a moment looking at Annie, and then sitting down on the settee beside her, flung her arm round her waist and exclaimed, in very sweet, soothing tones, "Duschinka moya! why do you cry?" To be called "Duschinka

moya" (my darling) at that time, when she stood so much in need of sympathy, was an immense comfort to the agitated girl. She rested her head on the woman's shoulder, and sobbed as if her heart would break. After a time she grew calmer, and at last was so far recovered as to be led away to the dressing-room of Anna Feodorovna Kakarova (feminine form of Kakaroff).

Meanwhile Kakaroff had, as the sailors say, "repaired damages;" and so fresh and well did he look when he came from his bath and dressing-room, carefully and faultlessly dressed, from the cut of his hair to the shape of his boot, that no one save the valet would have guessed that there was any *patching* in his case. But not a trace was discernible of the late struggle for life or death.

He entered Palitzki's rooms and said, in a very hearty, straightforward manner, "I owe you an immense debt of gratitude for settling the fellow in the cellar just as he was troublesome, but I have a difficult task in arranging your affair. The worst of it is that you have committed yourself so deeply by writing, that it is difficult to know how to act. That is silly."

"You see I was very much in earnest."

"Bah! You had no business in that trouble at all."

"A change must come, and those who effect it will one day be looked upon either as the regenerators of their country or martyrs."

"Fiddlesticks! I have not come here to talk politics; I want to know the whole story of your connection with little Ivan and Metrofan Dmitrievitch."

"That is easily told. I was recommended to teach the imp Latin, but of course I had more important things to attend to—"

"Than your duty," interrupted the police-master.

"Well!" continued Palitzki, "I wrote a letter, as you know, for my division, which was discovered by Smirnoff, whom it was decided by the council of the division to destroy, and admission having been gained to the house in Zakolniki, a dynamite bomb was attached to the door of his letter-drawers, though of course my paper had been removed. The bomb was of the Saaltzfeld construction, and was discharged, not by a clockwork contrivance, but by a simple hammer arranged to fall when the door was opened. When you went to see Smirnoff we were all in high hopes that it would finish both of you."

"You are too polite," said Kakaroff; "I am greatly beholden to you—quite as much so as though you really had been successful."

Palitzki continued: "I found very soon that I was not a free agent, that I was watched absurdly, and after two personal conflicts with Hermann I was doomed to perpetual confinement. By constant worrying at the lock of my door I contrived to weaken it, so that at last when I gave it a furious wrench it yielded, and the door flew open. The delight of paying off Hermann was immense, and it was that, and no desire to aid you, which procured your deliverance."

"You are too polite; I am most obliged."

"It has done me some good, however," continued Palitzki; "it has convinced me that the would-be liberators are much worse people than those whom they seek

to destroy, and under their rule we should be tyrannised over, whereas we are now only governed."

"I am glad to hear you say so. I had rather owe my life to a loyal man than to a Nihilist. I am afraid that the unpleasant nature of your connection with these people has got into a certain *section* of our service, in which case I shall not be able to do much for you, although I shall do my best. The worst of it is that the president of the section is very highly incensed against you, and has resolved to make an example. It would be a pity, if you are really sorry for what is past, that you should suffer—apart from my debt to you. I must think what is to be done."

So saying, he turned on his heel and left the chamber.

We must now pause for a moment, and follow the flight of Kakaroff's telegram to Kursk.

The prefect of the good city of Kursk was, in his way, as important a man as Kakaroff. Still, the prestige of the name of the Moscow magnate, being one of the aides-de-camp of the Emperor, was considerably greater than that of any of the other police-masters; so that courtesy impelled him at once to reply to the telegram, saying that no effort should be wanting for the apprehension of the boy.

Shortly after the dispatch of this telegram Colonel Masloff was announced and received. He bore in his hand the telegram from Kakaroff, and had come to ask leave of his superior to devote his time and energies to the pursuit.

"My dear colonel," said the police-master, "I am much obliged by your willingness to assist me and my excellent friend General Kakaroff. Pray take whatever time and what men you want. Kakaroff seems to have known what he was about in pitching upon you to find the urchin. There has already been a reward offered."

"Yes, that is only a thousand roubles; but as it was offered some time back, it will be increased now, of course."

Masloff at once set to work to find out all that he could about the "mystery," and discovered that the coachman from Steinfeldt's factory (now dismissed for rather too much fondness for "schnapps") thought he had found a clue to the elucidation of the whole. We have already mentioned this worthy as driving Frau von Steinfeldt and Annie from the Kursk terminus. He now said that he had had his suspicions aroused; he was careful to look into the circumstance, which he thought strange, of the mysterious visit of Annie one night, and her sudden departure next morning with a very uncommon young lady. A crony of his had remarked Steinfeldt's arrival with a young lady at Volkhova, and his return alone. Then servants at the monastery spoke to friends who visited them from Kursk of the effect of monastic discipline on the youthful mind, and how a wild little urchin had been left by Steinfeldt in charge of the Igun, and how he had become quite a pattern of docility. This was retailed at Kursk and was soon known to the authorities. So in putting two and two together they came to the conclusion that the boy at Kupsk was the girl at Steinfeldt's, and the girl at Steinfeldt's was the boy from Moscow! This very clear and lucid conclusion arrived at, the next step on the part of

the police was to dispatch a party of gendarmes to the monastery, with what result we already know.

As soon as Colonel Masloff had his interesting charge in his possession he telegraphed to Kakaroff, "Boy found; coming on to Moscow at once. Boy safe and sound."

Ivan was lodged in the dwelling of the police-master at Kursk and treated sumptuously, and was, after all, glad enough of the change, more especially as he was allowed to ride about with a gendarme officer until Colonel Masloff's official duties at Kursk were wound up and he was able to start with our hero. Nor was he less happy when, after the lapse of two days, he, in company with the equally happy Colonel Masloff, found himself in a first-class carriage, steaming along at full speed. Then he said to the colonel,

"Colonel, did you ever travel in petticoats?"

"Certainly not. What an extraordinary question!"

"Well, I have," said our hero, "and I can't get over the disgust I felt. It always comes over me; I can't help it." And throwing himself suddenly on his back on the seat, he flung his feet up in the air, to the great horror of the somewhat stately officer.

At the grand station, instead of having the dinner sent into their coupé, the colonel took Ivan with him into the grand salon, and there gave him such a dinner as astonished both—Ivan to have it set before him, and the colonel to see him eat!

Arrived in Moscow the colonel drove at once to the Hôtel Dussaux, where he took rooms for himself and Ivan, taking care that as soon as possible the boy should have a Russian bath and be properly attired to visit General Kakaroff. Thus the evening of their arrival was spent in these details, which, though trifling in

themselves, are so important in many phases of life.

This the colonel knew as well as anybody, and when he was dressed the next morning to present himself to the general he was something for an artist to contemplate. His full-dress green tunic was well made and of the best. The ornamentations due to his rank were bright as bright silver lace could make them. His epaulets were miracles of size, grandeur, and brilliancy. His medals and orders looked new, his plume was glossy and flowing, his gloves of the purest white. His boots looked as if they had never been worn before. His hair was oiled, his mustachios fresh dyed, and altogether such a military dandy had seldom left Dussaux's. The carriage of the establishment was sent for, and the police colonel and his protégé were soon at the door of the police-master.

(To be continued.)

A SCHOOLBOY'S ADVENTURE WITH MOONLIGHTERS.

By JAMES COX, R.N.,

Author of "Fascinated by a Fakir," "How I Saved My Aunt's Diamonds," etc.

CHAPTER III.

REGGY was only speaking the truth when he said that Castle Kilrea was a wee bit gloomy. In fact, the residence of Colonel Fitzgerald, although styled a castle, bore no resemblance to the structure one usually associates with that description of building. It was a large square edifice totally devoid of any architectural beauty, standing alone on a rising ground. In front of the house there was a lawn overgrown with weeds, bounded by a low stone wall, on the other side of which was a plantation of firs that extended for nearly a mile in the direction of the shores of Lough Corrib.

The hall door was situated at the side of the building, and was approached by a winding avenue from the highway. At the back of the house was a kitchen garden and shrubbery, and a road through the latter led to the stables and coach-house. In a room over the stables was the residence of Mickey Doolan, the coachman; and of late the policeman detailed for the protection of Colonel Fitzgerald had shared Mickey's quarters.

Beyond the garden there was a small copple, and in the fields that stretched away to the rear were the miserable hovels of the small farmers and tenants. Then came a wild stretch of uncultivated land, sloping up the side of a range of rugged mountains that shut out farther view.

Notwithstanding the fact that Reggy found the West of Ireland not quite so cheerful as he had anticipated, he was happy enough; and what with the pleasant society of Eileen and her brother, gallops' cross country, wild-fowl shooting on the lough, and occasional trips to the town of Galway in company with the colonel, whose magisterial duties frequently called him there, he found the time passing rapidly away, and as Christmas Day drew near he began to think there must be many worse places than the Emerald Isle.

A week before Christmas Day Colonel Fitzgerald received two letters.

It was a fine frosty morning. He had just come down to breakfast when Mickey entered the room with the post-bag and delivered the missives to his master. One was a blue official envelope, the other a dirty envelope with a black border. As the colonel broke the seal of the latter envelope and glanced at the contents, an uneasy look flashed across his features for a moment, and he hastily crumpled up the letter and placed it in his pocket.

"What have you got there, papa?" asked Eileen, noticing the expression of her father's face.

"What is that to you, Miss Curiosity?" replied her father, breaking the seal of the other, and after perusing it, throwing it across the table to his daughter.

"Ah! what is this?" exclaimed Eileen, looking at the big sheet of foolscap. "Oh, papa, you don't mean you are to go to Dublin at once?"

"Yes, darling, so it appears; you see what that letter says."

"What a shame, father; but you'll be back by Christmas Eve, dear, won't you?"

"Oh, yes, no doubt; it's only to give evidence at the trial of that rascal Mahoney, who was arrested for setting fire to Peter Cassidy's farm."

"Gracious me, Fitzgerald," shrieked the aunt, "don't tell me that you are going to leave us here alone for a week! Wretched boy!" glaring at Charley, "what are you laughing at?"

"Oh," said the colonel, with a smile, "you'll be perfectly safe, depend upon it. The two boys, with Mickey and Dan, will take good care of you. What do you say, Eileen?"

"I'm not a bit afraid, papa."

Immediately after breakfast the colonel packed up his traps and drove to town to catch the mail-train. Before leaving he impressed upon Charley the necessity of seeing that the house was carefully locked up at night, and gave directions that during his absence Mickey should sleep in the castle, as the policeman would not be on the premises.

Directly the colonel left, Miss O'Dowd worked herself up into a frantic state of excitement, and insisted on Charley, Reggy, Eileen, and Dan accompanying her on a tour of inspection.

"Before I'm an hour older I'll see that every bolt and bar in this dreadful place is in good order. Now, Dan, bring the keys of the cellar; we'll commence there."

And a nice dance the old lady led them. She was evidently well acquainted with every hole and corner in the castle. Not a fastening escaped her sharp eyes—upstairs and downstairs she trotted, and presently arriving at the colonel's study, she sat down in her brother's arm-chair, and with an air of satisfaction turned to Reggy, and with a grim smile said,

"I think I've finished for the present. Charley, just look at the fastening of those shutters; are they all right?"

"All right, aunty."

"Very well; now I shall go to my own room. Wait a moment, though; let me see if the chain is on the hall door."

She walked nimbly towards the end of the hall, with the intention of examining the chain, when a piece of crumpled newspaper attracted her attention near the door-mat.

"Mercy on us, what is this?" shrieked the lady, as she unfolded what looked like a letter written on black-edged newspaper.

"Whatever is the matter, aunty?" exclaimed Eileen.

"Matter!" groaned her aunt, thrusting the paper into the hand of her niece. "Look at it!"

"Why, that's the letter papa received this morning. He must have dropped it when he went away."

"Murder! murder!" shouted the old lady. "Quick, Dan! get the blunderbuss! Dear me! dear me! Why did I leave Dublin?"

"What's all the row about?" asked Master Charley, looking over Eileen's shoulder.

"Oh, Charley," said Eileen, "look!"

She held out to him the letter, and he read the following lines scrawled beneath a rude sketch of a coffin:

"Just what I expected! Just what I expected! Didn't I tell you, boy," said Miss O'Dowd, glaring at Reginald, "that we were surrounded by assassins and villains of all descriptions?"

There was a loud knock at the door.

"Oh!" shrieked the old lady, "here they are!" And she rushed wildly upstairs to her room, calling out as she fled, "Don't open the door—don't open it."

"Poor aunty, how dreadfully frightened she is," said Eileen, tenderly. "Dan, open the door, there can be no danger at this time of day."

Dan did as his young mistress ordered, and admitted Mickey.

"Hallo, Mick! what's up?" said Charley.

"Oh, nothin', yer honour; sure I've

jest seen the colonel off, and he tould me to tell the young mistress he'd be after telegraffin from Dooblin when she might expect him home again."

"Mick," said Eileen, "did my father tell you that you were to sleep in the castle while he was away?"

"Faith, an' he did, miss. Wasn't he after tellin' me to take care of ye all? an' sure, miss, ye know that Mickey 'ud die before any harm should happen to yer swate self."

After this eloquent speech Mickey marched off to feed the horses, and the two boys endeavoured to persuade Eileen that Colonel Fitzgerald would be sure to take every precaution for his own safety.

Notwithstanding that her brother and Reginald made light of the threat contained in Captain Moonlight's letter, the girl felt very anxious for her father, and Miss O'Dowd did her best to increase the anxiety. That highly nervous personage refused to leave her room except to make a tour twice a day round the house to examine the locks, and on these excursions she now insisted on being escorted by Dan and Mick with loaded guns.

The day before Christmas Day arrived, and no telegram had been received as yet from Colonel Fitzgerald; but Eileen and the boys, in anticipation of his return, were busily engaged all the morning decorating the dining-room with holly and evergreens. After luncheon Charley suggested to Reggy that they should go down to the lough and see if they could get a shot at some wild duck; so, taking

their guns, they started off, intending to return home by sunset.

Soon after leaving the castle a rising bank of clouds betokened a change of weather.

"Shouldn't wonder if we had a snow-storm to-night," said Charley; "I hope we shall; I always like to see the snow on Christmas Day."

The boys had now reached the shores of the lough, and Charley, finding his skiff in its usual place, fastened by a rope to a large stone just above high-water, jumped in, followed by his chum, and pulled away to the middle of the lake.

"Too early, I think, to see any ducks," remarked Charley. "Suppose we pull up against the tide, and drop down just before dark to that island over there?"

"All right."

"There's a hut on that island; Mick and I built it the year before last. If we have time I'll show it to you. I used to go there pretty often, once. I liked to fancy myself a second Robinson Crusoe, and Mick was my man Friday. The only drawback was, we had no cannibals to look after."

While the lads pulled up the lough, resting now and then to scan the shores sharply for birds, the time slipped rapidly away.

"It's just three o'clock," remarked Charley, looking at his watch. "Back water, old man, and I'll pull her head round; we may get one shot under the lee of my island."

(To be continued.)

THAT BELL!

BY PAUL BLAKE,

Author of "School and the World," "The New Boy," etc.

perate activity when awake. He seemed

to lay in a fresh stock of energy every time he had a nap, and although the most difficult boy in the school to waken, when he was awake he was irrepressible.

It was winter. Berry found that season of the year did not agree with his constitution.

"This getting up in the middle of the night is killing me," he remarked one day to a group of sympathisers. He had the whole school on his side in this particular matter, for work before breakfast in winter was decidedly unpopular. At half-past seven every boy had to be at his desk, "putting in" an hour at mathematics before prayers and breakfast.

It was pitch dark at seven, when the big bell rang as a signal to rise. It is curious how difficult it was to hear that bell in winter. Berry never heard it, or rather never heeded it. He scorned to rise till twenty minutes past seven. He could "do it," as he termed dressing, in ten minutes, and had been known to do it in five. On such occasions his personal ablutions were apt to be rather neglected.

"That old bell is at the bottom of it," remarked Culverwell, another boy, who found that the heavy clang disturbed his slumbers.

"It's John who's at the bottom of the bell," put in Millward.

"I wish he'd resign," said Berry. "It's time they pensioned him off and sent him to a hospital for incurables."

"He's a hopeless job," said Millward.

"I spent half an hour one day trying to make him understand that I was willing to stand him a shilling if he'd give us a few minutes' grace in the morning. But he's as deaf as a post, and though he took my shilling he rang us up more punctually than ever next morning."

"I wish he'd hang himself with his bell-rope," said Culverwell.

They eyed the offending bell, which hung idly in its turret, built over what was once a stable, but was now part of the school buildings.

"I wish we could muffle the old thing," said Millward, looking wistfully up. "It's freezing hard, and 'twill be deadly work getting up to-morrow."

"I believe I could shy a stone up and crack it," suggested Millward.

Berry had been silently inspecting the building.

"Tell you what, you fellows," he said at last, "I believe I could get up there if I had a ladder. Out of the small classroom window, jump on to the ledge, then creep up the roof by the chimney, then a ladder over the space to the turret. If you fellows will hand me up the ladder I'll go!"

They were all dumb for a moment at his audacity. Then Millward said,

"How are you going to get into the small class-room? It's always locked in play-time."

"So 'tis," assented Culverwell.

"Then I must get up to the ledge with a ladder, and then pull it up after me."

"You're a plucky beggar!" exclaimed Millward, in admiration. "Shouldn't we have a jolly snooze in the morning if you could stop that old bell's jaw!"

"I will, too," said Berry. "There must be a ladder somewhere about."

"There's the one John uses to clean the outside of the windows," suggested Millward, "but it isn't long enough."

"It may do," said Berry. "Come along, let's get hold of it. This is just the time; it's dark, and 'tisn't tea-time for half an hour."

It was just five o'clock, and nearly every boy was indoors; few cared for sliding on a worn slide in the dark, and a game was out of the question. So the

three boys had small fear of being discovered as they prowled about in search of John's ladder.

That worthy was having his tea, and was not likely to be disturbed by any noise, for he was stone deaf. The boys hauled out his ladder almost from under his nose without his hearing a sound. Culverwell kept "cave," whilst Millward held the ladder for Berry to ascend.

It was a plucky if not perilous feat to attempt in the dark. But Berry was abounding in pluck, and the spirit of the adventure made him keep his nerve. He soon found himself on the ledge, and managed to haul up the ladder after him. It was an assistance instead of an incumbrance in crossing the roof, and he soon was within a dozen feet of the turret.

The boys below anxiously waited for his reappearance. But he had a job before him. His idea was to unship the tongue of the bell. He had a glorious reward if he could succeed, for *John would never know if the bell rang or not!*

It would be superb to have the old facetotum pulling away at his rope and fancying he was fulfilling his duty when the tongueless bell was swinging silently on its pivot.

Berry worked the tongue this way and that, but it was a difficult job. The inside of the bell was as dark as the inside of a wolf, to use a hunter's simile; he had to feel everything. And the metal was terribly cold.

However, at last he managed to unhitch it. He deliberated what to do with it now he had it. He put it in his

That Bell!

pocket, and descended as quickly as was consistent with security.

"Off with the ladder," was his first order.

They soon had that in its place again. Then they felt safe from detection.

"What are you going to do with it?" asked Millward, alluding to the rusty tongue which Berry exhibited.

"I think I shall leave it at the bottom of the turret. If I take it away they'll know some one's been up, but if we leave it here they'll think it's dropped down."

"Let's hope they will," said Culverwell, dubiously.

"At any rate I'll chance it," continued Berry. "So you fellows will be able to have a tall time to-morrow morning; we shan't get called till past eight at the earliest."

The sequel proved the correctness of Berry's prophecy. Old John sought his bell-rope punctually at seven as usual, rang away steadily for three minutes, and then retired to his den to commence his never-ending job of boot-cleaning. One or two boys woke from sheer habit, but hearing no bell went to sleep again. The rest slumbered peacefully on, little thinking to whom they owed their unwanted repose.

The whole household were asleep. The big bell was the signal for rising to every one, servants included, with the exception of John and his wife. Her duty was to light the schoolroom fires, after which she retired to her own part of the house to prepare her husband's breakfast. These two almost useless pensioners on the doctor's bounty inhabited two rooms apart from the rest of the house.

How long every one would have slept cannot be known, perhaps till nine, for when one depends on a bell for waking one waits for the accustomed sound. But dogs are not like human beings, and Fido, who always had his breakfast at eight, began making a great disturbance at a quarter past.

Fido woke his mistress, the doctor's wife. She looked at her watch—8.15. She was surprised beyond measure, as there was a strange silence everywhere. But the clock on the mantelpiece confirmed her watch, and two minutes later bells were ringing in a manner which brought the servants out of their beds with a jump.

By half-past eight every one, boys and all, had been awakened, informally, for the bell refused to make a sound. John

was summoned, and was at last made to understand what was the matter. He asseverated warmly that he had rung the bell, and went on a tour of inspection. He found the tongue on the ground, and obtaining a ladder from the gardener next door, fastened it in its place again before it was time to ring for school.

"Never had such a gorgeous sleep in my life," said Millward, warmly, to Berry. "We'll vote you a silver tankard as a reward of merit."

"Pity the trick can't be played twice," remarked Culverwell. "They don't seem to suspect anything this time, but if it were to happen again there'd be an inquisition."

Berry heaved a regretful sigh. It was hard to think that at seven next morning the inexorable bell would toll out as usual the knell of departing night.

Something that day put him in a peculiarly reckless mood. More than that, he did not get his usual afternoon nap; he was disturbed by an inconsiderate master, who wanted to know when certain lines were going to be handed in to him. So five o'clock found Berry ready for any deed requiring more cheek than usual.

The bell! It struck him directly after he had written his last line. Whatever might happen he would have one good long sleep more.

He did not confide his intentions this time to his two friends. He knew his way now. In five minutes he had captured the ladder and placed it against the wall.

He was just stepping off it on to the ledge when he heard footsteps beneath him, perilously near. If he attempted to draw up the ladder the noise must attract attention. His only chance was to keep quite still, in the hope that the ladder wouldn't be noticed in the dark.

But it was. Old John happened to have finished his tea earlier than usual, and was on his way to fetch an armful of wood.

"Now, who's been taking my ladder?" he said to himself. "Suppose it's one of them boys wanting to get their balls off the ledge."

He put the ladder on his shoulder and marched off with it.

Berry listened in horror. He did not know it was John who had captured his only means of retreat; whoever it was, he must throw himself on his mercy.

"Hi!" he called out, in a voice meant to combine a shout and a whisper.

There was no response.

"Hi! you there!"

It was a shout this time, and no mistake. But it had no effect.

Berry knew now it must be John. It was no use to shout. He tore off a piece of plaster and shied it in the direction of the retreating figure.

It struck the ground close to John, but he did not hear it. Poor Berry was left alone on the ledge, fourteen feet from the ground.

He couldn't drop, for there was a nasty grating just beneath him; besides, he could not lower himself from the narrow ledge. He might have done it in daylight, but not in darkness. Even his pluck must draw the line somewhere.

It was an uninviting night, and not a boy was out of doors. There was nothing for it but to accept the inevitable, and remain where he was till something happened.

He knew well enough what would happen. After tea there would be calling over; he would be unable to say "Adsum," and inquiry would be made, resulting in his capture and punishment.

Once more he proved himself a true prophet. Everything fell out exactly as he had anticipated. And by the time he was assisted down he was so cramped and frozen he would have welcomed a caning on the spot to warm him.

Intentionally or unintentionally, the authorities did not connect his being on the ledge with the outrage on the bell of the day before. He received the usual punishment for missing calling over, but beyond that nothing was done.

Probably the master who captured him considered he had already suffered punishment enough. At any rate, Berry was of opinion that he had bought his extra hour's sleep rather dearly.

OUR PRINCES OF WALES.

It is seldom that congratulation is so cordial and representative as it was at the recent coming of age of the eldest son of our Prince of Wales. His Royal Highness may well be proud of the general expression of goodwill that greeted his attainment of man's estate. It is a happy augury for the future. He has a popularity of the sort that lasts, due to himself, due to his parents, and due in no slight degree to his manner of education.

He was born on January 8, 1864. He was named Albert after his grandfather, Victor after his grandmother, Christian after his maternal grandfather, and Edward after the Queen's father, Edward Duke of Kent. Officially, as the "Court Circular" has it, he is Prince Albert Victor; popularly, it would seem, he is best known as Prince Edward;

legally he is Prince Albert, for a man's Christian name is his only name in the strict eyes of the law.

The English are proud of their navy and quick to perceive the advantages that accrue from travel and discipline. It was therefore with much satisfaction that the announcement was received of the entry of the princes as cadets on the Britannia. They passed through the usual course, and two years afterwards went to sea in H.M.S. Bacchante and visited the West Indies. In 1880 the Flying Squadron, under the Earl of Clanwilliam, consisting of the Inconstant, Bacchante, Tourmaline, Carysfort, and Cleopatra, started on its famous cruise. The princes thus had an opportunity of seeing Spain, Madeira, Bahia, Montevideo, and the

Falklands. They went to the Cape of Good Hope and to Australia. Thence they sailed to Fiji and Japan and China, and came home through the Suez Canal, visiting the Holy Land and Greece on their way. In their cruises in the Bacchante they had thus had the opportunity of seeing every British colony except Canada and New Zealand.

Their subsequent careers are familiar to most of us. Prince Albert Victor left the sea for Cambridge; Prince George, having chosen it as his future profession, is still afloat. It was while the princes were in Australia that they took so much interest in Mr. Faurey's "Evangelist" canoe, as related in our account of its cruise; and it was from Australia that we of the BOY'S OWN PAPER received the honour of being permitted to

dedicate our fourth volume to "Their Royal Highnesses Prince Albert Victor and Prince George of Wales," of whom we had previously published portraits in colours.

And now perhaps a few words on the princes of the past may not be uninteresting. The first Prince of Wales was the Edward who was beaten by Bruce at Bannockburn. This may not be the most complimentary way of alluding to him, but it affords the easiest means of his identification. It effectually disposes of the popular error that the first Prince was the Black Prince.

Edward of Carnarvon, then, was the first on the roll. How many successors has he had? The number is variously given as from twelve upwards, and as it depends very much on opinion, the best plan would seem to be to include all who at any time bore the title. Reckoning in this way, our present Prince is the twentieth of his name.

There is a prevalent notion that a Prince of Wales becomes so by birth; there is another that he has always been the sovereign's eldest son. Both notions are erroneous. The Prince of Wales is not born to the dignity. He is "created" as a commoner is created a peer. He has not always been the monarch's eldest son. The first Prince of Wales was not only not the king's eldest son, he was not even the king's eldest surviving son. It may be news to some of us that England once had a chance of having a King Alphonso.

Before we proceed with our roll of princes we will say a few words with regard to another subject, opinions on which seem also to be rather cloudy. We are told in some of our school-books that the Prince of Wales's feathers, and the motto, "Ich Dien," were taken from the King of Bohemia by the Black Prince at Cressy. It may be so. At the same time it is curious, first, that that king's crest was the outspread wings of a vulture; secondly, that ostrich feathers are unknown in Bohemian heraldry before or since; and, thirdly, that neither then—nor afterwards, for that matter—did the Bohemians speak German!

To say nothing of the Nine Muses having their three feathers apiece, nor of the plume of the Mogul Emperors and the Zulu chiefs, we have the ostrich feathers as the badge of our own King Stephen, the motto being *Vi nulla invertitur ordo*, "No force alters their fashion;" we have the feathers borne by every one of the sons of Edward III.; we have two feathers only as the badge of the Prince of Wales in 1370, and it is not until the days of Henry VII. that we have the plume finally adopted as the distinctive crest of England's only legal Prince! In the Black Prince's will he directs that his motto be put over his arms at Canterbury; but the motto is not "Ich dien"—it is "Houmout." In the only case on record of the Prince having signed his name—in the Angouleme warrant—he has written in a duck's-egg flourish "Houmout ich dien," which can be translated as "Valour I serve." It is therefore not unlikely that the "Houmout" in his will is the abbreviation of the full motto, and that the "Ich dien" was retained as being similar in sound to the motto of the first Prince, the "Ich dyne"—"Your prince," which the Welsh antiquaries have all along contended it should be.

It seems that Edward Longshanks, the greatest of his name, was at Rhuddlan Castle when he was informed of the birth of his son at Carnarvon. The Carnarvon Castle, it may be as well to mention, was not that now standing, the masonry of which is of subsequent date to King Edward. The Welsh had averred they would never accept a prince who spoke the hated English tongue. The king hurried to Carnarvon, called the notables of the principality together, presented them the baby with "Ich dyne"—"Your prince," and assured them with a grim smile that the new-born prince could speak no word of English!

Edward at this time had had three sons. Two of them had died, and the third, Alphonso, was very weak and delicate. After a time Alphonso, to the great grief of his father and of the nation, with whom he was a favourite, died, and Edward became his father's hope. We read of his education, of the primers that were bought for him, of his sports and playthings, and as he grew older of the very questionable pursuits in which he indulged. In short, as boy and man, there have been very many nobler characters than Edward of Carnarvon.

He was formally granted the principality of Wales in 1301. Previous to that he had been banished the Court for six months for his riotous conduct, and three years subsequent to it he had been sent to prison for breaking into the Bishop of Chester's park and destroying the deer. After Edward had made his famous vow to "God and the two swans" to subdue Scotland, the Prince of Wales went to the borders and harried the country so that even his father reproved him.

Soon afterwards the son was in disgrace again. The king was so angry that he jumped at the Prince, and "tore handfuls of hair out of his head!" In July the "Mal-leus" died, and the first Prince of Wales became king. His career had begun badly; it was to end badly. Notwithstanding his father's liberality, he owed at his accession a sum equal to nearly half a million of our present money!

His son was Edward III., who was never called or created Prince of Wales. In his father's lifetime he was simply Earl of Chester. The second Prince was thus Edward of Woodstock, the "Black Prince," who was born on 15th June, 1339, when his father was only eighteen years old. The companionship that existed between Edward III. and his son is easily accounted for when this slight difference of age is considered.

Prince Edward was the first duke ever created in England, his father having bestowed on him the duchy of Cornwall on March 17, 1337. Six years afterwards, on the 12th of May, 1343, when he was thirteen years old, he was created Prince of Wales. He was thus the second Prince of Wales and the first Duke of Cornwall.

The Black Prince was a favourite from his infancy. So fair a picture did his mother make when nursing him that Philippa of Hainault, Queen of England, and Edward of Woodstock, her son, were taken as models by the artists of the period, and do duty on their canvases for Madonna and Child! He was educated in every accomplishment, and in his sixteenth year went with his father to France. The expedition landed at La Hogue, famous in after days as the scene of one of our greatest naval victories, and the Prince of Wales was knighted on the cliffs above the town. Cressy followed, and the lad of sixteen bore the honours of the day. The French were four to one, but the victory remained with the invaders.

Three years afterwards came the sea fight off Rye, when the Prince destroyed the Spanish fleet. Then came the daring expedition into the south of France. King John swept down in force to raise the siege of Romorantin. He talked of terms and ransom. The Prince replied, "England shall never have to pay a ransom for my bones." Poitiers was fought, the French routed, and their boastful king taken prisoner and brought to London.

Edward married Joan the Fair Maid of Kent. The Earl of Kent, her father, was the youngest son of Edward I., and had been sentenced to death by Isabella "the she-wolf," and the "gentle" Mortimer. Not an Englishman could be found to execute him, and the earl remained placidly sitting on the scaffold till five o'clock in the afternoon before a man could be got to behead him. The man was a prisoner in the Marshalsea, who was given his life on condition that he killed the earl.

Joan wished to marry the Earl of Salisbury, and was betrothed to him. She was, however, married by Sir Thomas Holland, and had several children. When thirty-three years old she was left a widow, and three months afterwards became the wife of the Black Prince, who was then thirty-one. The happy couple lived near where the Monument now is, on Fish Street Hill!

After his visit to Guienne, during which he won the battle of Najera, defeating Du Guesclin and Enrique and placing Pedro on the throne of Castile, the Black Prince returned to England to die. His eldest son was not Richard, but Edward of Angouleme, who died when he was seven years old. The Black Prince died on 8th June, 1376, soon after he had held his own "Good Parliament." Richard of Bordeaux, his second and eldest surviving son, was created Prince of Wales five months afterwards. He was our third prince, but as Richard II. was not very satisfactory as a monarch, we will pass on to the fourth who bore the title.

This was Henry of Monmouth, the madcap, afterwards Henry V. He was born on the 9th of August, 1387, and was created Prince of Wales on the 15th of October, 1399. Though, chiefly on Shakespeare's authority, he is known as "the madcap prince," it is remarkable that there are no contemporary accounts of his escapades, that all his escapades are identical with those related of Edward of Carnarvon, that nothing in Prince Hal's subsequent career showed that he had led a dissolute early life, that Edward from start to finish was consistently vicious, while if Henry of Monmouth did reform, his reform was the most violent on record, and gives us the only case in history of a sower of wild oats reaping a crop of honest grain.

He was wounded at Shrewsbury, fought in 1403, and two years afterwards won the battle of Glosmouth. When in London he lived at "Coldharbour, in Eastcheap," not far from the Black Prince's house, near the present Metropolitan Station. He was a great friend of Sir John Oldcastle, otherwise Lord Cobham, the Lollard. He was the victor of Agincourt, and the most popular Henry that ever wore a crown.

We are now getting into troublous times. The fifth Prince of Wales was Edward of Westminster, the son of Henry VI. and Margaret of Anjou. He was born on October 13, 1453, and created Prince of Wales on the 15th of March, 1454. This is the Prince whose adventures have been told over and over again in so many books for boys. He was killed at the battle of Tewkesbury, or rather disappeared about that date.

The sixth Prince of Wales was Edward of the Sanctuary, who was the son of Edward IV. and Elizabeth Woodville, born on the 14th of November, 1470, created Prince of Wales on the 26th of the following June, and known in English history as the Edward V. who was never seen to leave the Tower, and is said to have been murdered by Richard III.

The seventh Prince was Richard Duke of York, ordered to be addressed as Prince of Wales on the 31st of October, 1460, and killed on the 31st of December following at the battle of Wakefield. He is generally omitted from the list of the Princes, but if he is to be dropped out Charles II. must go too, for Charles was no more created Prince than Richard was, and so we retain them both.

The eighth Prince was Edward of Middleham, the son of Richard III. and Lady Anne Neville, who was born in 1474 and created Prince of Wales in 1483. He died in 1484, much to the grief of his father, the "Crook-back," whom some commend for his broad shoulders, the "weak intriguer" who slashed into the centre of Tudor's chivalry at Bosworth, and, humpback or no humpback, managed to cut down with one sweep of his sword the most powerful man in England. For the current notions of Richard as well as for those of Prince Hal the Elizabethan dramatists are mainly responsible. And just

as Henry V. is the most inconsistent of scapegraces, so Richard III. is the most inconsistent of cripples!

The ninth Prince was Arthur, the son of Henry VII., who was born on the 20th of September, 1486, and created Prince of Wales on the 7th of December, 1489. He was the first husband of Katharine of Aragon, and died, four months after his marriage with her, in 1502. Henry VII. having proposed to marry the young widow himself and been refused by her mother Isabella, a match was arranged with his eldest surviving son, Henry. This Henry, born in 1491, and created Prince of Wales in 1503, was afterwards Henry VIII. He was the tenth Prince on the list.

Who was the eleventh? We need not dwell on Henry's matrimonial arrangements. The king wished Mary to be Princess of Wales, then Elizabeth was to be Princess of Wales, then Edward was to be Prince of Wales. Nevertheless, no proper steps were taken in the matter, and it is agreed on all hands to regard Edward VI. as never having been Prince. For the eleventh we have thus to wait for the Stuarts, and he appears in Henry Stuart, the son of James I., born on the 19th of February, 1594, and created Prince of Wales on the 10th of June, 1610. He was a lad of great promise, the friend of Walter Raleigh and Phineas Pett, the constructor of the navy, who made for him the first model yacht on record. Prince Henry went bathing at Richmond one night after a heavy supper, and died a few hours afterwards, aged eighteen, 6th of November, 1612.

The next Prince, the twelfth, was Henry's brother Charles, who was born in November, 1600, and created Prince of Wales in 1616, four years after Henry's death. In all cases these intervals are worthy of note as being so entirely opposed to the popular contention as to the haste displayed in the creation of princes. Charles and Buckingham, as "Mr. John Smith" and "Mr. Thomas Smith," started off to the Continent in search of a wife. The expedition was a failure. Most of Charles's expeditions were failures; and we need not dwell on them.

Who was the thirteenth Prince? Charles II.; and yet Charles was never created Prince of Wales—at least, his patent is not forthcoming. He was born in 1630; "a baby so ugly that I am ashamed of him," wrote his mother in giving the news of her confinement. Verily Henrietta Maria was the most candid of mammas.

For the fourteenth we must take the Old Pretender. He, like his uncle, was never created Prince of Wales, but was formally addressed as such in his father's reign. For the fifteenth we take the Young Pretender, who was never created such, but was occasionally so addressed by the Jacobites. It is only on the principle of "including all who were so called" that we here notice him.

The sons of Queen Anne were none of them Princes of Wales. The sixteenth Prince became in after years George II. When George I. landed to succeed Queen Anne he was already a grandfather, and his son was

created Prince of Wales a few days after he came ashore at Greenwich. The battle of Oudenarde is famous as having been that in which "two Princes of Wales took part." One was the Pretender, the other was George. In either case, however, the description is very far-fetched.

The seventeenth Prince of Wales was Frederick Lewis, the son of George II., who was born in 1707, and created Prince in 1729. In 1736 Frederick married Augusta of Saxe-Gotha, the young bride of seventeen, who insisted on bringing her doll with her. Frederick died in his father's lifetime; and the eighteenth Prince, born in 1738 and created in 1751, a month after his father's death, was afterwards George III. The nineteenth Prince was George IV., born August 12th, 1762, created Prince of Wales on August 17th. The twentieth Prince of Wales is our own Albert Edward, born on November 9th, 1841, whose creation dates from December 8th in the same year.

Having no record of the patents, we can, if it seems good to us, reject Richard Duke of York, Charles II., and the Pretenders from our full list, and look upon the present Prince as only the sixteenth entitled to the name. He is made out to be the fourteenth by confusing Edward II. with the Black Prince, and omitting Edward of Middleham, and he becomes the twelfth by taking no count of Arthur Tudor and Henry Stuart. We have, however, given all we can find who have borne the title, and our readers can assign his numerical position for themselves.

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE NISERO.

Camp of the Captives on Sandy Island.

The two boats on the port side were unapproachable, owing to the ship having listed that way. The surf had begun on them its work of destruction. In less than an hour both were total wrecks. At first the starboard lifeboat, thanks to defective gearing and the ship's heavy list, could not be moved, and the smaller boat on the bridge was hoisted into the sea. Another attempt succeeded

The Graves of the seven who died.

NE of the best-known of recent wrecks is that of the Nisero. This is owing, first of all, to the political complications to which at one time the disaster threatened to give rise; and secondly, to the remarkable narrative of the sufferings of the crew, compiled from the diary of one of the survivors, which has recently been published by Messrs. Sampson Low and Co.

There is nothing specially interesting about the wreck itself. The Nisero was an iron screw steamer of 1818 tons, belonging to Messrs. Pinkney and Sons. She left Liverpool on June 12th, 1883, and after running aground in the Red Sea, made her way to

Penang, served under charter for a short time, and then started for home. On November 8th, about midnight, when steering for Acheen Head to replenish her stock of coals, she ran ashore on the western coast of Sumatra, about a hundred miles south of that point. All attempts to float her off having failed, the hands set to work to launch the boats.

The Armourer.

Drawn for the BOY'S OWN PAPER by H. J. Walker.

in clearing the larger boat, and by using a mattress as a fender she was safely launched. In the boats the crew rowed to the shore; all told, with captain and officers, they numbered twenty-eight.

They had scarcely landed when a couple of natives were espied in the distance cautiously approaching along the beach. They came within about seventy or eighty yards, counted the men, and disappeared into the forest. A

few minutes afterwards they returned, accompanied by others, and then, creeping up very carefully, proceeded to search the newcomers for arms. The Chinese cook happened to speak Malay, and, acting as inter-

preter, informed the Sumatrans that they had to deal with an English crew, and not a Dutch one. With the Dutch the islanders were then at war, so that the distinction was important.

The natives retired, and by-and-by returned with a fruit-offering as a token of

The Pongah Chief.

peace or goodwill. The shipwrecked men were then invited down to the village of Pongah, close by, and soon afterwards they went. The chief of Pongah, Yapatee, seemed to be a well-intentioned fellow, and anxious to help, but in the morning his superior, the Rajah of Tenom, arrived. He immediately saw an opportunity of making money by way of ransom, and after some delay marched the men off as prisoners.

He took them to Tenom by the most round-about route he could find—through the heart of the jungle and across a long, deep, miry swamp, in many places deep enough to be dangerous to life. Places had to be crossed on single spars about three or four inches in diameter, and these not fixed at either end, so as to shift and shiver when walked upon. At one place a spar gave way, and the second engineer fell into the mire. The prisoners saw a small crocodile on the banks of a creek they had to ford, and soon afterwards came upon a large turtle almost buried in the sand. The natives, by means of tree-branches inserted underneath her, robbed her of some eggs, to which proceeding she showed her objection by violently beating her breast against the ground, evidently with the intention of smashing the eggs they wished to take from her.

Having reached Tenom, a village of about sixteen or eighteen huts, they saw the village youths despatch a snake about six feet long. One of the youngsters had ascended a coconut-tree, and discovered the victim in another tree close by. On passing the word to those below a general shout arose, and sticks and stones were soon flying up around the snake on all sides. At last a piece of wood brought it down, and then a little fellow stepped forward and cut the head clean off with his sword—for in those parts the juveniles, as soon as they can walk, are armed with sword and dagger.

A day after the snake-hunt a couple of strangers arrived in the guise of pedlars, and, on getting the villagers pretty well occupied examining their wares, one of them slipped a note into the hand of a Nisero man standing near. It was addressed to the captain, and came from the Dutchmen on the coast, cautioning him to be very patient and discreet, as he was in the hands of a barbarian who was quite capable of killing off every prisoner in his power.

On November 24th the captives were moved off to Upper Tenom, and here they met a certain Tuku Yet, the rajah's chief adviser, who afterwards conducted the negotiations for their release. From Upper Tenom the captain, cook, and second engineer effected their escape. They were sent off to the Dutch

gunboat to arrange the terms of ransom, and did not return, although they failed to arrive at an agreement.

Meanwhile the detention of the shipwrecked crew had produced a good deal of interest among the men-of-war on the coast, and the Dutch had threatened to bombard the rajah's village unless the captives were released. The bombardment took place, and the Nisero's men were hurried to the country out of the way. From where they were they could distinctly hear the whirring noise of the shells as they sped through the air; and the discharges of the guns and the explosions were so loud and decided that it seemed as though the men were on the scene of action. The next day the bombardment began again, the ships covering the landing of troops, and the troops using their muskets when they reached the beach. In the middle of the uproar one of the rajah's kranis, or officers, arrived in the camp and unceremoniously marched the prisoners off into the interior. They were hurried through the jungle, away from all chance of rescue.

The British then took the matter up, and a series of lengthy negotiations began, which resulted eventually in the party being set free. An attempt at escape on the part of two of the men is thus narrated in the book:

"On the morning of February 19th a fireman and sailor set out after breakfast, without saying a word to any of us. The fireman carried a fishing-rod and line with him, and we thought the men had only gone as far as the swamps, no great distance from our hut, where we occasionally resorted to our simple fishing-gear to pass away an hour or two, though we seldom caught anything. Shortly after the departure of the two a few more went to try their luck at the pools. On returning they were surprised not to find the others, as they had seen no trace of them. It immediately struck us how matters stood, the two missing men having been noticed in deep conversation up to a late hour the previous night.

"The next day closed without any signs of our two men. We certainly did not attach any blame to them for trying to effect an escape; but we censured them for the underhand manner in which they went off, especially when the project was discussed mention had been made to the effect that if any one succeeded in getting out safely a signal should be made by three guns being fired in quick succession. Their leaving in the manner they did left a doubt as to whether they had heard the arrangement talked over.

"Between three and four o'clock on the Thursday afternoon we were rather surprised at the reappearance of our two wanderers, accompanied by a native. We feared there was something amiss on seeing them issue from the wood. The native, followed closely by the fireman, came out first; the other man, being some distance in the rear, was a couple of minutes coming into sight, and this made us imagine all sorts of disasters. Both men were in an awful condition; they were torn and bleeding from head to foot, and their clothing, torn off their backs, had been plastered all over with mud and mire.

"It appeared that they had come across the native, who was perched at the top of a very high tree, not very far from our camp, although they themselves did not know they were so near. They informed us that they had succeeded in getting down far enough to sight Upper Tenom on Tuesday night. Here they lay down, intending to remain till morning, but the violence of the storm which set in prevented them from doing so, and they were compelled to keep in motion through being wringing wet. On morning breaking they were afraid to proceed farther as they were beginning to feel the effects of hunger. All day Wednesday they were engaged in returning, and were close to our camp that night, but could not hit the right path. In spite of their miserable condition they lay down, completely tired out, and on waking

next morning were so stiff and sore as to be unable to proceed farther until some of the stiffness was got rid of by working their limbs about before starting.

"While endeavouring to find the right road they espied the native aloft, and hailed him, but that individual hesitated before coming down. He, however, subsequently did so, and by signs and motions they made their wants known. All this time they had been fasting, having had nothing but a small piece of sugar-cane procured the first day. Strange to say, the native did not appear to have any suspicion of their real intentions, and accepted the statement that they had lost their road returning from fishing."

After several moves from place to place the crew, on March 22nd, took up their quarters on Sandy Island, near Upper Tenom, and here seven of them died and were buried. On April 26th they experienced a storm unequalled in the memory of any amongst them—and one of them had been over thirty years at sea. It struck the stoutest with awe. The atmosphere was a mass of flickering flame, and the thunder, but a couple of hundred yards overhead, was terrific in its intensity. The rain fell as if the heavens had opened to part with their very last drop. Even the natives, used to such displays—for Sumatra is an awful place for thunderstorms—were in a state of consternation. During the raging of the elements they threw themselves heart and soul into their devotions, and these were loud enough to be heard between the peals of thunder.

Shortly afterwards three of the party made their escape, but they were eventually recaptured. In July the rajah made an attack on the third engineer, cutting him to the ground with the back of an axe, and the complications threatened to become serious. However, the terms of ransom were eventually arranged, and in September the seventeen survivors were allowed to embark on board H.M.S. Pegasus in return for a nice little consideration of forty thousand dollars. The record of their life in the island, with all its trifling annoyances and petty vexations, forms one of the most popular books of adventure lately issued from the press.

DOINGS FOR THE MONTH.

THE POULTRY RUN.—The boy who is not busy in this month—the first in spring by the old way of reckoning—will have but little luck at all throughout the year. And this opening sentence of ours applies as well to boys in other fancies as to those of the poultry run. Be ready for anything and everything, then. We have no doubt but that your fowl-house and run, and everything connected therewith, are in tip-top order. Do not forget your diary or notebook. There will now be many items to jot down therein. Have once more a look around everything. Do so in the morning; you will then be freshest, and things will catch your eye that in the latter part of the day might escape your observation. If any wire-work wants repairing do so immediately. It is a good plan to have a few yards of meshwork lying in some dry place, ready for all emergencies.

Have the roof of your fowl-house well secured against leakage. "March goes out like a lion," the almanack says; a nail in time may save your roof entirely. Be careful about the cleanliness of your run this month; it may be wet and sloppy, and you will not get eggs if your fowls suffer from exposure. Could the floor of your yard be improved? Could it be made any drier? Ask yourself these questions, and answer them. See that your shelter-shed is also weatherproof. Renew the earth in your dust-bath. We have before recommended dry peat earth. We wonder if any boys in Wales or Scotland have taken to this kind of bath for their fowls. The peat earth is a capital disinfectant, but you can improve it by scattering a few good handfuls of sulphur in it.

Eggs ought now to be very plentiful; but do not forget, please, that a supply of these genuine dainties depends on the way you feed. Here is the "wrinkle" for March: Feed according to the state of the weather, letting what you give the fowls be more stimulating (*i.e.*, meat scraps and bullock's lights boiled, etc.) when the weather is cold. But laying fowls must have exercise. They pick up a deal of morsels that increases the laying power and the building-up of the eggs. Besides, exercise keeps them employed, and happy; for, strange as it may sound to some ears, fowls that are lonely, miserable, and confined in empty runs, never did do well as layers. If, therefore, your run is small, throw every day garden refuse, grass, and stuff into it, and scatter among it a handful or two of barley.

Be careful to feed chickens often and well, and feed all the different members of your feathered flock according to their needs and requirements, being sure that nothing is overlooked. They might be divided into five classes—(1) Cockerels or young cocks, often too gallant or shy, or something, to help themselves; (2) ordinary laying hens, greedy to a degree sometimes, and cruel to (3) the half-grown chickens; (4) the sitting hens, who require hard food, a warm nest, and quiet corner; and (5) young chickens, that eat about their own bulk every day. These last are greatly aided in their growth by milk.

Have any of our boys ever tried keeping ducks? We believe that some who live in the country would be more successful with these than even with fowls. We ourselves favour the Aylesbury and Rouens. They weigh at two months about four and a half pounds if they have been well fed and seen to. We cannot help adding, try them. Get good eggs, and put them under a Dorking hen.

THE PIGEON LOFT.—It will be time enough this year—if we are any judges of the weather—to mate pigeons about the end of March. It is all very fine to boast about early-hatched birds, but we are convinced that mating too soon is neither good for parents nor offspring. If you want something to do in the beginning of the month, why, there is the loft itself to be seen to. But we cannot tell you everything in these short monthly essays of ours, so we earnestly advise you to adopt hints from breeders whenever you can. Go and see other pigeon-lofts, and always have your eyes skinned, as sailors say, and on the outlook for improvements.

See, then, that your loft is perfect, draught-proof, but well ventilated, mice-proof also. Did you ever hear of a cat brought up in the pigeon-house or loft? We have, and they do very well. But we much prefer lofts where mice cannot enter. Never be prevailed upon to put down poison to mice anywhere about a place where other animals—cats, or dogs, or fowls—live. If you find a mouse's hole, mix up a paste of grease and cayenne pepper, dip a rag in it, and plug the hole. Mice do not care for cayenne; one bite at such a plug makes their eyes water, and they never take another.

We have frequently told you how to mate. Let the pair see each other for a day or two, and see none else; when they play up, it is a sign they will mate. Of course, your pairs must be young; and the more strong, vigorous, and lively they are the greater will be your chances of success.

Feed well on wholesome food; give clean water daily. Beware of a damp, sloppy floor, and see that the sun peeps in occasionally, for darkness breeds or helps to breed disease.

THE AVIARY.—This is the mating month among canaries as well as pigeons; and if the weather be fine about the middle of March you may think about turning your birds in. But do not be in too great a hurry. Do not believe that summer has come when you see a blink of sunshine. Pairing too early is a mistake that is often fatal to the offspring and to the birds themselves. So beware.

Continue to feed well, and cover up the cages at

night if there be the slightest chance of frost; or, indeed, to make safe, do so whether or not. Get ready all conveniences for the coming season; and if you can spare money to buy a good book on canary-breeding, do so. The money will not be thrown away. Have another look over your breeding-cages, and if there is any suspicion of their not being perfectly clean, re-cleanse them; for if you once get vermin among your breeding-birds you will do little if any good this year.

As we said last year, we much approve of the German system of breeding canaries; the offspring are sure to be bold and saucy, and therefore healthy.

THE RABBITRY.—We must once more warn our readers against what we can only call the sin of keeping rabbits in close, confined hutches, among dirt or foul air, and feeding them on anything or anyhow. We happen to know that many boys keep rabbits simply for their own pleasure—that is, for the pleasure of possessing something alive with fur on it that will run and hop about and amuse them. Have a rabbit if you choose for a pet, but do in mercy's name learn to feed it. Know that rabbits will not feed and thrive on any kind of greens, grass, and damp roots; that they must have corn or grain, and hay, and that they must have light, and clean, dry bedding, and all the room possible.

We hope these few lines will not be thrown away upon our readers.

THE KENNEL.—The days are getting finer, and Tip or Rover dearly loves a scamper in the fresh air, especially if there be a blink or two of sunshine about. We always advise dogs as boys' pets. They are not only wise, but they actually teach and tell their owners that they are possessed of powers of mind that are of a very high order. Every thinking boy is benefited by having as a companion a trusty dog. Then, how a dog loves his young master! Surely no boy could forgive himself if he were neglectful of so faithful and loving a comrade, and did not feed him well and regularly, and give him water, exercise, and a clean dry bed to lie on at night, well protected from the cold and rain!

DOMESTIC PETS.—It is a curious thing that a boy never thinks of having a pig as a pet. You are surprised to hear us speak so? But you would be still more surprised if you knew the wonderful sagacity and aptitude to be taught there is in a pig, if allowed to have its freedom. It will require hardly any food it cannot find for itself, but should have a trough and a warm bed in an outhouse. It will follow like a dog, and is a most amusing creature. The only drawback is that you have sooner or later to part with piggie—when piggie becomes pork. A fox puppy makes a darling pet, and becomes quite as tame, and even more amusing, than a dog. The pup should be got from a keeper when very young, and kept in the house with the cat, but taken out every day for exercise.

THE KITCHEN GARDEN.—Now is the time to begin work in earnest. For all kinds of seeds and potatoes can be put down now, as soon as the ground is dry enough. You will manure well, and turn the ground, and when dry, rake it. Take care to have your beds neatly planned, and very level and nice; and do not forget that all vegetable seeds, even *lettuces*—though this may be new to some—are best sown in drills.

THE FLOWER GARDEN.—See to beds, borders, and walks. Go in for beauty everywhere. Prune and trim wherever such work is required. And do not hesitate to plant all kinds of spring flowers, bulbous excepted; and if you are going to transplant, lift a flower with a large ball of earth about it, and you can carry it anywhere. Mulch rose-trees, and trim and cut them back.

THE WINDOW GARDEN.—If your boxes are all ready, you may lift crocuses from the garden, if you take a deal of earth up with them; anything for an early show of bloom. Also spring flowers, even primroses, will do well, and polyanthus of any sort. Meanwhile arrange your trellis-work and hang up your flower-basket, and in fine weather sow your climbing plants.

Correspondence.

G. and W. ALLISON.—The best way to polish stones is on a lathe. Some notes on polishing appeared in No. 254.

W. K.—We really see no reason why "any person of ordinary ability should not make an air-pump." At the same time he will have to be very careful in his workmanship. You will find a description of the instrument in any encyclopædia or manual of physics.

W. B. C.—Walton's "Compleat Angler" was first published in 1653. Cotton's "Angler" came out in 1676. There have been dozens of subsequent editions. A note to the publishers of the one you mention would procure you the date. The "Compleat Angler" survives more for its literary merit than its technical details.

MEDICUS.—A brace for the cure of round shoulders is sold at most indiarubber shops. One is freely advertised. The cost is about half-a-crown.

A. I.—Under the new Government scheme a payment of one penny per week by a person of twenty-one years of age ensures ten pounds at death.

This end-game is an additional proof that the old rule of one queen only on the board at the same time for each player brings out superior variations. We have never met with a finer game following this rule.

THE surest method of arriving at a knowledge of God's eternal purposes about us is to be found in the right use of the present moment. Each hour comes with some little fagot of God's will fastened upon its back.—*F. W. Faber.*

CHEMIST.—Meldola's "Chemistry," price eighteenpence, published by Murby, Ludgate Circus, would probably suit you.

TAJO.—We only know of the ordinary course. A marine engineer's certificate is not obtainable as a matter of favour.

F. H. M.—The "Language of the Restless Fays" was in the third volume. See the index.

S. F. C.—Yes. The topaz is an emblem of fidelity, and is dedicated to November. In the Zodiac it signifies Taurus, and in Christian art is assigned to St. James the Less.

G. W. VINCENT (Toronto).—Impossible! Give illustrations of *all* the insects! Why, one order alone would fill a volume!

F. J.—1. We have no views on Danish butter. Is it a mystery? 2. You must choose your own colony. 3. The rates for telegrams to places abroad can be ascertained from any postal telegraph office.

U. BEATON.—The article on "Ham-mocks, and how to net them," was in the second volume.

C. H. MAJOR.—The portrait of Queen Victoria has already been given. See the second volume.

A READER OF THE "B. O. P."—Boats are let out by Messrs. Searle for the trip from Oxford to London. For prices apply to them. See the "Rowing Almanac," or read our articles in the third volume.

T. B. COX.—"The little tags on ships' sails" are the reef points. They are used for reefing the sail. Roll the sail up to the line of the reef points, and keep it in position by tying them under it.

TURNER.—You can get full details as to the Whitworth Scholarships by applying to the Secretary, Science and Art Department, South Kensington, S.W.

H. MORRIS.—The modes of addressing people of rank, etc., are given in most ready reckoners and books on etiquette. You will find a page devoted to the subject in the "Standard Commercial Handbook," published by Warne and Co.

B. E. C.—A cheap book on organ building is published at 170, Strand. It costs five shillings, and is by C. A. Edwards. A long series of articles on the same subject has recently appeared in "Amateur Work," published by Ward, Lock, and Co.

DIDO.—If you will apply to your post-office you will be supplied with a pamphlet giving all particulars.

INDEX.—Back numbers and parts are sold at the same prices as current ones; but Vols. I., II., and III. are no longer procurable in the number form.

CABO DE BON ESPERANCE (Oudtshoorn).—1. Onida is the writing name of Louise de la Ramée, a Jersey lady. It is pronounced as you say. 2. The phrase "fourth estate" has been so frequently used that it is difficult to say with whom it originated. Some say Junius, others date it back still earlier. It means that matters of public import are as a rule first discussed in the press before they come under the consideration of the three estates of the realm—which, by-the-by, are not the Sovereign, Lords, and Commons, as often stated, but the Lords Spiritual, the Lords Temporal, and the Commons. 3. The chained unicorn is the old supporter of Scotland. See an article on the National Arms in Vol. III. 4. An elaborate joke—that is all.

W. C. DENDY.—"Mad as a hatter"="Mad as an adder" cockneyfied. "Mad as a March hare," because hares are out of season after February, and then begin to breed.

FLYING SCOTCHMAN.—It is only a question of safety. Trains have been driven on special occasions at a rate exceeding that you mention. The company makes no difference, as all the competing lines agree to a certain maximum.

G. E. M.—Refer to the third and fourth volumes, where the subject of skin-dressing was gone into at length. If you have not the indexes, send for them. They cost one penny each.

B. H. W.—Situations in banking companies are generally obtained through the influence of the directors. There is always an examination in the better-class establishments.

T. REES.—The word Welsh is English, and means "foreign."

OUT LIKE A LAMB!

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XIII.

ABOUT a fortnight after the events detailed in the last chapter, Smirnoff was sitting in his own particular den or "cabinet." He had received a letter from his correspondent at Berlin informing

him that in consequence of a suggestion of his turning out successful he was the fortunate possessor of a large accession of wealth.

Smirnoff loved money, not for its own

sake, not as a miser loves his hoards, but for the amount of service it was able to do for suffering humanity. Besides which he, like most men, was fond of success. His idea had been successful; he, a Rus-

"He bounded into his arms."

sian, had actually dictated to the Germans and had made the fortune of the house interested and greatly increased his own.

A quiet man in his manner was Smirnoff, but resolute as a navy captain in carrying out his plans. Seldom put out by external events, but not in the least indifferent to the success or failure either of himself or others, he was always ready to help when possible, and was never in a better temper in his life than on the afternoon of which we write. Russian-like, he was enjoying a glass of tea without milk or cream, but with a slice of lemon in it, and reading an English newspaper, from which, however, a large portion had been cut out by the scissors of the censor.

"How happy are those English!" he exclaimed. "They have real liberty, they can say what they like, and have their own opinions as *men*. They have no censor to cut up their papers and stop their books and letters. They have no police bothering them about their private affairs."

Here the soliloquy was interrupted by a servant, who announced Colonel Michael Nicolaevitch Masloff, from Kursk. Smirnoff let the paper drop from his hands, and looked up in speechless astonishment.

"What can he want?" he said at last, when speech returned to him. "Show him in, anyhow. This comes of being too pleased with success. Now some turn of fortune will take place. Well, what is to be done!"

At this moment the servant announced the colonel, who, in full uniform, waxed, oiled, polished, brushed, and laced to perfection, entered the room with that wonderful combination of internal pride and external humility—a Russian bow.

Smirnoff rose from his chair to receive his guest, who, advancing with extreme politeness, said,

"I have the honour of addressing Metrofan Dmitrievitch Smirnoff, I believe?"

"That is my name, Colonel Masloff," said Smirnoff, looking at the card. "In what way can I have the honour of serving you? You will excuse me if I remind you that it is just after business hours, so that any business matter should be put as briefly as possible."

This was what would under ordinary circumstances have been considered a rebuff, but the colonel was a man of business in *his* way and not to be rebuffed in the pursuit of it. He only smiled and said sweetly,

"Precisely so! That is the reason why I call upon you at this time, when I know that I am not interfering with the business of the office."

"Then your business is private?"

"Well! yes, and yet it involves questions which have been before the public."

"May I request you to be seated?"

"Many thanks."

"Will you take a glass of tea!"

"If you will give me one."

And the colonel settled himself upon the sofa. He helped himself to a cigar, and cut the lemon for his tea, with all the air of a man who knew that he was going to have a long interview which was bound to be interesting to one of them at least.

The servant withdrew after placing the samovar on a little table specially arranged for its reception. When he had left the room the colonel produced a

small leathern letter case from the breast of his uniform, from which he extracted a newspaper slip containing the first offer of a reward for the discovery of Ivan. Smirnoff turned pale with excitement.

"Stop," he cried. "Before you say another word, tell me this: Is the boy safe?"

"He is."

"Thank God! Now proceed to business. Make your own terms, only let me have my dear little pet back again. Never mind the reward, that's all right. I yearn so much for my boy. I must have him!"

To hear the calm man of business pouring out his soul like this in a most extraordinary voice between laughing and crying!—to have seen his excited face, his heightened colour and the unwonted drops of "human dew" in his eyes—would have sent his credit on 'change down fifty per cent. in a moment! The police colonel, albeit accustomed to moving sights, was greatly affected at seeing Smirnoff thus, and he said, in a tone of deep feeling,

"I shall account myself extremely fortunate in being the humble means of restoring the boy to one who seems so thoroughly to have adopted him. He is now here at the house of General Kakaroff."

"Can we go thither at once?" said Smirnoff. "I am greatly interested in the boy's welfare, and only want to see him. May I give you some more tea? or shall we go to him at once?"

"I think we can go at once, as soon as you please. I suppose the question of reward offered will not be a difficult one? I have had some trouble and much expense in getting him from the hands of the monks!"

"Of the monks?" exclaimed Smirnoff. "Did you really get him out of the hands of monks? How can I ever thank you? I should never have seen him again but for you, if he was among the monks! The reward offered was large, some twenty thousand roubles, which, however, had to be divided, as I learn from Kakaroff, between the finder of the boy and some persons of great influence at court who excited him to the exertions he made in advertising and so forth. Of course you heard of it through him."

"Why, yes! That is true," said the colonel; "but all the trouble and the whole merit of the discovery I claim as mine."

"And the boy is safe?"

"Sound as a roach—perfect in wind and limb."

"Well, then, colonel, look here. Will you be satisfied if I take it upon myself to satisfy Kakaroff and the court lady and give you the twenty thousand roubles clear, provided that you prove to me that the whole merit and trouble of discovery were yours?"

"I am astonished beyond bounds at such munificence! I am more than satisfied."

"Well, there are two conditions that I make—first, that you will not tell Kakaroff a word about your additional reward from me, but take just what he may offer you without a murmur; and, secondly, you must remember that this payment is only to be made on condition that little Ivan is given over to me in perfect health."

"I accede to your conditions with all

my heart, although there will be some difficulty in eluding Kakaroff's direct questions as to whether I have received more from you."

"Then suppose I do not give it you until after all arrangements with him have been made. You can then say that you have not received anything from me, but that I have referred you to him."

"But suppose he asks me *after* I have received the money, what shall I do then?"

"Then, when I have Ivan in my own hands, and Kakaroff is satisfied—then I don't care what you do or say; only I don't want him to know of this *now*. Shall I give you a written obligation to pay you? What would you like me to do?"

"I leave the matter to your own sense of honour. It has been solely my work since Kakaroff drew my attention to the fact of the boy having been traced to the Kursk line and to some station lying just before the town itself."

"How was that discovered?"

"A rascally student took him to a den in the Novoye Derayvnie, where he lay lost for a time. To throw the police off the scent Ivan was disguised as a girl, and sent under the guidance of a young woman to the intermediate station I have referred to on the Kursk line. By this means he was lost as a boy. He was taken to the monastery of Kupsk, where some of my people had connections among the serving monks. The telegram from Kakaroff put me on my mettle, and I asked about among our people who had been most away from Kursk to look after such a boy, and I found, through a discharged coachman, that he was at Kupsk. When sure of his identity I arrested him, and thus took him from the monks, and he is now here!"

"Please give me the name of the coachman who recognised him."

The name was duly entered in the notebook of the merchant, who, having finished writing, said, "Now, who was the girl who took charge of him?"

"Her name is Anastasia von Hohenhorst."

"What was the monastery—Kupsk, I think you said?"

"Exactly so."

"Well, then, we will go. I shall give Kakaroff twenty thousand roubles as promised. Of that you will get but little, I fear. Then I give you twenty thousand, of which he is to have nothing. Next, I shall provide handsomely for your gendarmes and people; then I shall take special care of the coachman at Kursk. Anastasia von Hohenhorst shall be a rich woman, and the monastery shall not be the worse for the hospitality shown to my boy. Here, you Nikieter—Stefan, there! is the drosky ready? Step in, colonel. Sascha, are you going to drive? All right. Drive as if a whole pack of wolves were after you. You know the feeling." The man grinned. "Then make for the headquarters of the police on the Tverskaya Boulevard."

And away flew horse and drosky. Smirnoff was greatly excited; all the quiet, calm, steady-going man of business had vanished, and an excited, determined, and almost wildly-animated enthusiast had taken his place.

When they arrived they found no trouble about admittance. Orders had already been given on that score, and servants were waiting ready to conduct

Smirnov immediately to the cabinet of the police-master. On entering the room Smirnov was surprised at seeing a little boy whom he did not know waiting to receive him—for the plentiful change of air, the excellent diet, and the exercise he had undergone had added so much to Ivan's stature and general appearance that he looked fully thirteen. His red silk shirt and other dandyifications all helped to confuse Smirnov.

At last Ivan exclaimed, with a roguish twinkle in his mischievous eye that no one could mistake, "Don't you know me, Metrofan Dmitrievitch? What a shame!"

There was something in Ivan's voice which, it seems, no one could forget. As soon as he heard it Smirnov rushed forward with open arms. The boy leaped into them, and in the next moment was sobbing on the breast of his more than father.

Maslov left the cabinet, and asked a servant whom he found in waiting outside the door to convey him at once to General Kakarov. The man told him that he was with her excellency and could not be disturbed. Whereupon the colonel gave the man his card, on which he wrote, "All is well; they are in your cabinet. Do you wish them to see the two boys and the girl?"

The man took the card, and in a short time returned with a request that the colonel would follow him. This of course he did, and was ushered into the room in which Madame Kakarov had received Annie. The present tenants of the chamber were the boys from the First Gymnasium, Madame Kakarov, and the chef.

"Well, colonel," said the prefect, rising as Maslov approached. "I am glad that all this is off your mind so far. Anna Feodorovna, allow me to introduce to your special notice my friend Colonel Maslov, who has been most actively instrumental in bringing this strange affair of the Dobroff mystery to a successful close." The lady of the mansion gracefully extended her hand, which Maslov raised to his lips. "These are our two young friends from the Gymnasium, who have come by permission of their friends to see you and your interesting charge. We must allow Mr. Smirnov time to realise the recovery of his lost pet, and then, with your kind permission, Anna, I shall present him to you, and I should be glad to witness the meeting between the boy and Hermann's daughter."

After half an hour's pleasant chat the colonel, accompanied by Kakarov, withdrew. They entered the private cabinet and found Smirnov and Ivan in deep conversation.

"Ha! Mr. Smirnov. I congratulate you on the recovery of your pet. May I beg you to step this way? My wife has a great desire to see you, and there is no time like the present."

"I had much rather be excused," said Smirnov; "but a lady's will is law, and so we must yield. Do not think me churlish for wishing to be excused. The fact is I am rather too much agitated by the unexpected occurrence of to-day, and am not fit for society."

"Quite correct, we can only honour you for feeling so strongly; but it is nothing more than a family party—or rather no party at all. My wife, myself, and a lady who greatly wishes to see little Ivan. Pray come!"

"Certainly; but you will let us off directly. I long to get home with him. By-the-by, to whom is the reward to be paid? I suppose to the gentleman who really discovered him—Colonel Maslov."

"There are many considerations to be entered into before that question is decided; and first of all there is a certain court lady who has taken a most lively interest in the boy, and who, in fact, first put me on the scent."

"Oh! I know—the Princess Tcherbolinski! Leave her to me."

"How you could know of that little matter which I thought quite a piece of secret intelligence is strange. However, if you take her off my hands I make no claim for my part in the affair, but I should like something done for the family of one of the gendarmes who was shot in the cellar the other day. The other was a bachelor, and it does not matter."

"I have settled an annuity on the widow of your Cossack who was killed at Zakolniki, and I have no objection to do as much for the widow of the gendarme, but I do not see that this should come out of the reward. If all these things are to be subtracted there will be little left for our friend the colonel, who besides has something to do for his people at Kursk."

"You talk like a prime minister giving away pensions. Then you know there are our Gymnasium boys, Abrazoff and Popoff. We must not forget them."

"I never forget those who serve me in any way. And now, having an idea in my mind of what is to be done for the inferior persons in this to me most interesting domestic drama, there comes a question of still greater importance—namely, What can I do for you?"

"My dear sir, I am delighted to have been the means of serving so loyal and so good a man. A time may come when I may need aid, and then I will come to you and freely ask you to help me. Till then let it remain as it is between us. I shall remind you of the matter some day, and you may be able to serve me more effectually than by mere pecuniary aid. Not that I despise that, though," he added, laughing. "I never believe much in people who say that they don't care for money!"

The police-master of Moscow placed his hand caressingly within the arm of Smirnov and led him to the apartments of his wife, little Ivan holding on by his other hand. As soon as they came to the door of the crimson drawing-room a servant stationed there opened it and admitted the trio. But no sooner were they fairly within the room than Ivan, bursting from Smirnov, exclaimed, "There she is! Annie, Annie!" and as the girl rose—which she did involuntarily at the sight of the boy—he rushed at her with delight, utterly regardless of the presence of others.

The lady of the mansion was much affected by the action, and observed to her husband, "His heart is in the right place, at all events."

"I owe you a deep debt of gratitude, mademoiselle," said Smirnov, "for your tender care of my little adopted son, who, however, is as dear to me as though he were my own flesh and blood; and, indeed, those who have shown kindness to him have a much stronger claim on my gratitude than if they had shown it to me. You have secured a warm friend

in Ivan, and through him one in me. He has told me how good you have been."

"Ivan was in a very bad plight when I first saw him," replied Annie. "He had been spirited away by as thoroughly bad a man as ever lived, and given over to one whom he believed to be worse than himself, although I know the real working of my father's heart. He was not originally cruel or wicked, but he became attached to these dreadful revolutionists, and his whole being changed except in his tenderness for me, to whom he was the best of fathers."

The meeting between the schoolfellows was not so affectionate as might have been expected when we remember how ready the two elder boys were to do everything in their power to help the authorities to find Ivan.

They came forward with extended hands, however, saying how glad they were to see him; but as soon as the talk with the elders had become more serious, Abrazoff said to our hero, "Nice chap you are to get into scrapes, and pull the whole school in with you! Schwann is as savage as a bear with the toothache! I would not be in your shoes for a trifle!"

"You are decidedly in for it!" added Popoff. "Old Schwann was talking with the inspector to-day about what the heaviest form of punishment could be that they might inflict. Horrible fellow when the fit takes him is Schwann!"

The boys were the first to leave; then Maslov went, having first arranged to call in the Loubiyanka the following morning. There was an affectionate leave-taking between Annie and Ivan. Kakarov seemed delighted with Smirnov, and actually accompanied him to the hall—a thing which he had never been known to do before with any one under the rank of count of the empire or a prince of the Imperial family.

Returning, he found Annie looking very tired and extremely pale—at which no one in his senses could wonder. As the police-master was about to utter some commonplace politeness, an official entered with a telegram from the Minister at St. Petersburg. Kakarov tore it open, and after reading it through wrote an answer on a piece of letter-paper lying on one of the tables in the room. He gave this answer to the man, and, without taking any further notice of the ladies, strode anxiously up and down the room.

At last his wife asked him whether he had received bad news of any kind—a question which seemed to recall him to himself at once.

He approached the settee, and, placing a gilt chair opposite, sat down, facing his wife and Annie, saying, with extreme courtesy, "I must beg you both to pardon me; I have no right to allow the worries of official life to affect me in social relations, but I am somewhat annoyed by unexpected news from the Minister."

"Then," said Annie, "I ought to leave you. My presence here is only an intrusion under such circumstances. But—whither am I to go? I have no home, I am alone and friendless. I—Here she broke down altogether and sobbed as if her heart would break. The lady of the house tried to soothe her with sweet womanly words of comfort.

"Rooms," said Kakarov, kindly, "will be prepared for you. As there must be a very close investigation into these sad events, you will most probably have to

be examined. It will render the whole thing more agreeable for you to be on the spot."

"What is the matter, general?" asked the lady of the house when Annie'sie had gone to her room. "There seems to me to be something rather awful in this business. You are much annoyed."

"I don't think that there is much to be done in this case. I thought I was to have had the management of it, but it is put into the third section!"

"How shocking! then perhaps Annie'sie, whom you have recommended to me so warmly, and who has recommended herself still more warmly by her simple ways, will fall under their judgment."

"I fear so. Her father is already in prison, and that is quite right. The student who took the boy off I have here."

"Why? how so? are you turning the palace of the police-master into a prison?"

"Not exactly, but there in the western wing *was* the old prison, and the rooms have the grated windows of the good old times."

"What will become of her?"

"Difficult to say. You see she is some how or other mixed up in it. Neither she nor Masloff has said a word about her uncle to whom she took Ivan at first, and who carried him off to the monastery. This will go very much against her in hearing the cause. Her action in the whole story will look very suspicious. I begged the Minister of Justice to let me adjudicate, but he sends a prompt and peremptory prohibition of my doing more than to keep such prisoners as I have in close confinement. I have Palitzki in the old guarded wing, I have Annie'sie in this house, which, as you say, is converting our palace into a prison. But I cannot send Annie'sie to the ordinary felon's jail, nor will I send Palitzki, who saved my life, to certain death, or worse, in Siberia, without an effort to save him."

"That is rash in your position. The man is a well-known member of this democratic movement, and will certainly be sent off. It is no time for sentiment."

There was life enough now in the House Smirnova? A respectable German lady was engaged as a housekeeper. Windows were cleaned, and fresh white blinds and lace curtains were seen through the now transparent double panes of glass. Many were the visitors in the course of the day who called to congratulate Smirnov on the recovery of his pet, whose loss had been known all over Moscow.

Ivan's bright face grew brighter with pleasure when he found so many people interesting themselves about him; but he was greatly surprised at never meeting Annie'sie out, save in the carriage with Madame Kakaroff. He saw her sometimes at the house of the police-master, who was much graver in his manner than he used to be. He never referred to Annie'sie unless first asked about her. Smirnov and Ivan both thought him changed in some manner. They did not know that Annie'sie was a State prisoner.

(To be continued.)

Our Artist's Dream!

CHAPTER XXII.—A MINE OF A NEW SORT.

MISS WATKINS, notwithstanding Cyprien's silence, soon heard all about the visit of the masked men.

"Ah!" she said to him. "Is not your life worth more than all the diamonds in the world?"

"Dearest Alice—"

"You must not experiment in that way any more."

"You order me?"

"Yes! I order you to leave off as I once ordered you to begin. That is if you like to take orders from me."

"As I like always to obey them," said Cyprien, taking the hand that Alice held out to him.

But when he told her what had happened to Matakia she was in despair, par-

ticularly when she learnt that her father was the cause.

She, like Cyprien, did not believe in the poor Kafir's guilt. She, like him, would do all she could to save him. But how to do so and how to influence her father in his favour was more than she could discover.

Mr. Watkins had obtained no confession from Matakia. He had shown him the gallows on which he was to hang; he had promised him pardon if he would only confess; but all to no purpose. Then, having to give up all hope of ever recovering the Star of the Settlement, he had gone quite mad with rage. No one dare come near him.

The day after the sentence Mr. Wat-

kins, suffering rather less than usual from his gout, took advantage of the relief to put his papers in order. Seated in front of a large writing-table of ebony inlaid with yellow marqueterie, a relic of the old Dutch domination, stranded after many vicissitudes in this remote corner of Griqualand, he was leisurely running through his different assignments, agreements, and correspondence.

Behind him Alice, lost in her work, was stitching away without noticing the big ostrich Dada, who stalked about the room with his usual gravity, sometimes giving a glance out of the window, sometimes giving a long scrutinising look at Mr. Watkins.

Suddenly an exclamation from the farmer made Alice raise her head.

"That bird is a nuisance!" he said. "Look, he has swallowed a deed! Here, Dada! Tsh! Tsh! Give it up! Give it up!" And then came a torrent of abuse. "You wretched old brute! You have swallowed it! A most important thing like that! The deed of assignment that gave me the Kopje! It is abominable! I'll make you give it up—if I have to throttle you!"

And Watkins jumped off the chair and ran after the ostrich, which made two or three turns of the room and then bounded out through the open window.

"Father!" said Alice, aghast at her favourite's greediness; "do be calm! Listen to me! You will make yourself ill!"

But Watkins did not hear her. The ostrich's escape had driven him to distraction; and, almost choking with rage, he hobbled after the bird, and roared out,

"I have had too much of it! I will settle you! I am not going to give up my title-deeds in that way! I will put a bullet through you, and we'll see!"

"Bounded out through the open window."

"The ostrich seemed to recognise the danger."

Alice burst into tears.

"Father! Do have mercy on the poor thing!" said she. "Is the paper so very important? Cannot you get a duplicate? Will you make me miserable and kill poor Dada for such a trifle as that?"

But John Watkins would hear nothing. He was looking round on all sides in search of the victim.

At last he caught sight of Dada standing by the side of the hut occupied by Cyprien. Bringing his gun to his shoulder he took aim, but the ostrich seemed to recognise the danger, and disappeared round the corner.

"Just wait! Wait! I'll have you, you brute!" said Watkins.

And Alice, more frightened than ever, followed him to make yet another appeal for mercy.

They reached the hut and walked round it. No ostrich! Dada had become invisible!

He could not have left the hill, for they would have seen him. He must have gone inside the hut through the door or through one of the windows which were open at the back.

So thought Watkins. And he hurried up and knocked at the door. Cyprien opened it.

"Mr. Watkins? Miss Watkins? I am delighted to see you. Come in," said he, looking very much surprised at the unexpected visit.

The farmer hastily explained matters. He was very much out of breath and very much excited.

"Well, well, have a look for the culprit," said Cyprien.

"And I'll precious soon settle his hash for him!" added the farmer, brandishing his gun like a tomahawk.

have got out of it yet. Will you allow me to try the operation? I have worked at zoology at the Museum, and I know

"What a shout escaped from John Watkins!"

At the same moment a glance from the young lady showed Cyprien the horror with which she regarded the projected execution. His mind was consequently made up immediately. He would not find the ostrich.

"Li," he whispered to the Chinaman, "I expect the ostrich is in your room. Tie it up there and let it get away as soon as I have taken Mr. Watkins in the opposite direction."

Unfortunately this excellent plan proved a failure at the outset, for the ostrich had taken refuge in the very first room into which Mr. Watkins went. There it was making itself as small as possible with its head stuck under a chair, but as visible as the sun at noon-day.

Watkins rushed at it.

"Now, you brute, your time has come!"

But, angry as he was, he hesitated. To fire a gun point blank in a house that did not belong to him was rather too strong a proceeding.

Alice turned away and wept, and saw nothing of this hesitation.

Then a brilliant idea occurred to the engineer.

"Mr. Watkins! You only want to recover your paper? Well, you need not kill Dada to do that! We can open the stomach, for the document can hardly

quite enough to manage a little surgical affair like that."

Whether it was that the idea of vivisection flattered the vengeful instincts of the farmer, or that his anger was cooling down, or that he was touched by his daughter's tears, anyway he allowed himself to be persuaded, and accepted the compromise.

"But we must not lose the document," insisted he; "if it is not in the stomach we must go farther down for it! I must have it at any price."

The operation was not quite so easy as it looked at first sight, notwithstanding the resigned attitude of the wretched Dada. A small ostrich has prodigious strength, and once the patient felt the amateur surgeon's knife the gigantic Dada might turn on them in anger and escape. And so Li and Bardik were called in to assist.

First of all the ostrich had to be secured. The lines which Li always kept in his room came in very handy. An arrangement of hitches and knots soon bound Dada beak and foot.

Cyprien did not stop there. In order to spare the sensibility of Miss Watkins he resolved to save the ostrich all pain, and so covered its head with a handkerchief moistened with chloroform.

That done, he began the operation, not without considerable anxiety.

Alice, shuddering at these preliminaries and pale as death, had taken refuge in an adjoining room.

Cyprien began by feeling at the base of the bird's neck so as to find the gizzard. This was not very difficult, for the gizzard forms at the upper part of the thoracic region a mass of some size, hard and prominent, which the fingers could easily distinguish among the softer parts of its vicinity.

With a sharp penknife the skin of the neck was carefully cut into. It was large and loose like that of a turkey and covered with grey down which was easily pressed aside. The incision caused just a little blood to flow, and this was carefully wiped off with a wet rag.

Cyprien noticed the position of the two or three important arteries and carefully pulled them aside with the wire hooks he had given Bardik to hold. Then he opened a white pearly tissue which filled a large cavity above the collarbone. He had reached the gizzard.

Imagine the gizzard of a fowl increased almost a hundredfold in size, hardness, and weight, and you have the gizzard of the ostrich.

Dada's gizzard looked like a large brown pocket greatly distended with the food or the foreign bodies that the voracious animal had swallowed during the day—or in the past. And it was quite enough to see this brawny healthy organ to understand that there was little danger in resolutely attacking it.

With the sharp hunting-knife that Li placed in his hand Cyprien cut deeply down into the mass.

Down the fissure it was easy to introduce the hand to the very bottom of the gizzard.

The first thing Cyprien lighted on was the deed so much regretted by Mr. Watkins. It was rolled up into a ball, slightly creased perhaps, but still intact.

"There is something else," said Cyprien, who had put back his hand into the hole. And bringing it back he found an ivory ball.

"The darned ball belonging to Miss Watkins," he exclaimed. "Only think, it is five months ago since it was swallowed. Evidently it could not pass the lower orifice."

He handed the ball to Bardik, and resumed his investigations like an archaeologist amid the ruins of a Roman camp.

"A copper candlestick!" he exclaimed, extracting one of those useful articles crushed, broken, flattened, oxydised but still recognisable.

Here the laughter of Bardik and Li became so noisy that Alice, who had just entered the room, could not help joining in.

"Some coins! A key! A small-tooth comb!" continued Cyprien, proceeding with his inventory.

Suddenly he turned pale. His fingers seemed to grasp an exceptional form! No! There could be no doubt of it! And yet he hardly dared to believe in such good fortune!

At length he pulled out his hand and held up the object he had found.

And what a shout escaped from John Watkins!

"The Star of the Settlement!"

Yes. The famous diamond was recovered intact, and had lost none of its brilliancy. It sparkled in the light from the window like a constellation.

One strange thing about it was noticed

at once by all present. It had changed colour!

Instead of being black as formerly, the Star of the Settlement was now rose-colour. A beautiful rose, which added, if possible, to its limpidity and splendour.

"Do you think that will damage its value?" asked Watkins, as soon as he could speak, for surprise and delight had almost deprived him of breath.

"Not the least in the world," said Cyprien. "On the contrary, it is an additional peculiarity which classes the stone among the rare family of chameleon diamonds. It does not seem to be very cold in Dada's gizzard, though it is generally due to sudden changes of temperature that we get the alteration in tint of the coloured diamonds."

"Ah! At all events I have found you again, my beauty," said Watkins, clasping the diamond in his hand to assure himself it was not all a dream. "You have caused me so much anxiety by your flight, ungrateful Star, that I shall not let you go again."

And he lifted it to his eyes, and he gave such a longing look that he seemed about to swallow it like another Dada.

Cyprien ordered Bardik to give him a needle threaded with coarse thread, and then he carefully replaced the gizzard of the ostrich. Then he sewed up the incision in the neck, and then he undid the bandages.

Dada, much crestfallen, hung his head and did not seem disposed to move.

"Do you think he will get over it?" asked Alice, more interested in the sufferings of her favourite than in the reappearance of the diamond.

"Get over it, Miss Watkins?" said Cyprien. "Do you think I should have tried the operation if I had not been sure he would? In three days he will feel nothing of it, and in two hours he will have filled the curious pouch we have just emptied."

Reassured by the promise, Alice gave the engineer a look of gratitude that fully recompensed him for all his trouble. As she did so Mr. Watkins had just succeeded in convincing himself that he was

in his sober senses, and that he had really recovered his wonderful diamond. He left the window.

"Mr. Cyprien," he said, in majestic and solemn tones, "you have done me a great service, and I do not know how to reward you for it."

Cyprien's heart began to leap.

To reward him! Well, Mr. Watkins, there was a very simple way! Was it so difficult to keep your promise and give your daughter's hand to the man who brought back the Star of the Settlement? Was it not the same as if he had brought it from the depths of the Transvaal?

So Cyprien thought, but he was too proud to speak. And, besides, he thought the same idea might occur to the farmer.

But Watkins said nothing at all about it, and having beckoned to his daughter, left the hut and returned to the farm.

It need hardly be said that a few minutes afterwards Mataka was set free. But he had had a narrow escape of paying with his life for the greediness of Dada, and had got off unexpectedly well.

(To be continued.)

BOY-BAITING.

By THE ODD FELLOW.

let me indulge in a few reminiscences on the subject.

There can be no doubt that flogging and caning are on the decrease. The next generation will probably know of bodily torture by tradition only. It is true that in a recent Blue Book on Education one Commissioner (a Scotchman) would have boys whipped "for all bad, if not all offences," but against that must be put the recommendation of another Commissioner (also a Scotchman; let us be just), who thought that "only in exceptional cases it should be resorted to."

However, fifty years ago, even twenty, it was the commonest punishment in both public and private schools; in some it was the only one. Perhaps it answered in certain cases; undoubtedly it did not in others. At some private schools a point was made in the prospectus of the fact that no corporal punishment was inflicted. This caught the eye of tender-hearted parents who could not bear the idea of their darling boy being hurt.

But the schoolmaster who had abolished caning did not find it the easiest thing in the world to provide a satisfactory substitute. There was the everlasting copying of odes or lines, but both master and pupil wished for variety. How could it be obtained?

In the course of my researches I have come across some curious experiments. All that I shall mention I will vouch for as having been used at some school within my knowledge. I mention this, as one or two would not claim credence on their own merits.

Which of you, for instance, ever heard of a boy being given a twisted ball of twine to unravel as a reward for misconduct? Yet at one school this was a regular punishment and by no means a pleasant one, the use of the knife to cut the Gordian knot being out of the question.

At the academy at which I spent a portion of my boyhood there was a peculiar punishment for continually falling asleep in church. The somniferous boy had to undress and go to bed at every playhour during the next day. In warm weather it was endurable, but in winter—!

Almost every misconduct at this school met with its reward in the shape of lines. Lines for not knowing lessons, lines for being late, lines for bolstering, lines for everything. "Disorderly conduct meets with its due reward," was a favourite—with the masters. The boys got a facility for writing them, and could knock off a hundred in no time, or even in less if they used Jenkins's patent pen, which consisted of two tied together. But it was found that these lines ruined the handwriting, so a variation was made. Large words had to be written reaching right across the slate, and had to be filled in laboriously. There was no shirking these, and they were detested accordingly.

Another variation, not, however, adopted at our school, was the writing out and bringing up fifteen lines every quarter of an hour throughout the day's playhours. This was an aggravating business; the victim couldn't settle down to anything. Directly he went out he had to come in and start another miserable fifteen; then he was free for the rest of the quarter of an hour, when he had to begin again.

Some years ago Bedford County School had a Mr. Groom as head-master, and a very good one too if we may judge from the fact that he raised the numbers from twenty-five to a hundred and fifty in eighteen months. He invented sitting perfectly still as a punishment. It was an odd sight to watch thirty or forty boys in a row doing nothing for twenty minutes. The incorrigible boys were sometimes put to roll the garden-path in view of all the boys and any visitors who might be present. The victims used to ask for a caning instead.

Drawing triangles was an established punishment at another school, perhaps not so useless a proceeding as some, for it produced accuracy of hand. Making a boy stand on a form in the dark was another. Sometimes the boy fell asleep standing, and came down with a run.

Ah! you boys! why can't you cease to torment your instructors? Why make your masters puzzle their brains to invent a new method of rendering you uncomfortable?

By this time I suspect that some of you must think the Odd Fellow no longer exists; that he has either come into a fortune and given up writing for your amusement and instruction, or else that he has joined the majority. Not a bit of it. As a festive juvenile poet once sang of a schoolfellow:

"Still the thick birch or supple cane he feels;
Still on this earth he kicks his festive heels."

"Festive heels" was voted a good epithet; it is almost Horatian.

However, I cannot confess to being still a victim of birch or cane, and if I ever was—but perhaps silence is best on that topic. Yet, since I have mentioned schoolboy woes,

A SCHOOLBOY'S ADVENTURE WITH MOONLIGHTERS.

BY JAMES COX, R.N.,

Author of "Fascinated by a Fakir," "How I Saved My Aunt's Diamonds," etc.

CHAPTER IV.

WIFTLY the short winter afternoon was drawing to a close, and the sun was gradually disappearing behind the bank of ash-coloured clouds on the western side of the lough as the keel of the boat grated on the shore of a small wooded island. Overhead the clouds were gathering in great black masses, and already large flakes of snow were falling on the outstretched arms of the firs, and covering the earth with a soft white mantle.

"How jolly cold it's getting, Charley!" said Reggy, as he stepped out of the skiff.

"Yes, old man, right you are."

"Now, then, we'll just run up as far as the hut, and then for home, ducks or no ducks."

"Where's your hut?"

"Oh, the hut's on the other side; we shall be there in five minutes. Come along—how dark it's getting!"

"There you are, Reggy," said Charley, pointing to a small building.

"Hullo! what's this?" Charley drew attention as he spoke to some footprints on the freshly-fallen snow.

"Cannibals," suggested Reggy, with a smile.

"No; but there's somebody in the hut. Don't make a row! Whoever can be there?"

The boys advanced cautiously towards the building, and as they neared it they listened. The sound of voices engaged in what appeared to be angry argument fell upon their ears.

"Shamus, remimber yer oath. No skulking this time, ye thief of the world. Nolan and the capt'in'll be after watchin' you."

"Hould yer whist, yer needn't be after remindin' me of the oath, but it's a plisant man the colonel is, and sorra a bit do I like the job."

"It's mighty partickler ye are gettin', Shamus; sure it's asier work than drownin' the cess collector. Are ye sure, bhoys, that the colonel comes back to-night?"

"Didn't O'Kelly hear him tell Mick Dennis at the station he'd be comin' down by the mail train?"

"Thru for you."

"Well, thin, lads, it's time we go to

meet the capt'in—ten o'clock was the hour, and there's the arms to be got first."

More conversation followed, but it was carried on in so low a tone that the two awe-stricken boys only managed to overhear a few disconnected words, but what they did hear was sufficient to convince them that a diabolical conspiracy was being arranged by the inmates of the hut to murder Colonel Fitzgerald.

Charley's face grew white and he trembled with excitement as he heard the villains make a movement towards the door, which was fortunately situated at the opposite end of the hut; but he had sufficient presence of mind to clutch Reggy by the hand and draw him back from the building to the shadow cover of the dwarf firs. And here the two boys watched half a dozen men file out of the hut and proceed to a boat drawn up on the beach.

"How fortunate for us that we landed on the other side," he whispered to Reggy, as the boat was shoved off by the men, who took their seats in it and pulled over silently to the main land.

"Yes, indeed; but now, Charley, there's no time to be lost; we must do something," said Reggy.

"Yes, I know. Father must remain in Galway to-night if he has left Dublin. It's half-past five now, I should think; the train arrives at ten; we must get home at once, and one of us will have to ride into town to meet him."

"He promised to telegraph on leaving Dublin, didn't he," remarked Reggy.

"Yes, and we ought to find the telegram up at the house if he intends coming; and of course if he hasn't telegraphed he can't intend to return to-night, so he'll be all right, and we needn't trouble about going to the station."

The two boys hurried off to the skiff, and as by this time it was quite dark they had no fear of being observed by the occupants of the other boat. In the course of ten minutes they had pulled across the lough with such good will that they reached the opposite shore, made the skiff fast, and were on their way across the fields and through the woods to Castle Kilrea, which they reached almost breathless.

"We must tell Eileen at once," said Charley, as they waited at the door while somebody inside was removing the ponderous bar and chain. "Look sharp inside there!" shouted the boy, impatiently.

"All right, Master Charles." And old Dan cautiously opened the door and admitted his young master.

"Oh, you wretched boys; where have you been all this time?" snapped Miss O'Dowd from the top of the stairs. "Aren't you ashamed of yourselves? Quick, Dan, bolt the door."

Charley, without paying any attention to his aunt's reproaches, hastened, followed by Reggy, into the drawing-room in search of Eileen, and immediately

asked her if any telegram had come from his father.

"No, dear. I'm so disappointed. I thought he would have been certain to come to-night. In his last letter, you know, he said he felt sure the trial would be over by yesterday evening. But how warm you two boys look. Is anything the matter?"

"Don't be frightened, sis.; we've something to tell you." And Charley at once communicated to Eileen the history of their adventure on the island.

"How dreadful!" exclaimed the girl. "Supposing papa has forgotten the telegram, and is now on his way home."

"Yes, I thought of that just now; but the train doesn't arrive before ten, so let us have dinner at once, and I will ride over to town directly afterwards."

Miss O'Dowd put in an appearance at dinner, and noticing the anxious look on Eileen's face, remarked, with an angry sniff,

"I believe you are concealing something from me, children. Whatever it is, let me know the worst. You have heard something. I won't be kept in ignorance; out with it. If we are all to be blown up I'll put on my old dress."

"No, aunty, it's not quite so bad as that; but we are anxious about papa. You remember that horrid letter we found in his study?"

"Don't mention it, don't mention it. Fitzgerald must be out of his senses to live in this wretched place. Oh dear, oh dear! why did I leave Dublin?"

"I think I shall start now, Eileen," said her brother, looking at the clock; "it's nearly eight."

"Where are you going, boy?" demanded the old lady.

"Oh, I'm just going to the station to meet father; and if we don't turn up by half-past eleven you'll know that we shall sleep in the town."

As the boy crossed the room towards the door he suddenly stopped and asked his aunt whether she was quite sure that Mickey had securely fastened up the house for the night.

"Yes, sir," answered Miss O'Dowd, with asperity; "it's well that you have somebody to take care of you all."

Somebody tapped at the dining-room door.

"Come in! Oh, it's you, Dan. Tell Mick to saddle."

"Mick's outside in the hall, yer honour," said the old servant; "and wants to spake to you for a minit," lowering his voice.

"What is it, Mick?" said Charley, as he passed into the hall, closing the door as he left the room.

"Shure, yer honour," said Mick, speaking rapidly, "I'm afraid there's some wickedness up. I was after coming thro' the shrubbery jest now after takin' a look at the stables—sure it's as dark there as pitch by the same token—and I heard—"

"Well, quick, what did you hear?"

"I heard some one moving on the snow soft as a cat, and thin I heard some one say, 'Is it you, Rooney?'"

"Shure it is," sez I.

"An'," sez the voice, which appeared to come up from the ground, 'have the bhoys arrived?'"

"They're comin'," sez I.

"The sooner the better," sez he, 'for it's near fruz with the cowl'd I am.'

"Where are yez stationed?" sez the voice.

"At the back door," sez I, "and the sooner I git there the better."

"Howld on for a minit, sez he; 'here's a drop o' the crater, Rooney. Where are ye?' And, yer honour, I jest stepped quietly off in the dark, leaving the rascal groping for his friend Rooney."

"Now, Mick," said Charley, "what do you think it all means?"

"Shure, the manin' of it's jest as plain as the nose on yer honour's face. It's the colonel's arms they're after. And it's the truth I'm tellin' you, Master Charles, if we don't give 'em up quietly they'll break in and take them. Bad luck to the villains!"

Here a loud peal rang through the house.

The dining-room door was thrown open. Out rushed Miss O'Dowd, followed by her niece and Reggy.

The hall-bell was again rung with violence.

"Who's there?" called Charley.

"Open the door, or we'll smash it in," was the reply.

"Murder! murder!" shrieked Miss O'Dowd, bolting upstairs.

Charley pointed to the guns that were arranged as a trophy on the wall in the hall, and said, quietly, to Reggy,

"Help Mick to take them up to the room over father's study."

"Are yez going to open the door?"

Charley clasped Eileen's hand, and said, "Go up with aunty, darling."

"Are you going to let them in, brother?" cried Eileen.

"No," said the boy, with a proud look.

"I shall stop them if possible. Mick, Dan, and I ought to prevent the cowards from getting in. Don't be frightened, dear."

Charley looked carefully at the door, and then went upstairs to the room above the study, which was immediately over the door, followed by Eileen.

"Don't come here, dear," he said.

"Mick, how many guns have you there?"

"Shure, there's a dozen, barrin' the blunderbuss and the two rifles the colonel brought home from Ingier."

"What about father?" whispered Eileen.

Reggy looked at Charley.

"I'll go and meet him," he said, quietly.

"Dan is too old to, and you'll want Mick here to help protect your sister."

"Thanks, Reggy. But how are you to get to the stables? If the wretches outside discover you, you'll be murdered."

"I'll try, at any rate," said Reggy, glancing for a moment at Eileen's tearful face. "I can get out of the window at the back of the house. Give me the keys of the stable, Mick."

"God bless and protect you, Reggy," said Eileen, wringing the boy's hand as he made off to his room with the intention of putting his purpose into execution.

"Look here," said Charley, who ran off after his chum, "don't think I want you to do what I wouldn't do myself. It's just this, old chap: I promised father I would take care of Eileen, and I think my place is here. When you get out of the grounds, don't go by the avenue, but through the plantation; ride as hard as you can to the police hut, which you know is about five miles this side of Galway; send the constabulary on to the castle, and then you will be able to meet father at the station; tell him everything, and no doubt he will get some more police in the town and drive home. I must be off. I hear the fellows hammering away at the door. I'm going to give them a little amusement and keep them engaged at the front while you get out of the house."

Charley returned to the room over the study, and, unfastening the shutter, opened the window, and, taking his gun in his hand, called out,

"What do you want?"

"It's the arms we want, and the sooner ye open the door the better."

"That's Tim Healey's voice," said Mick. "Begorra, Dan, there's more nor a dozen of 'em below."

"Shall I be after givin' the spalpeens a touch of the blunderbuss, Master Charles?" asked Mick.

"No, we won't fire until compelled."

"Now, look here, Healey," said Charley, who was anxious to engage the attention of the moonlighters until sufficient time had elapsed to enable Reggy to get clear away.

"Supposing I do give you the arms, will you and your friends go away quietly?"

"We will."

"Don't belave em," whispered Mick; "sorra a bit will they lave the place."

"Well, Dan," said Charley, in a loud voice, so as to be heard by the enemy, "go and collect the guns and bring them to me."

"An' the powdther too," called out Mr. Healey.

Dan grinned, and in obedience to instructions from his young master commenced loading the fowling pieces with small charges of shot.

Charley meanwhile ran to his aunt's room and found that lady dancing round the apartment in a state of great excitement, brandishing the poker in one hand and the shovel in the other, while Eileen was doing her best to calm the old lady's mind.

"I hope Reggy has got away all right, sis. Look here, aunt, you must try and keep quiet, and if you hear a row directly you needn't frighten yourself into fits."

"Master Charles," shouted Mick from the end of the corridor, "it's wanted ye are."

"Now then, out with them arms," was the cry that reached Charley's ears as he rejoined Dan and Mick.

"You'll have to wait a bit," rejoined the boy from the window.

"What d'ye mane?" said a voice in a threatening tone. "Hand 'em out at onst, or we'll come in and take 'em."

"I shall do nothing of the kind," replied Charley. "I give you three minutes to leave the premises, and if you don't clear out then we shall be driven to fire at you."

A yell was the reply from the men below, and as Charley stepped back into the room a bullet came crashing through the glass.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXXVIII.

WHAT a day they had. Lang was wild with joy, and completely astonished Soady, who was entirely ignorant of all that had passed.

"What's the excitement?" he asked. "You look as if you had come into a fortune."

"I'm going to sign the week after next," replied Lang.

"I never saw a fellow jump for joy at the thought of getting into harness before," remarked Soady. "I only wish I had your easy times. You must come up to my place the night you sign, and we'll have a jollification on the strength of it."

It had been no slight addition to Lang's recent anxieties that his father, seeing that he was recovered, had been pressing

forward the arrangements for his entering the office of Clarke, Clarke, and Cooper, a well-known firm of conveyancers. Fortunately the date fixed was subsequent to that of the announcement of the result of the examination. Now he could sign his articles with a clear conscience.

"There's a slight hitch," remarked Garland, when they were alone that evening. "Do they mention the date of the matriculation which you passed in the articles?"

Lang was startled. He had never thought of that point.

"We can get out of that," he said, after a moment's thought. "There is no reason why I need conceal that I went in in

June; they may perhaps suppose I wanted to try and pass higher."

"You must be careful to see the right date is inserted, if any date is necessary."

"I will."

They sat together a long time that night and had a talk which Lang remembered for many a day. From that evening he dated the turning-point in his life. But his troubles were as yet far from over. He did not know that Fanshawe was waiting for him to put his name to a false document in order to get him into his power.

Meantime Fanshawe was getting tired of waiting. He was in trouble—badly in debt. The extravagant habits he had acquired during the few months he had

had unlimited pocket-money were not easily shaken off. His creditors were getting troublesome.

"I only wish I knew when Lang was going to sign," he said to himself. "That precious illness of his has been the very mischief. Hallo! another bill!"

Not a bill only, but a letter with it. The amount in question was trifling—£2 10s. 8d.—but he had barely the 10s. 8d. in his possession, and he owed his land-lady four weeks' rent.

He whistled as he read the note.

"Now who can I borrow two pounds from?" he asked himself.

There was no reply; he had drained all his acquaintances.

"Bah! I'll try Lang. I'll see if I can't get it out of him by fair means or foul. What a sneak he is to fight shy of me now; after I've helped him out of his hole, too! Square are we, Master Lang? Not quite, yet."

He walked to Mrs. Turner's, where Lang still lived. He timed himself to arrive at half-past seven. Dinner would be just over, and he would be sure to catch Lang in.

The servant wanted to know his name when he asked if he could see Mr. Lang. He was left waiting in the hall. In a minute or two the boy returned with a message.

"Please, sir, Mr. Lang's engaged, and can't see you."

"Did you give him my name?"

"Oh, yes, sir."

Fanshawe had half a mind to go upstairs and force Lang to see him, but he controlled himself, and left the house.

"If I don't pay him out for this my name isn't Fanshawe," he muttered. "Thinks he's got rid of me, does he? He'll find out his mistake."

The necessity of raising money drew his thoughts from his revenge. The only way left him now was to pawn his watch. His studs, links, ebony stick, and so forth, had gone some time ago, but he still stuck to his watch and rings.

He obtained four pounds ten on his watch and chain, and then felt himself free from immediate danger. But it was very awkward to be without a watch, and he cursed his fate in being brought to such a pitch.

He wrote Lang a letter when he reached home—a letter in which he expressed himself freely as to his opinion of Lang's conduct, and let fall some hints that it would be much wiser for him to lend some money without obliging him to fall

back on other means than asking it as a favour.

Judge of his surprise and anger when two days later the letter was returned unopened, enclosed in an envelope addressed in Lang's hand. He dashed it on the floor and vowed that he would make him repent his conduct as long as he lived.

"He thinks he can make a fool of me," he cried; "but I'll show him he never made a greater mistake in his life. He thinks that I'm to do all his dirty work, and then be pitched aside like a worn-out tool. I'll teach him a lesson he'll never forget."

He would wait now, though. He could afford to be patient. He had heard through one of his fellow-clerks, whose brother was in Clarke, Clarke, and Cooper's, that Lang was to enter there, and that the articles were to be signed on the 30th of June. He waited till the 30th came, and then set off for Mrs. Turner's again at half-past seven o'clock.

"I want to see Mr. Lang," he said, imperiously, to the footboy.

"Please, sir, he isn't in."

"Don't tell me that, you young rascal; show me up this instant."

"But he *ain't* in, sir. He went out directly after dinner."

"Do you know where he's gone?"

"Mr. Soady came and called for him, sir."

"Oh, very well."

He set off for King Street. He was not sorry to hear that he should catch the two together. He owed Soady a heavy grudge on account of their last meeting. It would be a treat to show both of them that they were absolutely powerless.

It so happened that Garland had been prevented from coming early to King Street—he had promised to look in at nine. So Soady and Lang were alone when the servant came up to say that Mr. Fanshawe wanted to see Mr. Lang.

The two fellows looked at each other.

"Show him into the breakfast-room, Polly," said Soady.

"Very well, sir."

"Are you going to see him?" asked Soady, when the servant had gone.

"I don't want to, I've cut him; I've sent back his letters."

"You mustn't mind my asking, old man, but do you owe him any money?"

"No."

"Then, look here," said Soady; "you let me go down and get rid of him. I shan't stand any nonsense from him, you may be sure. Shall I go?"

"Yes," replied Lang, eagerly, "I should be awfully obliged."

Soady ran down to the little room in which he was allowed to receive visitors. Fanshawe was standing there with his hat on.

"What do you want?" demanded Soady.

"I want Lang."

"You can't see him."

"I shall."

"Take your hat off," said Soady. "If you can't behave decently you shan't stay in the house."

Fanshawe darted a quick glance at him and then took off his hat and put it on the table.

"You will talk more civilly in a minute or two," he remarked; "I may give you a lesson you won't easily forget."

"Never mind about all that," interrupted Soady; "the question is, have you a message for Lang? If so, give it, and then go, and don't ever presume to call at my house again."

"Your house?" sneered Fanshawe.

"I don't come here for the pleasure of seeing you, but because I wish to have a few words with my friend Lang. However, as he won't show himself, which is in very bad taste, I'll send a message by you, and mind you deliver it correctly."

Soady made a gesture of impatience.

"It's a very simple message, and won't tax even your powers. Tell him that unless I have ten pounds from him by to-morrow evening I shall write to—Well, never mind the rest, he will know well enough what I mean, and I won't put too great a strain on your memory."

Soady looked mystified.

"You won't forget it?" asked Fanshawe, with a smile.

"No, I shall not. Now go."

Fanshawe picked up his hat and began brushing it.

"I've no doubt he has friends who can help him if he hasn't the cash himself. You now look as if you were rolling in—"

His speech was interrupted by Soady's snatching his hat from his hand, opening the front door, and kicking the unoffending "chimney-pot" into the street.

"Now follow your hat," said Soady, in a voice that astonished himself; "and next time you come here you will go out of the door in the same way that your hat did."

Fanshawe gave him one look and then slunk out. What would he have not given to have been able to thrash Soady within an inch of his life!

(To be continued.)

THE HEROES OF NEW SWISHFORD:

A SCHOOL EPISODE IN FOUR CHAPTERS.

BY THE AUTHOR OF

"My First Football Match," etc., etc.

CHAPTER I.—CONSULTATION.

THE autumn term at Swishford School was more than half over, and boys were waking up to the hope that after all the Christmas holidays, which seemed such a way off six weeks ago, might yet arrive during their lifetime. It was already rumoured that Blunt, the captain, had been invited to spend Christ-

mas at Walkenshaw's, the mathematical Dux's, and every one knew how well Miss Walkenshaw and Blunt had "hit it" the last prize day, and prophecies were rife accordingly. More than that, Shanks, of the fifth, had whispered in the ear of one or two bosom friends, and thus into the ear of all Swishford,

that he was going into "swallows" this winter, and he had got down a book from town with instructions for self-measurement, and was mysteriously closeted in his own study every other evening with a tape. Other boys were beginning to "sit up" a little in the prospect of the coming examination, and

generally there was an air of expectation about the place which was prophetic of the coming event.

On the afternoon, however, on which my story opens, two boys as they walked arm-in-arm along the cliffs towards Raveling, appeared to be engrossed in consultation, which, to judge by their serious faces, had nothing to do with Christmas. Let me introduce them to the reader. The taller of the two is a fine, sturdy, square-shouldered youth of fifteen or thereabouts, whose name in a certain section of Swishford is a household word. He is Bowler, the cock of the

magnificent mountains and valleys and woods and bays, gorgeous fishing and hunting, oceans of fruit trees, everything a fellow could wish for, and not a soul on one of them."

"Rum," said Blunt, reflectively; "seems rather a waste of jolly islands that."

"Yes, but the thing is they're hundreds of miles away from inhabited islands, so no one ever sees them."

"Except your uncle. I wonder he wasn't tempted to get out and take possession of one."

"That's just exactly what he said he

sibly miss it. Do you see that town called Sinnamary (what a name, eh?), on the coast of South Africa. Well, don't you see the island's dead north from there as straight as ever you can go. All you want is a compass and a southerly breeze—and there you are, my boy."

"But what about currents and all that?" queried Bowler, who knew a little physical geography. "Doesn't the Gulf stream hang about somewhere there?"

"Very likely," said Gayford; "all the better for us too; for I fancy the island is on it, so if we once get into it we're bound to turn up right."

The Heroes in Council.

fourth, who in the football match against Raveling a fortnight ago picked up the ball at half back and ran clean through the enemy's ranks and got a touch-down, which Blunt himself acknowledged was as pretty a piece of running as he had seen in his time. Ever since then Bowler has been the idol of the lower school.

His companion is a more delicate-looking boy, of about the same age, with a cheery face, and by no means unpleasant to look at. He is Gayford, as great a favourite in his way as Bowler, a boy whom nobody dislikes and whom not a few, especially Bowler, like very much.

These are the two who walked that afternoon towards Raveling.

"Are you sure the fellow in the book doesn't make it all up?" said Bowler, dubiously.

"Not a bit of it," replied his companion. "My uncle's a captain, you know, and he says there are hundreds of islands like it, the jolliest places you ever saw, any amount of food, no wild animals, splendid weather all the year round.

was tempted to do," replied Gayford, stopping short excitedly. "He said very little would have tempted him to do it, Bowler."

"Oh!" was Bowler's only reply.

"And I tell you another thing," continued Gayford, "he gave me an old chart with the identical island he saw marked on it, and I've got it in my box, my boy."

"Have you, though," said Bowler. "I'd like to have a look at it."

That evening the two boys held a solemn consultation in their study over Captain Gayford's chart, and Gayford triumphantly pointed out the little island to his friend.

"There he is," said he; "he doesn't look a big one there, but he's eight or ten miles across, my uncle says."

"That seems a fair size—but, I say," said Bowler, "how about getting there? How could any one find it out?"

Gayford laughed.

"You're coming round, then," said he; "why, you old noodle, you couldn't pos-

sibly miss it. Do you see that town called Sinnamary (what a name, eh?), on the coast of South Africa. Well, don't you see the island's dead north from there as straight as ever you can go. All you want is a compass and a southerly breeze—and there you are, my boy."

"Oh, of course. But, I say, old man, what do you say?"

"Well," said Bowler, digging his hands into his pockets and taking another survey of the chart, "I'm rather game, do you know?"

"Hurrah!" said Gayford. "I know we shall be all right if we get you."

"Who do you mean by we?" asked Bowler.

"Ah, that's another point. I haven't mentioned it to any one yet; but we should want about half a dozen fellows, you know."

"Don't have Burton," said Bowler.

"Rather not; nor Wragg—but what do you say to Wallas?"

"He's muffed quarter back rather this term, but I dare say he might do for one."

"Well then, what about Braintree?"

"Too big a swell," said Bowler.

"But he's got a rifle at home."

"Oh, ah! all serene. Stick him down."
 "What do you say to having them in and talking it over before we ask any one else?"

This prudent proposition was agreed to, an extra spoonful of tea was put in the pot, and Gayford went out and conducted his guests in personally.

"The fact is," said Gayford, after having delicately disclosed the scheme on hand, and roused his hearers to a pitch of uncomfortable curiosity, "the fact is Bowler and I thought you two fellows might like to join us."

"You'll have to wait till the spring," said Wallas, a somewhat dismal-looking specimen of humanity. "I've got my Oxford local in January."

"Oh, of course we shouldn't start till after that," said Gayford, ready to smooth away all obstacles.

"Warthah hot, won't it be?" said Braintree, looking at the map.

"No, I believe not," said Gayford; "there's something about the Gulf stream, you know, keeps it fresh."

"Wum idea calling an island fwesh," said Braintree, giggling.

"It'll be a fresh start for it when we take possession of it, anyhow," said Bowler. "Of course you'll bring your rifle, Braintree?"

"Warthah," replied Braintree, "in case of niggers or wobbers."

"Hope we shan't quarrel when we get out," said Wallas. "That's the way these things generally end."

"Bosh!" said Bowler, "there's no chance of that—just like you, throwing cold water on everything, Wallas."

"If you call what I say bosh," said Wallas, warmly, "it's a pity you asked me to join you."

It took some time to get over this little breeze and restore the party to

good humour. This was, however, accomplished in time, and the consultation continued.

"We ought to have three more fellows at least," said Bowler. "I tell you what, each of you pick one. Who do you say, Gay?"

"Well, I fancy young Wester might do," said Gayford.

"Warthah a pwig, isn't he?" suggested Braintree.

"He is a little," replied Gayford, "but he's very obliging, and fags rather well."

"All serene. Now then, Wallas, who's your man?" asked Bowler.

"Tubbs," said Wallas. Tubbs was one of the most hopeless louts at Swishford.

Gayford gave a low whistle; but he was too anxious to preserve the harmony of the party to offer any objection.

"Now you, Braintree?"

"I say, Cwashford. Jolly fellow, and knows French, too."

"Ah, but he is such a cad," said Bowler, imploringly.

"Couldn't you think of somebody else, Braintree?" asked Gayford.

"Oh, have Cwashford. He's a wewy decent fellah. I like Cwashford, you know."

"Well, there's this to be said," remarked Bowler, finding there was no getting out of it, "it may be rather a good thing to have some one to keep in order; it will give us something to do."

"Yes, I expect you'll want it," said Wallas. "My opinion is it will be jolly slow out there."

"Not a bit of it. We shall have to go out every day and shoot our game—"

"With my wife," put in Braintree.

"And then there'll be a log hut to build and the whole place to explore, and lots of bathing and boating."

"And no lessons to do at night."

"And we can get up concerts and penny readings, you know, for the winter evenings."

"And needn't get up till half-past nine in the morning."

And so they went on till gradually the prospect became so delightful that even Wallas warmed up to it and expressed a wish that they could start at once.

It was, however, decided that they could not manage it this term, as they would have to spend Christmas at home and provide themselves with necessaries for their journey. As to the means of getting out as far as Sinnamary, at any rate they had no anxiety on that score, for Captain Gayford, when he once heard the object of their expedition, would be sure to take them on one of his ships, and possibly afford them much valuable information as to their further route into the bargain.

Before the council broke up one solemn and momentous step was taken.

"What shall we call our island?" asked Bowler, dramatically, placing his finger on the map and looking round on his fellow-adventurers.

There was a pause, and for a moment the founders of the new empire were wrapped in silent thought. At last Gayford said,

"I know—just the thing."

"What? What? What?" inquired three voices.

"New Swishford."

It is hardly needful to add that the name was there and then duly appended to the island on the chart in red ink, which done the company separated to sleep, and heard all night long in their dreams the crack of Braintree's "wife" echoing among the waving woods and fertile valleys of New Swishford.

(To be continued.)

HEROES OF THE BACKWOODS.

III.—WILLIAM STARK.

BEFORE we conclude these articles on the Scouts, it may be well to say a few words as to what they did and what

they did not. It was not the business of the Rangers to fight pitched battles. Their drill and discipline were such as to fit them best for bush fighting and partisan warfare. They cleared the way for the regulars, and protected them from surprise; and when their special work was done, joined in the combats

almost as supernumeraries. In their two principal battles, which we have now described, they were crushed by overwhelming odds; but in the smaller encounters they were generally successful, and party after party penetrated the enemy's lines, and brought the news from blockhouse to blockhouse, which eventually turned the tide of war in favour of the British. Artful and enduring as were the Redskins and Voyageurs, they were no match for the New England trappers, who took to scouting as if they were born to it, and rejoiced in the opportunity of clearing the country of the Indians, who spoiled their sport, and the Frenchmen, who crippled their trade.

The organisation of the Rangers was more elaborate than would at first sight appear, and the instructions as to their drill and conduct, which still exist, give many interesting particulars concerning it. They were armed with rifle and tomahawk, and when ordered out to the enemy's forts or frontiers, advanced in single file and at such a distance from each other as to prevent one shot from killing two men. Where the ground permitted one man was sent on in front, and one took charge of each flank.

When the march lay through marshes, the advance was made in line, to throw the enemy off the track. They never encamped till after dark, and then always did so in such a position as to afford an opportunity of seeing or hearing the enemy from a considerable distance. The camp was always

reconnoitred by two men sent on in front for the purpose. They were instructed never to return by the same route they took in order to avoid surprise; and the neglect of this precaution led to the defeats of Rogers we have already described.

The devices for the avoidance of ambuscades were elaborate, as were also those against being surrounded by superior forces. If compelled to receive an enemy's fire they fell down till it was over, and then rose and shot with careful aim. In most fights they advanced from tree to tree, one half of the party ten or twelve yards in advance of the other. As soon as the leaders fired they fell to reload, while the followers fired over their heads. The great object in the fights was to prevent the enemy gaining hills and rallying to repulse them, and this was always carefully attended to.

Every morning the meeting-place for the evening was agreed upon; and, in the event of attack from superior forces, the Rangers when possible dispersed, and made off in different directions, to meet again at night. The sentinels round the camp were never relieved till morning; and in the event of their seeing or hearing anything they did not give the alarm in the usual manner, but silently retreated to the commanding officer and informed him. At dawn all were awake, owing to its being the favourable time for savages to attack.

If the scouts discovered the enemy in force during the day, the attack was if possible

reserved till nightfall, in order that their numbers might be over-estimated, and that they might make good their retreat if they got the worst of it. Every morning the vicinity of the camp was searched for the trail of an enemy's spy; and whenever a halt was made at a spring the party was posted so as to avoid surprise, and the path was ambushed so as to intercept pursuers. In returning from a scout the usual fords were avoided, lest the enemy should have ambushed them; and on lakes the Rangers always kept at a distance from the shore, to avoid a similar fate.

When pursued from the rear their orders were to make a circuit until they came to their first tracks; and then form an ambush and give the first fire; and when returning from scouting, and approaching forts, they never used the roads and avenues, but struck out a path for themselves lest the enemy should be in ambush to receive them when almost exhausted with fatigue. When pursuing a party they never followed on directly, but did so by a different route, and ambushed in some narrow ravine, greeted them when least expected.

Water journeys were always begun at night, and the canoes kept each other in sight, following in single file. The look-outs were always numerous; one in each boat was told off to watch the enemy's fires, so that an estimate could be formed of the enemy's numbers. When the enemy were found on the banks of a river or lake which they were likely to attempt to cross if attacked, a detachment was always dispatched in the first instance to the opposite shore to welcome them when they arrived.

When the enemy's force could not be made out from the fires, their numbers were ascertained by a reconnoitring expedition. In all river voyages it was customary to lie concealed with the canoes all day without noise and show, and in all cases parole and countersigns were given out for mutual recognition in the dark, and a meeting-place agreed upon in case of accident.

In short, the Rangers were specially trained as a corps independently of the line of the army, under their own officers and regulations, to reconnoitre hostile posts and armies, surprise straggling parties, obtain prisoners, effect diversions by false attacks, and act as guides and couriers. And, under the circumstances, it is hardly to be wondered at that there fell to them an ample share of hardship and adventure.

Old Archibald Stark had four sons—William, John, Archibald, and Samuel. All four were in the Rangers. John rose to be a general of the Revolutionary War, as we have seen. William became a captain of the Rangers, and was in command of them at the taking of Quebec; and when the revolt of the colonies took place, joined the British service, and died a colonel on Long Island. Archibald Stark rose to be a lieutenant, and lived till he was ninety.

Of William Stark's escape from the St. Francis Indians we have already told. The St. Francis tribe had about forty wigwams near the lake of the same name. They captured John Stark and Eastman, as we have seen, and another capture of theirs was that of Thomas Ames, who was tried by them on a charge of robbing their camps of furs. The result was an unexpected one.

He was tried by their council, the sachem and his old men sitting in front, with the squaws behind them to keep the record of the proceedings.

Nothing being found against Ames, he was acquitted, and the chief told the court he must be compensated, whereupon a birch bucket was passed round, and each one put into it a piece of money as damages for false imprisonment. After this Ames was ordered to wrestle with the young men, and he managed to throw them all, and make their falls tolerably hard ones, much to the delight of the old men, who

seemed to have gloried in seeing the conceit taken out of the young bucks.

The sachem treated Ames very handsomely, and kept him at night in his own wigwam, where he slept on a down bed, the sheets of which were made of silk handkerchiefs sewn together. These St. Francis Indians were "converted," and had a chapel amongst their wigwams, and a French curé used to welcome them back from their expeditions.

Shortly afterwards they behaved very badly to Captain Kennedy, who had been sent to them with a flag of truce, and then General Amherst ordered Rogers to lead a detachment of the Rangers against them. This he did, and the tribe suffered considerably.

But we must hasten on to William Stark, whose fate it was to become closely connected with Amherst and Wolfe, and to take the opposite side to his brothers in the War of Independence, which was soon to break out. He had been in all the important encounters we have hitherto mentioned, and at the fall of Ticonderoga, in 1759, took a distinguished part.

The Rangers began work from the north end of Lake George, scouted across the mountains on the isthmus, and thence made their way through the woods to the heights. On July 23rd the general advance was ordered, and the guns from the fortress opened fire. For the next two days the Engineers were busy with their batteries and fascines, and during this time the Rangers scoured the country up to Crown Point.

Across the lake the French had thrown a boom, and sixty of the Rangers were told off to silently saw it in two. They started in two whaleboats, and steered along the eastern shore, when at nine o'clock at night, just as they had reached their destination, the French, who had undermined the fortress, sprung their mines with a tremendous explosion, and betook themselves to their boats. This gave the Rangers an opportunity of attacking to advantage, and a desperate fight took place on the water all through the night, and by the morning ten of the enemy's boats had been captured, with a large quantity of baggage, fifty barrels of powder, and a quantity of shot and shell.

The French made good their retreat, and five days afterwards cleared out from Crown Point to Ile aux Noix. The plan devised by Pitt for the conquest of America had been entered upon. The whole of Canada had been called to arms, for the combined movement of Amherst and Wolfe had begun, and Montcalm wanted every man he could muster to defend his frontier line.

Ticonderoga had fallen as it always fell, without an assault. Years afterwards, on the 18th of March, 1775, it became the first fort to fly the flag of American Independence. Its commandant was awakened in the middle of night to find Allen standing over him with a drawn sword and calling on him to surrender. "To whom, and in whose name?" "In the name of the Great Jehovah, of the Continental Congress, and of Ethan Allen!"

Stark hurried off with a few of the Rangers to place himself under the orders of General Wolfe, who had landed at Louisbourg. It was from Louisbourg that the expedition against Quebec began. The destination of the troops was kept secret, and no man knew the object of the journey—to storm the heights of Abraham.

It was the 13th of September, 1759, and a cold, starlight night. Thirty boats moved silently away, with sixteen hundred men. A feint attack was made lower down the river, and Montcalm's attention drawn from the real danger.

As the leading boat passed the French sentry the challenge was answered in French by one of the Highland captains, and the enemy's sense of security left undisturbed. The troops landed at the foot of the cliffs and began their perilous ascent. Soon they reached the top. The captain of the guard

resisted and was overpowered, and the alarm went off to Montcalm, who was expecting the assault on the other side of the city.

Meanwhile, the boats having landed their men, returned for more, and worked backwards and forwards, until at last there were 4,828 British troops on the heights to contend with 7,520 French. Wolfe had succeeded in getting only one cannon dragged up into position.

At eight o'clock, as soon as the morning mist cleared off, the battle that decided the fate of America began. The French made a tremendous rush to "drive the English into the river." They were met with disheartening coolness, and scattered back. Again Montcalm sent on his men, and again they were brushed off; and then, as they broke, the Highlanders sprang out "like cavalry," and swung down on them, claymore in hand. The fight became a rout. The French were hurled off the field. Montcalm received his mortal wound as he was retreating.

Wolfe had been shot early in the action. A ball struck him in the wrist, then another ball buried itself in his body, then another.

"Support me that my brave fellows may not see me fall." "They run." "Who run?" "The French." "Thank God!"

He gave a few orders, and then said, "Now God be praised! I will die in peace!"

And he died—the hero and the victor of one of the decisive battles of this world.

In the well-known picture of his death there is a group of officers. One of them is William Stark the Ranger.

RECENT ATHLETICS.

His retirement of Mr. W. G. George, which has just been announced, will render the past season a memorable one in athletic history. During its continuance the running records were changed for the better no less than seventeen times, and of these changes Mr. George claimed twelve.

His career has been a brilliant one. To say nothing of his successes all over the

kingdom, he stands in the lists as holding the half-mile championship in 1882 and 1884, the mile championship in 1880, 1882, and 1884, the four miles championship in 1880, 1882, and 1884, and the ten miles championship in 1882 and 1884; in addition to which he now holds the record at all distances from three-quarters of a mile up to eleven miles. With the exception of the three-quarter record of 3min. 8 $\frac{3}{4}$ sec. scored at Lillie Bridge in 1882, and the 5min. 44sec. for the mile and a quarter, and the 6min. 57 $\frac{1}{2}$ sec. for the mile and a half gained during the same year at Lillie Bridge, all these records were made in 1884, and excepting the Birmingham mile in 4min. 18 $\frac{1}{2}$ sec., all on the Stamford Bridge path—the 51min. 20sec. for the ten miles, and the 46min. 12sec. for the nine miles on April 7; the 8min. 8 $\frac{1}{2}$ sec. for the mile and three-quarters, and 9min. 17 $\frac{1}{2}$ sec. for the two miles on April 26; the 14min. 39sec. for the three miles, and the 19min. 39 $\frac{1}{2}$ sec. for the four miles on May 17; and the 25min. 7 $\frac{1}{2}$ sec., 30min. 21 $\frac{1}{2}$ sec., 35min. 37sec., 40min. 57 $\frac{1}{2}$ sec., and 57min. 9 $\frac{1}{2}$ sec. for the five, six, seven, eight, and eleven miles respectively on July 28. It was on this last occasion that he attempted to beat the Deerfoot performance, and ran 11 miles 932 yards within the hour, a truly remarkable performance.

When the amateur championships began in 1866, the mile time was 4min. 39sec., and that of the four miles 21min. 41sec., so that Mr. George's performances give a gain on the mile of 20½ sec., and on the four miles of 41½ sec. The championship performances may not be the best we have, but they afford a very fair basis for comparison. Perhaps a few notes on the holders of championship honours in these later days may not be unwelcome.

The hundred yards, then, has been run for nineteen times. It has been won twice by J. M. Cowie, and three times fell to the lamented W. P. Phillips. In 1869 and 1871 it was won by J. G. Wilson, of Oxford, in 1873 and 1875 by J. Potter, of Manchester. Of the single-year men we have Colmore, Ridley, Tennant, Baker, Dawson, Davies, M. Shearman, Macdougall, Junker, and Portal. Of these none have done the distance in "evens," six are credited with the mystic 10½ sec., and the others have the ten and varying fractions.

The time for the quarter mile 55sec. required by Ridley in 1866 was reduced to 49½ sec. by Myers at Birmingham in 1881, and for that performance he now holds the record. Ridley won the quarter mile twice, Upcher won it three times, and so did Elborough. Colbeck won it twice, once in 50½ sec., the best time till that of Myers; Cowie has also won it twice, last year in the same time as Colbeck's best. The other quarter mile champions have been Philpot, Templar, J. Shearman, Story, M. Shearman, and Ball, the latter credited with 50½ sec., and being the best among the Englishmen.

The record for the half mile is now claimed by Myers with 1min. 55½ sec.; the slowest championship time is Frere's 2min. 10sec. The first champion half-miler was P. M. Thornton with 2min. 5sec., the last is George with 2min. 2½ sec. George has won it twice, so have R. V. Smith, Pelham, Sandford, and Elborough; the other winners have been Colbeck, Christie, and Templar—a dead heat—Whately, Bolton, Holman, S. H. Baker, and Birkett.

In 1869 Chinnery's mile in 4min. 50sec. gave him the championship; in 1884 George carried it off in 4min. 18½ sec. Walter Slade won the mile championship five times successively; Chinnery won it three times; George has won it three times; Wise won it twice. The other mile winners have been Lawes, Scott, Benson, Mason, Hills, and Snook.

The four miles championship gives us a longer list. George won it three times, Gibb won it three times, Chinnery won it twice. It was first won by Garnett with 21min. 41sec.; the worst time was Kennedy's in 1867, 22min. 13sec. The other four miles champions have been Riches, Scott, Edgar, Somerville, Slade, Goodwin, Warburton, Nehan, and Snook.

The ten miles championship has a shorter history. It was first run in 1880, and then won by Mason in 56min. 7sec.; the next year it was won by Dunning; in 1882 and 1884 it was won by George, and in 1883 by Snook, who in that year carried off the championship in the mile, the four miles, and the ten.

We have gone so fully into these running times that we may as well complete the list. The record for 120 yards, 150 yards, and 220 yards still belongs to W. P. Phillips, the first being 11½ sec., the second 15sec., and the third 22½ sec. Myers claims the 130 yards, the 200 yards, the 300 yards, 350 yards, 400 yards, 500 yards, 600 yards, 700 yards, 800 yards, and 1,000 yards, the times being 13½ sec., 20½ sec., 31½ sec., 36½ sec., 43½ sec., 58sec., 1min. 11½ sec., 1min. 31sec., 1min. 44½ sec., and 2min. 13sec. Then follows George, with the fifteen records from three-quarters to eleven miles we have already given. At twelve miles Dunning takes up the record with 1h. 6min. 33sec., and he holds it all the way up to twenty-five miles, with 2h. 33min. 44sec. Stenning comes in at

twenty-six miles with 2h. 56min. 8sec., and runs on to thirty-two in 3h. 39min. 33sec. Dunning breaks in for thirty-three and thirty-four; Stenning takes the thirty-five with 4h. 8min. 5sec.; then Dunning displaces him till forty in 4h. 50min. 12sec.; Stenning takes forty-one and forty-two; Dunning breaks in again up to forty-nine; and Firminger retains the fifty with 6h. 38min. 41sec. Records above fifty miles do not go for much; those up to eighty-one are held by Davis. Sinclair follows up to ninety; and Saunders (the American) completes the list up to one hundred and twenty, his time for which was 22h. 47min. 23sec.

There are, however, other champions worthy of notice besides the runners. There are the hurdle-racers, the high-jumpers, the wide-jumpers, the pole-jumpers, the hammer-throwers, and the weight-putters.

(To be concluded.)

BATTLE BETWEEN AN EAGLE AND A STAG.

A Strathglass correspondent has lately described a singular struggle witnessed on the lower portion of Corrie-Mor between a large and powerful eagle and a finely-antlered stag. The king of birds was watched for some time as he hovered about on high above a herd of deer, which appeared to have particular attractions for him. He slowly and majestically sailed around in his aerial circles, by degrees getting nearer to his coveted quarry. At last reaching striking distance, he suddenly came to a halt in mid-air, and, poising himself on outspread wings, he seemed for a few seconds perfectly motionless. Then, like a bullet from a rifle, he swooped down, and in an instant his powerful talons were firmly fixed in the back of a fine large stag. The monarch of the glen plunged about in the wildest possible manner, evidently in great terror and pain, the eagle holding on grimly, belabouring the stag's sides all the while with heavy blows from his wings, and, when opportunity offered, making desperate darts with his beak at the eyes of the frightened deer. By this time the poor stag's brown sides were red and gory, and, notwithstanding his frantic efforts, he could not disengage himself from his strong and cruel foe. At last, seeming to discover that his antlers could reach his savage enemy, he commenced

raking fore and aft with them in the most vigorous manner until he managed to send the eagle sprawling in the heather. The stag had gallantly freed himself; but he had not bounded far when his fierce assailant, recovering from his discomfiture, was again on the wing, and in full chase, and in a few seconds down he came again, and firmly fixed his powerful claws in the deer's haunches, so far back as to be out of reach of the antlers. Again the struggle was renewed, the eagle meanwhile tearing at the victim's flesh with his strong bill, and burying his talons still deeper into his haunches. The poor stag was now very much exhausted, and was evidently getting the worst of it, as he could not touch the eagle with his antlers. At this juncture, as if in despair, the stag commenced to tumble about, throwing himself on the ground and rolling over down hill, but still the eagle seemed incapable of letting go its tenacious grip. The stag then put his head down between his fore-legs, throwing himself clean over, heels over head, several times. The stag's efforts were at last successful, and, getting clear of his murderous enemy, he galloped off. The eagle was, however, speedily up again and in full chase; but his intended victim made his escape sure by rushing full speed down the hill into the Glassburn woods. The eagle, rather ruffled in his plumage, and no doubt much ruffled in his temper, soared aloft to look for his dinner elsewhere.

HEROIC SELF-SACRIFICE.

The name of Regulus has always been honoured as the type of highest heroism and noblest self-sacrifice. No conduct more heroic than his appears in the story of old Rome, or in all classical history. Taken prisoner by the Carthaginians, he was sent to the Roman Senate with proposals of peace, being made to take an oath that he would return. He went, and instead of counselling peace he advised his countrymen to refuse the terms which he brought. He knew the consequences to himself, and although entreated not to return to Carthage, where death by torture awaited him, he had respect to his oath and his word of honour,

Atqui sciebat quæ sibi barbarus
Tortor pararet.

Horace, in one of the finest of his patriotic odes, celebrates this deed of *vera virtus*, the loftiest example in Roman annals of noble manhood and unselfish heroism.

The conduct of General Gordon in the last days of the siege of Khartoum displays a heroism as unselfish and virtue as pure as that of Regulus. Wonderful as his story is from first to last, this act of Gordon in refusing to leave the beleaguered town will be remembered as the noblest deed of all. When he heard of the approach of Lord Wolseley for his relief, and the long agony of suspense and peril seemed about to end, he sent steamers, with some hundreds of men, to meet the English troops at Metemneh. Why did he not himself go in these boats? The main object of the expedition was to rescue Gordon. Here was the way open for his escape from imprisonment or death. Why did he not avail himself of it? He had taken no oath like Regulus. But his soldierly honour and his Christian duty forbade him to leave those who had trusted him, although he knew not who around him were friends or traitors. By this act alone he has won undying fame. By this act of self-sacrifice he upheld the honour of his country, and gave new lustre to a reputation "above all Greek, above all Roman fame."

CHRIST, and Christ only, has revealed that he who has erred may be restored, and made pure and clean and whole again.—Robertson.

JOE.—The series of articles on model steam-engine building was in the third volume. All the volumes are kept reprinted.

TRIMPLAR.—It is not a question of "being supposed to agree" at all. Refer to the cricket laws. In no good match has a substitute ever acted as wicket-keeper or bowler.

GROSVENOR.—You can hardly expect us to know more about the journal than its own editor. Take his advice, and consult the indices, which is confessedly a laborious task. A visit to the office would enable you to overhaul the file copy. It is sufficient for us to have put you on the right track.

T. BAKER.—Such patent processes for decorative purposes have generally a very brief existence, and are valuable only as amusements.

FIFE.—Could not the teacher of the Science Classes advise you? You will have to be articulated, and pay a nominal premium. See the "Architect," the "Builder," the "Building News," etc.

G. DIXON.—A bowler can bowl underhand, or overhand, or round, or over the wicket, just as he likes.

T. Y.—The largest single advertisement in the world is said to be the annual printing of the list of delinquent taxpayers in Cook County, Illinois. According to a special enactment, those who fail to pay their taxes in that county have to have "their names in alphabetical order published in the public press," and this is met by inserting them once as an advertisement in the "Chicago Tribune." The list extends to six hundred and sixteen columns, and costs over three thousand pounds!

C. E. L.—The "council of the earthquake" was the tribunal presided over by Courtenay, Bishop of London, before which Wycliffe was tried.

JOLLY BOAT.—1. The dock companies charge three guineas per year for yachts under twenty-five tons. The "weekly rates" for short periods are three-pence per ton for docking and undocking, and one penny per ton per week rent, with a minimum charge of ten shillings. The yearly rates have to be paid in advance. 2. You can estimate the cost of an eight-oar at sixty pounds; four oars cost about thirty-five pounds, pairs twenty-two pounds, skiffs fifteen pounds. A properly-fitted pair-oared gig would cost three-and-twenty pounds or thereabouts.

R. C. C.—The Canadian Pacific route is the shortest. The termini are at Montreal and Port Moody, and the length of the main line is 2,893 miles. From New York to San Francisco is 3,331 miles; from Liverpool to Montreal is 3,043 miles; to New York it is 3,431 miles; to Port Moody 5,941 miles; to San Francisco 6,762 miles. By the Canadian Pacific route the distance from Liverpool to Yokohama is 10,977 miles; by the San Francisco route it is 11,990 miles.

BLOOMER.—1. Mignonette is a poetical name, for Mignon is "darling," and Mignonette "little darling;" the other, zinnia, is derived from Zinn, a botanist who died in 1758. 2. Organette, orchestron, etc., etc., are different names for the same sort of instrument. They are worked on the perforated paper principle, described in our article on the "Boy's Own Penny Whistle" in last volume. 3. For a brief "history of a bill of exchange, and what happens to it," see the "Bijou Calculator," published by F. Warne and Co., Bedford Street, Strand.

CRNER MAN.—1. Mix burnt cork with beer. That will make it stick on and wash off easily. 2. A "corner" is a clique speculating in some particular stock or commodity, and whose operations are conducted with a view to profit by the embarrassment thereby occasioned to everybody else.

T. OWEN.—The Government Annuity tables are published in the sixpenny official Postal Guide, obtainable from any post-office.

W. B. C.—Then buy an index, price three-halfpence post free to your address, from Mr. Tarn, 56, Paternoster Row, and look it out for yourself.

ASPARAGUS (Cairo).—Perhaps if you were to begin with your own country first, and learn its history thoroughly, it would not be a bad plan. As regards the "good history book containing in detail the history of all the nations," perhaps as soon as you have found it, and read it through, you will let us know.

ANXIOUS.—You will find a paper on balloon gores in the third volume.

T. CUMMINGS (Roorkee).—You can enter the Literary Competitions whenever you please, and take your chance with the other readers, but your compositions are no use to us. You will stand very little chance in the competitions unless you improve your spelling.

PUPPY.—The stamp is Belgian. Surely you could recognise the "Lion of Brabant"!

AN OLD SUBSCRIBER (Co. Down).—"How to Make a Pantagraph" for enlarging maps and drawings was in the September part for 1883.

GRENADIER.—You will find a coloured plate of the uniforms of the British army in the second volume—July, part, 1880.

LEIGL.—"Calm" and "Storm" were in No. 128 in the July part, 1881—the one in which were the Volunteer uniforms.

MERNO.—"Astore" or "asthore" means "darling," and A E I "for ever."

P. HAZETTON.—The fact of the balls being off makes no difference. If the man had not got into his ground before the stumps were struck by the ball, he was out. Read the cricket laws, or refer to Dr. Grace's commentary on them in the second volume.

JACQUES THE ENQUIRER.—The boots squeak because the leather inside is too dry. To prevent them squeaking, stand them in a plate in which you have poured a little castor-oil, and leave there for a night. In the morning the thirsty soles will have drunk the draught and subsided into silence.

W. SMITH.—1. It never pays to buy tools to make one special thing. You should buy them to be of use for other purposes as well; and your best plan would be to get a set suited for ordinary carpentering repairs, adding a few gouges and Bradaws for model-making. A few good tools are better than many bad ones; and it is far better to get the tools first, and make the box for them, than to buy a box ready fitted, as in the majority of instances half the tools given in the box are useless. For model-yacht making you would find the following list a very full one—Chisels: inch and a half, inch and a quarter, and half inch; gouges: inch and a half, inch and a quarter, and half inch; saws: hand-saw, tenon, small sweep, and keyhole; planes: jack trying, and smoothing; spokeshave; screwdrivers: three-eighths and eighth; hammers: a light one and a miniature one; rasps: a rough-wood and a finer one; files: a half-round and a quarter-inch round; Bradaws: half a dozen, from an eighth to a needle; set squares; pinners; small flat pliers, round pliers, and nippers; brace and bits; and of course a bench. A list enough to frighten you! And to it you should add a pair of tinman's shears and a six-pound ladle. 2. No.

F. HOOTON.—The man who was caught was out; the man who was stumped was not out, for the ball had ceased to be in play. As soon as a man is out the ball is dead; and hence it is impossible for two wickets to fall without a ball being bowled between whiles.

SILFAX.—1. Apply for list of the practical books published at 170, Strand by L. U. Gill. 2. There is no special popular book on owls. 3. The cheapest edition of the "Decline and Fall of the Roman Empire" is that published by F. Warne and Co., Bedford Street, Strand. It costs eight shillings, is in four volumes, and has a very full index. It forms one of the Chandos Library series.

T. B. A.—Without exception all the Bayern stamps are Bavarian, and none are local.

E. G. L.—"The Pied Piper of Hamelin" is by Robert Browning. "The Song of Hiawatha" is by Longfellow. You will find them in any collected edition of their works.

W. FULLER.—Apply for forms and all information to the Commissioner, Metropolitan Police Office, Great Scotland Yard, S.W.

G. A. A.—1. On the bathing-pond at Victoria Park. 2. If you mean a square-header, have a hook on the boom and fix it into an eye on the topmast; if a jib-header, have a hook at the top and hook it up in the same way. In each case hook on to a ring or loop in the gaff end, and bring the sheet down the side of the mast to tighten by cleat or euchary. Halliards are unnecessary. Strong pins will do for your hooks and eyes. Bend them up with a pair of round-nosed pliers, which will cost you ninepence.

TOTA.—Give the bust a coat of thin size. Then give it a coat of gold-size. Then dust it over with bronze. Then varnish it with the best copal.

F. H.—The value of all curiosities is simply what you can get for them, and you only hear of extraordinary prices owing to ordinary ones being not thought worthy of mention. It is with Mulready envelopes as with everything else—you may get them for a guinea, or for a shilling, or for nothing.

A. C. I.—A very simple hard stopping for wood is made by working up together whitelead and whiting.

LIBER.—1. You will find articles on Bookbinding, with lists of the necessary tools, in the second volume of "Amateur Work," published by Ward, Lock, and Co. 2. A handy case for periodicals is made by taking a piece of thin wood, such as the lid of a cigar-box, and cutting it to the size of the page, and then fixing on to it with hinges a strip the width of the back of the volume when complete. The numbers of the magazines are slipped into indiarubber rings which are passed over the wooden back. You can buy an ordinary clip bill-file the size you want from most office stationers.

DEAD POLISH.—Dissolve a pound of beeswax and two ounces of resin in turpentine, and add to it half an ounce of benzoin dissolved in half a pint of methylated spirits. The mixture will not be very good, but shake the bottle before you apply it to the wood.

C. B. B. P.—1. Carriage panels are so perfectly painted owing to so many coats being used and sandpapered off before the final varnish. 2. Montreal is really a French word, and the modification of the French pronunciation gives it the sound you think erroneous.

A. SCUDAMORE.—Praxinoscopes or zoetropes are on sale at Perry's, on Holborn Viaduct, and at almost every optician's and first-class toyshops. Try the Lowther Arcade.

S. H. W.—For the best book on Canadian farming apply for information to the Emigration Offices for Canada.

AN IRISHMAN.—1. The dimensions you give, twenty-four inches long by six beam and seven depth, should give you a serviceable boat if in the seven inches you count the keel. 2. Such guinea cameras are advertised, but we cannot speak practically as to their merits. 3. You can get a set of soldering tools on a card for one shilling.

R. A. T.—The article on "How to Make a Pantagraph" was on page 751 in the fifth volume. You will find it in the September part for 1883.

D. McLAREN.—Try Mr. Pycroft's "Cricket Field," obtainable from all cricket outfitters. The most practical treatise was that by Dr. W. G. Grace in our second volume.

COCK ROBIN.—The tops of trees are often dwarfed by the prevailing wind. The trees grow healthily where sheltered, and as soon as they rise above the shelter, are nipped off as if some one had been lopping them. This may account for the appearance you mention.

A. M.—See any biographical dictionary or encyclopedia, and make a note of the authorities given at the foot of the article. Chesterfield's Life and Letters have been frequently published.

JUMBO.—To raise the bow of a boat shift her weights farther aft. For steam whistles apply to some model maker, such as Bateman or the Model Dockyards.

ARTHUR, J. S.—The plans of particular engines are not printed for special sale, but you can occasionally meet with them in such papers as the "Engineer," "Engineering," etc., or in treatises on the steam-engine.

H. J. S.—1. Sulphuric acid is oil of vitriol, and it is chiefly made out of iron pyrites. 2. You mean stalemate, the meaning of which has been frequently given. 3. The Orit Line to Australia is well known. For terms apply to Anderson, Anderson, and Co. Average passage, second-class, will cost you about fifty pounds. 4. You will find it best to learn a trade whether you stay at home or go abroad.

A WOULD-BE BICYCLIST.—You will find practice-grounds and schools advertised in all the cycling papers; or any of the makers will give you information as to one in your neighbourhood. You can also get a list from Goy, Leadenhall Street.

No. 323.—Vol. VII.

SATURDAY, MARCH 21, 1885.

Price One Penny.

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science.

Author of "Harold, the Boy Earl," etc.

CHAPTER XIV.—THE ENGLISH CHURCH AT MOSCOW.

At the time of which we are writing the present elegant church in the Tschernestcheffskie Peryoulok was not built. The worship of the English inhabitants of Moscow was carried on in a curious structure not originally intended for any such solemn purpose. It was a long, low, rambling place, in a yard, through which the church was entered.

"Very grave charges."

The house was divided by the entrance hall or lobby, which was exactly in the centre of the building, into two equal parts, one of which was devoted to the private accommodation of the chaplain and the other formed the church. It was nothing but a large oblong room, with an excellent organ at one end and the altar at the other. The seats were arranged to create a most church-like effect, and the Law and the Belief being in English, sent a happy thrill through the heart of Edward Tenterton on the first occasion of his presenting himself at public worship one fine Sunday late in October. After church he stopped to see the chaplain, the Rev. Theophilus Hamilton, to whom he had letters of introduction from home.

Now the Rev. Theophilus Hamilton was a short, stout, fair man, with a square-cut auburn beard, and of what is called Low Church tendencies, while most of the congregation were exceptionally High. But he conducted the service well and with affecting solemnity, so that he was greatly beloved by all sections alike. For he had the gift of causing in his hearers a forgetfulness of petty divisions and filling them with a spirit of deep and broad Christian feeling that was well adapted to the wants of the place.

A thoroughly good fellow was Mr. Hamilton, ever ready to assist those who asked him for aid, kind alike to working man, clerk, or rich factory proprietor, and always full of sympathy with his flock. He took the letter from Tenterton's hand, and looking at the envelope, saw the name "Green" in the left-hand corner, while at the top of the missive was written, "Favoured by Mr. Edward Tenterton."

"Oh!" exclaimed the chaplain, heartily, "this is from Green of Brasenose; and you are Mr. Tenterton. Pray walk into the dining-room there. I have been expecting you ever so long. Better late than never. Just walk into my den, will you? I'll come presently, but you see I have so many to see on Sundays. You don't mind, do you?"

"Certainly not," said Tenterton, delighted with the heartiness of his reception. "But you are so much in request to-day. May I call in the week?"

"Of course you may, but just go into the study there through the dining-room. I won't be longer than I can help."

Tenterton entered the sanctum of his new friend, and was soon lost in the happy contemplation of English books, than which nothing is more welcome to the wanderer in a foreign land. He never noticed the flight of time, and though Mr. Hamilton had been detained fully half an hour, it seemed hardly five minutes to Tenterton.

At length the cheery tones of his new friend broke in upon him with the question.

"Bookworm are you? That's all right. Nothing very particular here, though. About your matter, how is your time disposed of? Are you free in the evenings? Oh, here comes my wife. Alice, let me introduce Mr. Tenterton; friend of Green's, you know."

"Delighted to see you in Moscow, Mr. Tenterton. I am sure any friend of Mr. Green's should be welcome here, shouldn't he?"

"Of course; and now when can we have a talk?"

"Whenever you please to allow me to come."

"Will you stay and take us as we are to-day? On Sunday we have cold meat and dine early, but if you have no better engagement, stop now," said Mrs. Hamilton, very heartily.

"You see, I am staying at the Kremlin with Count Schaafstadt, and he rather expects me back after church."

"Well, then, come and dine with us on Wednesday. We shall have two friends from Petersburg who will be pleased to meet you."

"I am sorry to say that on Wednesday I cannot leave my pupils, who have specially invited me to go out with them; and, moreover, I should like to have some private conversation with you on a matter of conscience, which is very much on my mind."

"Then come and dine with me alone on Tuesday. I shall be quite alone, as Mrs. Hamilton is going out. There, Alice, there is Mrs. Muggleton again! I am afraid I must leave you, Mr. Tenterton, but we shall have a regular long chat on Tuesday. Everything is early in this country, so we dine at six. Good-bye till then."

Pleased with his reception, Tenterton went home to the Kremlin. The Schaafstadts had only just come to town. The two younger boys were at the Lyceum, and the elder had been entered as a student of the University of Moscow. He never attended lecture, but studied his subjects at home by the aid of a crack student chosen by the professor as his assistant. Besides which powerful help on the road to learning, he was in the habit of buying from the poorer students their reports of the lectures and studying them with the assistance of this young man, who was thoroughly able to instruct him and pull him through.

Thus Tenterton was losing his pupils, though he still continued to read with the younger countess, who was pleased with the knowledge Tenterton had gained of the literature he taught. It was arranged that he should remain during the winter at the Kremlin, although another person was engaged to assist the younger boys in their studies.

The count had watched Tenterton closely, and having formed a very high idea of his moral worth, wished to retain him in his family as a friend and companion for his sons. At the same time, knowing the usual effects of idleness, he wished him to be fully employed.

The police-master was a frequent guest. He had taken a strong liking to Edward, whom he often invited to his own house, where our young compatriot found a very kind friend in Madame Kakaroff, who spoke English (like most Russian ladies of distinction) perfectly. Tenterton was flattered with the attentions shown him, and especially by the interest shown in his adventures at Berozovo, to which Kakaroff constantly contrived to lead their conversation, although he must have seen that there was something which prevented Edward from being quite at his ease when speaking of the Abrazoff family.

Being now settled, for a time at least, in Moscow, Tenterton had thought it a good plan to gain money by giving lessons, and he asked Kakaroff to recommend him should he hear of any persons wanting to study English. Upon this Kakaroff wrote a letter to Mr. Smirnoff

strongly recommending him to place Ivan Dobroff quite under the guidance of Tenterton. When he proposed it to Edward he noticed that he became much agitated, and for a moment quite paralysed as it were.

"Do you feel ill, Mr. Tenterton?" he asked. "Pray let me offer you something."

"Oh, no, thank you; it will pass away in the open air. I have not become quite accustomed to your mode of life in Russia, and must get acclimatised."

"As you like; but I think you had better remain."

However, Tenterton escaped, saying that he had an engagement that evening to dine with the English chaplain, and should barely have time to go home and dress.

Kakaroff walked up and down the red drawing-room after Tenterton had left. At last he said to his wife, who was touching up a pretty sketch which she had made in the country, "Anna, the plot thickens, and the 'Dobroff mystery' is becoming still more serious. My impression is that Tenterton knows all about it, hence the evident coolness of the Abrazoffs to him, which is not otherwise to be accounted for. Paul stands by him all through, however. He is a noble fellow is Paul! Have you heard anything about him from Olga Schaafstadt or the countess?"

"Not a word; but the Princess Tcherbolinski told me that she was sure Tenterton has something on his mind, and that he ought to be made to confess. Marie Tcherbolinski says he is an English Nihilist."

"And what does Anna Kakaroff think of him?" asked her husband.

"I think he is a simple, straightforward Englishman, who, when anything happens out of the usual course, instead of shaking it off with an effort, frets about it and worries himself over it until he half kills those about him, and wears himself out body and soul."

"What has he got on his mind?"

"How can I tell? But I fancy it is something that has happened in Russia, and not in England."

"What makes you think that?"

"The singular circumstance that when he is most depressed and sad the very word 'England' brightens him up—changes him completely, and seems to start a set of ideas so at variance with the cause of his sorrow that he forgets it entirely. On the other hand, if he be in the very height of a glowing description of a 'garden party at home,' and somebody refers to Berozovo, Ozeonovo, or to the Abrazoffs, he is changed in a moment; a cloud comes over him, and it is difficult to chase it away."

"You ought to be the *chef* of the police, and I your very humble assistant. And you really have worked out this problem alone?" and Kakaroff rose from his chair, and, taking his wife's hand, pressed it to his lips.

"I am glad you approve of my little effort in your service. But now I want to know why I have seen so little of Annie lately. Is she ailing?"

"The fact of her being a prisoner has somehow dawned on her, and she seems to resent it. We have been as kind as possible in the matter, but she discovered the truth by trying to leave the house alone, which she found impossible. I have tried, but in vain, to convince her

that I have acted as her friend in the matter. She takes it very much to heart—more than I should have expected from a person of her strong sound sense."

"Have you any news regarding her trial?"

"It is to be with closed doors; no reporters present."

"I am greatly interested in her. You must save her. If anything happened to her it would almost kill little Ivan. I hope you will save her."

"Unfortunately I shall have no chance, for if I let her escape she would be retaken in a very short time. My fellows have not the scruples that the English have; they would arrest some dozen of people, and get two or three executed, before they got her, so as to be sure to be on the right side. I promise you to use all my influence in her behalf, but I must be careful for my own sake."

"Of course, you must not expose yourself to needless danger; you have already run very serious risks in bringing the matter so far."

Here the conversation was interrupted by the entrance of a third person, and the subject was dropped.

Passing through the courtyard of the palace of the police-master, Tenterton drove "home" to the Kremlin, where the operation of dressing for dinner with the chaplain was soon performed.

On arriving at the English church Tenterton asked Mr. Hamilton to allow him half an hour's private chat before dinner.

"My dear sir," replied the chaplain, "after dinner as much time as you like. Mrs. Hamilton is going to an evening party at Government House, and I told her it was the very thing, as you and I wanted a little private chat."

Dinner over, the chaplain was the first to commence.

"By-the-by, Mr. Tenterton," he said, with a kindness of manner quite peculiar to a certain class of English clergymen, "you mentioned your wish to consult me on some very important and at the same time private question; I am now quite at your service, and shall be glad to know in what manner I can be of use."

"Mr. Green will have informed you of my poor father's heavy loss and my wish to assist my mother and sisters by accepting a situation as house tutor in Russia. My first engagement was a singularly unfortunate one. Fire broke out on the very first day of my arrival, and I got hurt in the bustle that ensued. The Abrazoffs, with whom I served, were most kind and considerate to me, wishing to

pay me very highly in consequence of my accident. They engaged a medical man to attend on me, who gave up his practice at Riazan for that purpose.

The ladies of the family returned to Moscow with me, and a railway accident occurred, and now they seem vexed with me for accepting the invitation of Count Schaafstadt to go at once to the Kremlin, nor have they seemed to forget it."

"Of course they paid you your fees and all that. The Russians are very particular in their payments to tutors and governesses, although they are not always so punctual with tradespeople."

"Not only have they paid me well, but they wanted to pay me extravagantly, as I have already told you."

"Quite like the Russians also. Well?"

"I could not take more money from them than I thought I had honestly earned. Not that I am too proud to accept special pay for special service, but I cannot accept gifts from people whom I cannot esteem."

"Why, what's the matter with them? How have they forfeited your esteem?"

"That is the very business upon which I have asked you kindly to advise me. The fact of the matter is that I believe these people are wrongfully in possession of their estates; and more than that, they are wilfully and knowingly keeping the just claimant out of the enjoyment of his own."

"These are very grave charges, Mr. Tenterton. I hope and trust that they are mere suspicions!"

"That is a point of conscience on which I want to consult you. My own knowledge of Russian is very slight, but it was sufficient to lead me very early to suspect that there had been unfair play from a conversation I overheard between the intendant and Mr. Abrazoff. These suspicions have been confirmed by reading certain papers which somehow or other got mixed up with mine, I suppose at Berozovo. I read them as exercises in Russian at first here in Moscow. I was very much puzzled to account for their being in my possession, and I want your advice as to what I ought to do. I never put them into my portmanteau. In fact I did not notice them until I became, so to speak, at home at the Schaafstadts'; and, as I said, I have been spelling them out, thinking them waste paper which had somehow got mixed up with my things. My first impulse on finding out their true nature was to send them back to Mr. Abrazoff, concerning him as they do, and not me. Besides, on no construction could I have the least right to

retain them. But then came the thought that in doing this I should become a party to a most unprincipled piece of knavery. To retain them was impossible, to give them back seemed equally so. I therefore come to you with the urgent request that you will kindly advise me in the serious difficulty."

"Are the papers here? Did you bring them with you?"

"No, I wanted to see you first to ask your permission to show them to you. I can assure you I am greatly perplexed to know what course to take."

"It is very strange! I can't imagine how papers could get into your trunk without your knowing it. That you should be puzzled what to do with them is natural enough. That is the only difficult point to my mind."

"My dear sir, I hope you don't think me capable of—"

"No, no. I don't think you capable of anything dishonourable, but if we should feel ourselves called upon to act in the matter and put it into professional hands that will be a very difficult question with a Russian judge. It might be impossible to satisfy his legal mind on the subject. I am glad you came to me first. Have you said anything about it to Count Schaafstadt or to the police-master?"

"Not a word to a living soul but you."

"That's all right. Now, I must tell you what we have to do. I have a friend who is, I believe, despite the old proverb, an honest lawyer. We must consult him, and as there is no time like the present, especially for such pressing business as this, I propose that we go at once to this gentleman. He is a German, but he speaks English like one of us. We can return here later on. Or stay, I will send a man to ask whether we can be received or not; in the meantime we can chat over matters."

The chaplain sent off a servant with directions to see Adolf Brandt, who fortunately lived close by. He wrote a few lines on a card in English, requesting him to say by bearer whether he could receive him and a young friend from England that evening, and would he prefer their calling on him or would he run round and take tea with him and Mr. Tenterton?

"That's so far all right," said Mr. Hamilton. "Now we have to listen to his opinion, which is sure to be good. My impression is the matter will have to be investigated by the police, in which case your acquaintance with M. Kakaroff will be very useful to us."

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XXIII.—THE HOUR OF TRIUMPH.

THE fortunate John Watkins, now the richest farmer in Griqualand, having already given a dinner in honour of the birth of the Star of the Settlement, considered that he could not do better than give another in honour of its restoration. This time, however, precautions

were taken against a disappearance, and Dada was not one of the guests.

The dinner took place in the afternoon of the day after that on which the Star was recovered. Watkins had invited all his friends of high and low degree. He had ordered from the butcher sufficient

meat to feed a squadron of dragoons, and bought up all the wines, liquors, and provisions, preserved and otherwise, that the neighbourhood could furnish. By four o'clock the table was laid in the large room, the wine was ready on the sideboard, and the beef and mutton

were roasting at the fire. At six o'clock the guests arrived, all dressed in their very best. At seven the diapason of conversation had attained such volume that a trumpet would have had hard

its beauty, to its incomparable limpidity, to its unequalled brilliancy.

The heat was overpowering.

Isolated and meditative Miss Watkins seemed unconscious of the tumult around

"Precisely so, my worthy historian."

work to make itself heard above the uproar. There was Mathys Pretorius, who had regained his equanimity now that he had no longer to fear the persecutions of Pantalacci; there was Thomas Steel, the picture of health and strength; there was Nathan the broker, and there were the farmers, the diggers, and all the leading tradesmen of Vandergaart Kopje.

Cyprien, thanks to Alice's commands, had not been able to decline his invitation, and Alice herself was, of course, present. And both of them were very miserable, for the "more than millionaire," John Watkins, could no longer dream of giving his daughter to "a mere engineer, who did not even know how to make a diamond!"

Thus did the worthy egotist speak of the man to whom he owed his newly-found wealth.

The dinner proceeded amid the unrestrained enthusiasm of the diners.

In front of the fortunate farmer—and not behind him, as on the former occasion—the Star of the Settlement reposed on a tiny cushion of blue velvet. It was placed inside a glass globe, and the glass was inside a cage of substantial iron bars.

Ten toasts had already been drunk to

her. She looked at Cyprien, and the tears began to gather in her eyes.

Suddenly three loud knocks were heard at the door. The noise was instantly hushed.

"Come in!" shouted Watkins; "whoever you are. If you are thirsty you are just in time."

The door opened.

The long, lean figure of Jacobus Vandergaart appeared in the doorway.

The guests looked at each other in surprise. The animosity between Watkins and Vandergaart was so notorious that a murmur of expectancy ran round the table. Every one anticipated something serious.

Every sound was hushed! Every eye was turned on the old lapidary. Standing erect, with his arms crossed, with his silver locks escaping from beneath his hat, with his long black coat that he wore only on high days and holidays, he seemed the very spirit of revenge.

John Watkins was seized with a vague terror, and a secret shudder passed through him. He turned pale, notwithstanding the fiery tint with which his devotions at the alcoholic shrine had been repaid. He seemed to struggle against some unaccountable presentiment as he broke silence with—

"Well, it is a long time, neighbour Vandergaart, since you gave me the chance of seeing you in my house. What good wind has blown you here this evening?"

"The wind of justice," said the old man, coldly. "I come to tell you that right has triumphed after an eclipse of seven years! I come to tell you that the hour of atonement has struck, that I take back my own again, and that the Kopje, which has always borne my name, is now mine in law as it always has been mine in equity! John Watkins, you have been stripped of what belongs to me! To-day it is you whom the law has despoiled and condemned to give back what you took from me!"

When Watkins first caught sight of Vandergaart, and the vague fear of danger stole over him, he felt the blood run cold in his veins, but now the danger had become distinct and defined his sanguine violent temperament made him advance to meet it.

And so, lolling back in his armchair, he said, with a scornful laugh, "The good man is mad! I always thought he was cracked, and it seems that the hole has got bigger!"

The guests applauded the pleasantry. Vandergaart remained impassive.

"He laughs best who laughs last," said he, as he drew a folded paper from his pocket. "John Watkins, you know that a formal judgment, confirmed on appeal, so that the Queen herself could not put it aside, assigned to you the land in this district lying to the west of the twenty-fifth degree of east longitude, and assigned to me all that lying to the east of that meridian?"

"Precisely so, my worthy historian," exclaimed John Watkins; "and you would spend your time much better at home in bed than in coming here and interrupting a lot of fellows at their dinner who do not happen to owe a farthing to any one."

Vandergaart unfolded the paper.

"This is a certificate," continued he, in his mildest voice, "of the Lands Department, countersigned by the governor, and duly registered at Victoria the day before yesterday, to the effect that there is a serious error in all the existing maps and plans of Griqualand. The error was committed ten years ago by the surveyors who plotted the district, and who forgot to make the necessary allowance for magnetic variation in their determination of the true north. The error affects every map and plan of the district they surveyed. The rectification of that error, which has now been made, takes the twenty-fifth degree of longitude three miles farther west. That rectification reinstates me in possession of the Kopje which was adjudged to you—for, in the opinion of the lawyers and of the chief justice himself, the original judgment still stands! That, Mr. Watkins, is what I came here to tell you!"

Whether it was that the farmer had imperfectly understood, or that he simply refused to understand, he again tried to answer the lapidary with a scornful laugh. But this time the laugh sounded hollow, and received no echo from those around the table.

The witnesses of the scene sat lost in astonishment, with their eyes fixed on Vandergaart, apparently as much struck by his gravity and assurance as by the confidence he evidently felt.

Nathan was the first to break silence, and give expression to the general feeling.

"There is nothing absurd, at first sight, in what Vandergaart has said. The error might have been made in the longitude after all, and before doing anything either way, it may be as well to wait for further proofs."

"Wait for proofs!" exclaimed Watkins, slapping his fist down on the table. "I don't want any proofs! I laugh at your proofs! Is this my house or is it not? Have I not been maintained in possession of the Kopje by a definite judgment, of which even this old crocodile recognises the validity? Well, what does anything else matter to me? If I am to be molested in the peaceful possession of my own, I'll do what I did before, I'll go to the courts, and we'll soon see who'll win!"

"The courts," replied Vandergaart, with his inexorable moderation, "have done all they can. There is now only a question of fact. Does the twenty-fifth degree of longitude run where it says it does on the plans or does it not? And it has been officially decided that it does not; that there has been a mistake in the matter; and the conclusion is inevitable that the Kopje must be given back to me."

And so saying Vandergaart displayed the official certificate with all its seals and signatures.

The farmer's embarrassment became manifestly serious. He fidgeted in his chair. He tried to laugh, and the attempt failed. His eyes by chance rested on the Star of the Settlement. The sight seemed to restore the confidence that was fast forsaking him.

"And if so," he replied, "if in defiance of all right and justice the property legally given to me, and peacefully enjoyed by me for the last seven years, has to be given back, what does it matter? Have I not something to console me in that solitary gem, which I can put in my waistcoat pocket and snap my fingers at the world?"

"You are wrong again, John Watkins," answered Vandergaart, very decidedly. "The Star of the Settlement is now mine by the same title as that by which I hold the Kopje. Everything is mine—your house and all it contains. And I am prepared to take it, as you see!"

And Vandergaart clapped his bony hands, and a file of police appeared at

the open door, and a sheriff's officer stepped in, seized a chair, and took possession in all due form.

The guests had risen. The farmer remained in his chair, looking as crushed and helpless as if he had been struck by lightning.

Alice had thrown her arm round his neck, and was trying in vain to comfort him.

Vandergaart never took his eyes off him. In his glance there was more of pity than of hate, as he followed the look which the farmer gave the Star of the

Settlement, now sparkling more brilliantly than ever in the centre of the scene of disaster.

"Ruined! Ruined!"

The words were all that escaped from the farmer's quivering lips.

And then arose Cyprien.

"Mr. Watkins," he said, "now that your prosperity seems to be under a cloud, perhaps you will allow me to take advantage of the opportunity that offers. I have the honour to ask you for your daughter's hand!"

(To be continued.)

"Ruined! Ruined!"

THE HEROES OF NEW SWISHFORD:

A SCHOOL EPISODE IN FOUR CHAPTERS.

BY THE AUTHOR OF

"My First Football Match," etc., etc.

CHAPTER II.—PREPARATION.

THE week following the important consultation described in the last chapter was one of serious excitement to at least seven boys at Swishford.

Other fellows could not make out what was the matter, and as long as Bowler did not shirk the football match, and Gayford stuck up as usual for his house, they did not particularly care. It was certainly a novelty to see Braintree

diligently reading a book in his odd moments, but when it transpired that the book was "Wobinson Cwosoe" that wonder ceased. And even the surprise of seeing Crashford the lion lying down, so to speak, with Tubbs the lamb, wore away in time, and the conspirators were, on the whole, left undisturbed by Swishford to develop their plans for the eventful emigration of the coming spring.

The three last elected members of the band had fallen in promptly with the scheme, and were not a little elated at the honour conferred upon them. Crashford became quite mellow towards his old enemy Gayford, and actually paid back Bowler a half-crown which he had borrowed three terms ago. Tubbs, though less demonstrative, was equally delighted, and upset the inkpot over the chart in

his eagerness to exhibit to Wester their new home. [It was hardly worth noticing that Tubbs put his finger not on New Swishford at all, but into the centre of Peru, which he said he believed was one of the healthiest countries in all Asia.] Wester, who always made a point of agreeing with the majority, found no difficulty in rejoicing, wherever the place might be, and only wished they had not to wait so long as next spring.

"Why should we wait till then?" asked Crashford.

"Oh, it's better weather," said Gayford; "besides, Wallas is in for his Oxford local."

"Oh, that doesn't matter tremendously," said Wallas, who was beginning to think the world might after all go on if he did not pass.

"We can give him an exam. on the ship going out," said Bowler, "a Swishford local exam, you know, and offer a slice of the island if he passes."

"It strikes me," said Braintree, "a square mile of tewwitowy is warthah a wum pwize for a chap."

"But, I say," said Wester, "isn't our winter the same as their summer, so if we start now we shall just get out in the warm weather?"

"Never thought about that," said Bowler; "what do you say, Gay?"

"I know my uncle generally likes those parts not in the warm weather," said Gayford. "But then he's been at sea all his life."

"By the way, when does his ship start?" inquired Wallas; "something depends on that, doesn't it?"

"So it does," said Gayford. "I forgot that. He got home a fortnight ago, and he gets six weeks at home. That'll bring it to the end of November."

"Just the very ticket—we must start then, I say."

"But how about my wife if we don't go home at Cwistmas?" asked Braintree.

"Oh, bother! Couldn't you get it sent up somehow, or couldn't you fetch it next Monday?—that's the term holiday, you know."

"Hold hard," said Bowler, "I've got another plan for Monday. You know we ought to get our hands in a bit before we start, and try and find out what we really want and all that sort of thing. Now my idea is for us to get the coast-guard's boat for the day at Sound Bay (you know there's never any one there to look after it), and sail across to Long Stork Island and knock about there for the day just to see how we get on. Of course we shall have to come back before six; but we must make believe we've landed there for good, and see how we manage. And, of course, if we get on there we're bound to get on at New Swishford, for it's a far jollier place than the Long Stork."

Bowler's proposition was hailed with acclamation. His hearers were just in the humour to put their enthusiasm to the test, and the notion of a picnic on the Long Stork as a sort of full-dress rehearsal of the capture of New Swishford suited them exactly.

They proceeded immediately to discuss ways and means, and found that by putting their pocket-moneys together they could raise the very respectable sum of forty-one shillings. Reserving the odd shilling for the possible contingency of having to "square" a coastguard for the use of the boat, they had two pounds to

devote to the purchase of stores, weapons, and other necessities; and, as Gayford pointed out, of course anything they got that wasn't eatable would come in for New Swishford.

A sub-committee, consisting of Bowler, Braintree, and Wester, was appointed to expend the funds of the adventurers to the best advantage, and meanwhile each member was asked to report what else he could contribute in the way of stores to the general need. Before the end of the week the list was handed in, and as the documents might some day be of immense value to the future historian of New Swishford, I quote them here.

Bowler.—A waterproof, a hat-box, a pair of cricket-balls, and a fold-up chair.

Gayford.—The chart, a compass, jam-pots for baling out boats, an eight-blade knife, a hammer and tacks, and a chess-board.

Braintree.—The wife (pwaps), "Wobinson Cwosoe," gloves, and umbwellah.

Tubbs.—A crib to Sallust (sorry that's all I've got).

Crashford.—Clay pipe, pack of cards, a corkscrew, a strap, and "Hal Hiccup the Boy Demon."

Wester.—Three tumblers, bottle of ginger-beer, and a bat.

Wallas.—A saucepan and two eggs, a rope, and "Young's Night Thoughts."

At the same time the sub-committee reported the purchase of the following stores:—

	s.	d.
Fourteen tins of potted shrimps	14	0
Ditto ditto peaches	14	0
Ditto bottles of lemonade	3	6
(1d. each allowed on returned bottles.)		
Four of Stodge's spice-cakes	4	0
A fishing-rod	2	6
Flies for ditto	1	0
One kettle	0	6
One crumb-brush	0	6
Total	£2	0 0

This admirable selection of stores met with universal approval. Indeed, as regards the first four items, every one so highly approved that they wanted to take every man his share for safe custody to his own study. It was, however, thought undesirable to put them to this trouble, and the sub-committee were directed to continue in charge of these and the other voluntary contributions until the eventful day.

That was not long in coming round, though to the anxious voyagers it seemed long enough. The interval was spent in deep deliberation and solemn preparation. Braintree had his boots most carefully blacked, and Crashford practised boxing all Saturday afternoon with Rubble of the fifth; Bowler and Gayford strolled casually round to Sound Bay to see that the boat was safe in its usual place, and prospected the distant dim outline of the Long Stork from the cliffs. Tubbs, feeling he must do something to contribute to the success of the undertaking, wrote a long letter home, which he forgot to post, asking the forgiveness of his second sister, and adding, "Address for Monday, Long Stork Island." Wallas amused himself by reading over the directions for restoring life to the apparently drowned, and Wester tidied up Bowler's study and helped him make up the stores into seven equal brown-paper packages, writing the name of the owner of each on the outside.

This done, the preparations were pronounced as complete as they could be till Monday dawned.

The town holiday was an absolutely free day for the Swishford boys. There was no call-over in the morning, and, indeed, until the evening until eight o'clock they were their own masters.

Most of the boys availed themselves of their liberty by lying in bed an hour later than usual on the November morning, a practice which greatly favoured our heroes in their design of escaping a little before dawn.

Bowler was the first up, and went round to wake the rest.

"Howwid gwind," said Braintree, sitting up for a moment in bed and rubbing his eyes, and then subsiding again under the clothes. "Needn't get up yet, Bowler, it's long before cockwov."

"It's just on six o'clock, I tell you, and it'll spoil it all if we don't get away by a quarter past. Do get up, there's a good fellow."

"Howwid waw morning," groaned Braintree. "I'd warthah—oh, vewy well, I'll get up."

And with a great effort he struggled out of bed and began to array himself. Bowler had a similar task with each of the other adventurers, and any leader less sanguine or eager might have felt his arduous damped by the evident want of alacrity on the part of his confederates to respond to the call to action.

However, once up, the spirits of the party rose, and they assembled in good-humour in Bowler's study, where by the dim light of a candle the seven brown-paper parcels were solemnly doled out and a final review of the preparations made.

A few more articles, such as a whistle, a bottle of hair-oil (contributed by Braintree), a shut-up ink-pot and pen from Wester, and a guide to the environs of Tunbridge Wells from Tubbs, were thrown into the common lot at the last moment, and stuffed into the pockets of the ulsters in which the boys had armed themselves against a rainy day.

All this being done, Bowler gave the order to march, which the party obeyed by taking off their boots and crawling downstairs on tiptoe to the front door. As silently as possible the great lock was turned and the bolts drawn, and next moment the adventurers, with their boots in one hand and their brown-paper parcels in the other, stood under the stars.

"Now stick your boots on sharp and step out," said Bowler.

The order was promptly obeyed, and the dim gables of Swishford soon vanished behind them as they sped along the cliffs towards Sound Bay.

It was a good three miles, and in their ulsters, and weighted with their brown-paper parcels, the boys made slow progress.

It was already dawn when, rather fagged and not quite sure how they were enjoying it, they reached the top of the path which led down to Sound Bay. The near approach to their journey's end revived them, and they stumbled down the stony path cheerily but cautiously, until at last they had the satisfaction of seeing the boat bobbing up and down in the little natural harbour close among the rocks.

The wily Bowler and Gayford had marked where the oars and sail were kept, and fetched them in triumph from

their hiding-place. The seven brown-paper parcels were solemnly embarked and stowed away under the seats, and then one by one the heroes of New

Swishford stepped on board, the painter was thrown loose, silent adieux were waved to the land of their birth, and their gallant boat, nimbly propelled by Gay-

ford and the boat-hook, threaded its way through the rocks and made for the boundless ocean.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

By PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXXIX.

SOADY returned to his sitting-room, where Lang was anxiously awaiting him. He first of all told how he had dismissed the intruder, and then gave his message.

Lang looked dismayed.

"You told me you didn't owe him any money," said Soady.

"I don't," faltered Lang. "I've paid him every penny."

"Well, it's no business of mine," remarked the other, "except in so far as I can be of any service to you."

"You are very kind," said Lang, doubtful whether he should give him his confidence or not. Fanshawe's threat had all the additional force of vagueness. It could not be told exactly what he meant to do.

Lang was still cogitating when Garland unexpectedly arrived, earlier than he anticipated. Soady at once informed him of Fanshawe's visit, at which Garland looked grave.

"I was afraid of it," he said; "I thought he was only waiting."

"Look here," put in Soady; "it's clear you two fellows want a quiet talk together; there's something on hand which I don't know anything about. I'll just run out for half an hour, and when I come back we'll try and make things a little livelier. This was to be a kick-up in honour of Lang's signing in, you know."

"No, stay," said Garland. "I think Lang won't mind your knowing about it, and you may be able to help us."

"Tell him, by all means," assented Lang.

Garland gave a short *résumé* of recent events, laying quite as much stress on the energy which Lang had shown recently in returning to straight paths as on his former deviation from them.

"It's a bad business," assented Soady at the end, "but not so bad as it looks. It seems to me the affair cuts both ways. If Fanshawe lets people know that Lang never passed the matric. at Christmas we could let his firm know that he personated another man."

"Yes," said Garland; "we have a stronger case than he imagines now that Lang has honestly passed."

"Of course," cried Soady. "The whole thing really turns against him. Lang has passed and so has a right to sign his articles; what he did was to absent himself from the previous exam."

"Yes," said Lang; "but all the same, if the affair becomes known it will ruin my character for ever."

"But it will be against Fanshawe's advantage to let it become known," said Garland, "and no one else is likely to mention it."

They discussed the matter pro and con for some time longer. It was finally arranged that Lang should write that night to Fanshawe, asking him to call at Mr. King's at five next day. But it was not Lang who was to interview him; that undertaking was reserved for Garland.

Garland lay awake an hour or two that night trying to settle his line of attack or defence. It seemed to him that he had much the stronger side, and that Fanshawe could do nothing but submit.

Nevertheless it was not without a more than usually rapid pulse that he entered the little room into which Fanshawe was shown. A great deal depended on the result of this interview.

"Hullo!" exclaimed Fanshawe, as Garland entered. "I want to see Lang, not you."

"Lang has deputed me to see you."

"But I prefer Lang, though his friends seem ready enough to take his place. You'd better tell him I want to see him, and that I've come for the money; he'll know what."

"You must listen to me first," said Garland.

"Not a bit of it; I've no time to waste over half-fledged parsons. Look here; you see this letter? You may tell Lang that if he doesn't bring me the ten pounds before I leave this house I shall post this as I go home."

"You had better not," said Garland, quietly.

"What do you mean?"

"I mean you would be merely exposing your own wrong-doing. He owes you no money and will pay you none."

"Well, he knows what the result will be."

"You seem to be unaware of the whole story," said Garland. "From what I know of it, it seems that Lang passed the matriculation and is now articulated; but I don't see what hold you have over him."

"Don't you? Supposing that he never passed the matric. at all?" sneered Fanshawe.

"On the other hand, suppose that he did?" inquired Garland. "Look at that."

He handed him a paper, containing a list of the successful candidates at the June exam.

"Where is your case?" asked Garland. "You see Lang appears to be all right."

"There's some swindle here," exclaimed Fanshawe, who was taken completely by surprise.

"Yes, there is," assented Garland, "but it is on your side. Do you still wish me

to give your message to Lang, or shall I wish you good evening?"

Fanshawe sat still, twisting his hat in his hand. He looked puzzled. At last he rose and said, "You'd better give my message just the same."

"I will if you like," said Garland, carelessly, though he was inwardly quaking.

"The fact of his passing in June makes no difference to the fact of his not passing at Christmas," said Fanshawe. "He's just as badly off as ever."

"Is he? Really I don't quite see it. He intended going up at December but was prevented—an unscrupulous fellow had the effrontery to personate him. It seems to me the man who personated him is the one who is in a hole, not the man who was personated."

"That's very clever," remarked Fanshawe, "very clever indeed. Do you think you've got me? Not quite!"

"It must be for you to decide that."

"All right, I'll decide now. Lang won't give me that money?"

"Not a farthing."

"Very well; I shan't post this letter, but one which will be in the same terms without going so much into details. Or wait a moment!"

He sat down again and began thinking it over. His idea was that it would be better not to write at all, for even if he omitted his signature inquiry would ultimately lead to his getting into trouble as well as Lang. A better plan would be to see Mr. Clarke (of the firm under which Lang was placed), and, under a pledge of confidence, tell his tale about Lang.

Yes, that would screen him to perfection.

He again took his hat. "It's your last chance, Garland," he said. "I've got him firm. Yes or no?"

"No," replied Garland.

"Good-bye, then."

"Good-bye," said Garland, calmly. "However, I may as well tell you that the same day that anything is said about Lang to his firm, the firm to which you belong will know the whole story."

Fanshawe slammed the door and turned round in a rage. His plan had been foreseen and forestalled.

"What!" he cried, livid with rage. "What do you want to interfere for? I'll smash you if you come between me and Lang."

He lifted his stick threateningly. Garland did not flinch.

"Soady's in the next room," was all he said.

Fanshawe dropped his arm, but was quivering with passion.

"It isn't over yet," he said, pushing his face near to Garland's. "I'll get my revenge if I can't get my money. I've got to hold my tongue about the exam, that seems settled. You've been clever enough to see that it cuts both ways, but there's one thing you won't get over—Lang is a thief! He left school because he had stolen the football money. How are you going to disprove that? Will he pay up my ten pounds now? or shall I write to Mr. Clarke and tell him he has a new pupil who is suspected of robbing?"

"You dare not do such a dastardly act," cried Garland.

"I vow I will. I'll pay the lot of you out. I don't care if I get into trouble myself as long as I can pay off my scores. Now, what do you say?"

It was Garland's turn to hesitate. This put an entirely new complexion on the affair. It looked as if Fanshawe was about to win after all. He evidently thought so, for he had an evil, exultant smile on his face.

"Come, hurry up," he said. "I've no time to waste with you."

"I don't know quite what to say," said Garland. "I hadn't calculated on your being such a scoundrel."

"Come, I'm not going to stand talk of that kind."

"I hadn't intended to indulge in it. You seem to be in want of money," he added.

"That's no business of yours," retorted Fanshawe.

"I must consult Lang before I can give you a final answer. If I give you a sovereign now will you promise to do nothing till you see me again?"

"That depends on how long you keep me waiting."

"You shall know to-morrow evening."

"Very well, I'll wait till then, but no longer. It only means that I shall have your pound as well as Lang's ten."

Garland made no reply. The interview was over as far as he was concerned, so he rose and walked out of the room, leaving the sovereign on the table. Fanshawe picked it up and found his way

out of the house, feeling disgusted at being treated with such contempt and yet buoyant with the sense of victory.

Lang and Soady were eagerly awaiting Garland's report. But Garland did not make one. He contented himself with saying that there was a hitch which he hoped to get over, and that in the meantime Lang must trust in him. Lang was somewhat disappointed, but could only acquiesce, knowing that Garland would be sure to act wisely.

The explanation of his reticence was his promise to Melhuish. His one hope now was to be able to confute Fanshawe's charge of theft against Lang by producing the actual thief. But supposing that Melhuish refused to come forward, there would be no use in telling Lang of his

"He lifted his stick threateningly."

existence, and his promise to conceal his whereabouts would be broken.

So Garland resolved to see Melhuish first, and acting on the principle of striking whilst the iron is hot, he took his hat and set off to find him.

(To be continued.)

A SCHOOLBOY'S ADVENTURE WITH MOONLIGHTERS.

BY JAMES COX, R.N.,

Author of "Fascinated by a Fakir," "How I Saved
My Aunt's Diamonds," etc.

CHAPTER V.

WE must now turn our attention to Reginald Brown. After Charley left him alone in his room, he put out the light, and opening the shutter very carefully, he gently raised the window and looked cautiously out. The ground beneath was white with the fallen snow, but overhead the sky was black as pitch. After listening for a few seconds he took the sheets out of his bed, knotted them together, and securely fastening one end to the window ledge, he crept out and lowered himself to the earth. Then he paused for a moment, and crawled on his hands and knees towards the shrubbery, and in the direction of the stables. Once his heart beat rapidly as he heard some one call out only a few yards ahead of him, "This way, Nagle." Then there was a cracking of branches of trees as if two or more persons were forcing their way through the shrubbery in the direction of the house.

Reggy reached the stable without further alarm, and, letting himself in, locked the door and hurriedly yet silently proceeded to put the saddle and bridle on. This operation was no easy task in the

dark, but at last the boy accomplished the business and realised at once that his difficulties were about to commence.

"I shall have a hard job to get Nero out of the grounds," he said to himself, "without being discovered."

He unlocked the door and listened attentively. All was quiet save the voices of the mob surrounding the house; so leading the horse quickly round to the back of the stable he mounted and rode through the kitchen garden until further progress was stopped by a low stone wall which divided the garden from the fields beyond.

The next moment horse and rider were over this wall, and then Reggy trotted quickly towards the plantation, and striking into a bridle-path that he had often ridden along with Charley he soon emerged into the highway.

As he jumped Nero over the embankment that separated the plantation from the road he fancied that he saw the form of a man crouched beneath in the ditch. However, he did not stop to examine closer, but giving the reins to the horse he struck the animal smartly across the flanks and galloped towards the town as fast as he could.

For the first mile the road was tolerably level, and although the plantation and dark line of firs on each side shut out the little light that there was, Reggy had no difficulty in tracing the road, thanks to the snow upon the ground.

As he drew near the base of the mountain, where the road gradually wound upwards and along its side, he slackened his speed for a few minutes to breathe the horse before breasting the ascent. Just then there was a shout from the ditch on his left, replied to by another from the right, followed instantly by a blinding stream of fire, and the report of one or more guns.

Immediately two men rushed into the middle of the road, and attempted to seize the horse's head, but the animal, terrified by the noise, reared, and suddenly bounded forward, bearing one of the fellows to the earth. The other made a grab at Reggy's leg as the horse dashed by, but missed it.

"Take that, colonel!" yelled the disappointed ruffian, and drawing a revolver from his pocket, he discharged it at the flying horseman.

Reggy felt a stinging sensation in his left arm, and it dropped helplessly by his side, but he set his teeth hard and urged Nero to his topmost speed. He felt that everything depended on his reaching the police hut, but a sickening feeling crept over him, caused by the wound, which began to give him great pain. Every stride of the horse increased the agony, and as he gained the brow of the hill and saw far away in the distance the twinkling light of the town, he began to fear that he would scarcely reach the hut. The feeling of faintness gradually stole over him, and once he almost reeled from the saddle.

"What will become of Eileen and the others," he thought, "if I break down? I mustn't give in."

Presently the white road before him appeared to be rising and falling like the waves of a stormy sea, and the boy commenced to reel and then sway forward on the saddle. With a great effort he managed to keep his seat for a few seconds longer, as a turn of the road brought him in sight of the police hut,

but his strength was fast failing, and he could only just pull up Nero and call to the sergeant of constabulary, who was fortunately standing at the door of the hut, to hold the horse, when he fell fainting to the ground.

When Reggy came to himself he was lying on the floor of the police hut, surrounded by some five or six of the constabulary, and the sergeant was endeavouring to pour something down his throat.

Directly the boy could speak he implored the sergeant to send assistance to his friends at Castle Kilrea without delay.

"All right, sir. Here, O'Brien, bind up the young gentleman's arm, and you, Gallagher, and the other, off with you at once. No time to lose."

"Hullo! what's the matter here?" said a voice at the door.

The sergeant sprang to his feet as he recognised his sub-inspector, and, touching his cap to his officer, said,

"Tis the young gentleman from Castle Kilrea, your honour. The scoundrels have hit him by mistake for the colonel. There's a lot of 'em attacking the colonel's house."

"Colonel Fitzgerald!" exclaimed the inspector. "Why, I passed him five minutes ago on a car. He'll be here in a moment," and the inspector sprang off his horse, and, advancing towards Reggy, said, "Are you badly hurt?"

"I feel better now," said the boy, staggering to his feet. "The loss of blood made me faint."

The inspector turned to the sergeant. "Look out and see if the car is coming."

"Here it is, sir," and as he spoke Colonel Fitzgerald's voice was heard.

"Anything the matter?" asked that gentleman, as he pulled up, on recognising Nero and the inspector's horse.

"Yes, colonel," replied the sergeant; "here's a young friend of yours, who has received a present that was intended for your honour."

"Reggy!" exclaimed Colonel Fitzgerald, "I hope you are not injured."

"It might have been worse," said the inspector. "The arm is not broken, but you had better take him up on the car with you at once; he'll tell you all about it. Sergeant, you get on the colonel's horse and follow me. I don't want to alarm you, Colonel Fitzgerald, but if we don't reach your place in double-quick time it's impossible to say what will happen there!"

Reggy hurriedly explained to the colonel what had already happened, and as the inspector and the sergeant galloped off after their men, the driver lashed his horse and followed close on their heels.

Colonel Fitzgerald was now thoroughly alarmed, and put question after question to his young friend as they tore along, and the more information he elicited from Reggy the more anxious he became.

Presently they overtook two of the constabulary, who were running along.

"Jump up here, men! Quick!" said the colonel. "And now, Pat, I'll give you five pounds if you cover the remainder of the journey in half an hour."

"D'ye hear that, ye baste!" yelled the car-driver as he tickled his mare with his whip. "Hould on, yer honour! Arrah! what's that beyond there?"

A lurid glare broke on their view as

the car swept round a corner of the mountain.

"The villains have set fire to the castle!" groaned the colonel, and he shuddered as he thought of the fate that might have already befallen his daughter and boy.

CHAPTER VI.

WE left Charley and the two servants, Dan and Mick, in the room over the hall door, while Miss O'Dowd was prancing about her bedroom armed with the poker and shovel, bemoaning her fate at having ever quitted her native town.

When the bullet from the gun of one of the Moonlighters struck the window and shattered in its flight a large mirror, the noise caused by the crash of falling glass nearly drove the poor lady out of her senses.

She tore out of the room and down the corridor, flourishing her weapons, crying, "Charley, save me! save me!" and rushed into her nephew's arms just as he was about to carry his threat of firing at his assailants into execution.

"Stand back, aunt, for a moment!" said Charley. "You had better keep at the other end of the house unless you want to be hurt! Look out!"

Crash another bullet flew through the window, and buried itself in the wall within a few feet of the spot where Miss O'Dowd was standing.

Charley's aunt gave a wild screech and bolted back to her room.

"Now, Mick," exclaimed Charley, "we must fire, or else they'll have the door down!" and, stepping to the window, the boy fired, and Mick followed up with another shot.

The effect was marvellous on the Moonlighters! Giving vent to a volley of groans and shouts, they scurried like frightened hares across the snow to the cover of the shrubbery.

After this there was a long silence. The fellows were evidently consulting together.

"Look here, Mick," presently said Charley, "I want you to go up on the roof, crawl round the leads, and try to see whether the fellows are attempting to get in at any other part of the castle. If you hear or see any movement, fire, and I'll come to you."

Mick departed on his errand, making his way along the corridor, at the end of which there was a trap-door giving admittance to the roof. As he stole quietly past Miss O'Dowd's bedroom he heard the voice of Eileen trying to comfort her aunt.

Quickly mounting the steps that led to the trap hatch, he got out on the leads and crawled slowly round the roof, listening attentively, but there was not a sound to be heard except the sighing of the night wind.

Satisfied that all was right, he was about to descend through the aperture, and had just placed his feet on the top step of the ladder, when the ladder slipped from beneath him, and with great difficulty he saved himself from falling into the corridor.

By extending his arms he prevented this catastrophe, and was just going to lower himself when he felt his legs seized from below, while his ears were assailed by piercing screams.

"Oh, you villain! quick, Dan; run, Eileen, bring me a carving-knife while I

cut his legs off. They're coming through the roof!"

"Hould on, ma'am," shouted Mick, "sure it's only me," and, letting go his hold, he dropped suddenly, and falling violently on Mrs. O'Dowd, sent her sprawling on the floor.

"Murder, murder!" shrieked the old lady, and then scrambling to her feet she turned and fled from the scene amidst the shouts of laughter that greeted Mick's advent from Charley, Eileen, and Dan, who had been attracted to the spot by the cries of Miss O'Dowd.

But on returning to the room their merriment was quickly turned into sorrow. A fierce red glare lit up the whole of the apartment. Charley's first impression was that the castle was on fire, but Mick, pointing in the direction of the fields, exclaimed,

"There, your honour, the rogues have set fire to the hay in the hay-yard; bad luck to 'em!"

Sure enough they had. The flames roared and mounted higher and higher, illuminating the castle and the surrounding country.

"This'll bring the police down on 'em," angrily muttered Dan.

"I hope so," ejaculated Charley; "but I fear they'll have time to do more mischief before help comes."

Charley's fears were not without ground, for now a waggon piled with hay and drawn by one of the colonel's horses was observed coming in the direction of the castle. A man was seen urging the animal onward, and close behind the waggon marched a number of men with blackened faces. As the waggon drew near the house the sharp-sighted Mick whispered to his young master,

"Look, yer honour, one of the blackguards has got a bit of a torch. Sure, I'll give him the last taste in the world of the blunderbuss; pass it here, Dan, me boy."

The waggon was now close to the hall door, and the Moonlighters, protected to a certain extent by the cover it afforded, jeered at the occupants of the room above.

"We'll burn ye like rats," shouted out the man with the torch, waving it derisively over his head and stepping slightly to the front to let the "rats" see.

"Bang!" went the blunderbuss, and away went the torch some yards through the air, while the Moonlighter, rolled over in the snow. At the same moment the horse, startled by the loud report, made off down the avenue.

"I think the rascals have had enough," exclaimed Charley, looking out of the window; "they are running off."

"An' moighty good rason they have sure!" shouted Mick; "look at the peelers! they're on to 'em! There's the colonel. Hoorah!" roared Mick, waving the blunderbuss round his head.

"Run down, Dan, and open the door: there's something the matter with Reggy. Father's lifting him out of the car. Quick, man, quick!"

"Oh, I hope not," said Eileen, who, just then coming out of the room, overheard Charley's remark, and then hastily followed her brother downstairs to the hall.

They got to the foot of the stairs just as the inanimate form of Reggy was being carried by Dan and the colonel into the dining-room.

Eileen shuddered, and the tears gathered in her bright eyes as she looked on the

boy's pallid face, and she screamed as she saw that the sleeve of his left arm was blood-stained.

"Oh, papa!" she exclaimed, in a broken voice, "is he dead?"

"No, darling, but he's wounded, and the jolting of the car has been too much for him. He'll come to directly. Give him more air, Charley. Open the window, and tell Mick to take the car and fetch the doctor;" and the colonel hurried off to assist the constabulary in securing their prisoners.

About five had been captured, and these the police had already bound and were ready to escort to Galway.

"I'm going to march them off at once, colonel," said the inspector, "and if you'll ride over to the court the day after tomorrow we'll settle their business for them. I'm sorry we haven't got the whole lot. There's one fellow badly hurt, and with your permission we'll leave him here until the doctor arrives to see your plucky young friend."

Colonel Fitzgerald thanked the inspector for his promptitude in coming to the rescue of his family, and, turning the wounded Moonlighter over to the care of Dan, who had him conveyed into the house, went in to see after Reggy, who, under Eileen's treatment, had been restored to consciousness, and was sitting up listening to Charley's account of the attack on the castle.

"We have to thank you, old boy, though. If it hadn't been for you I doubt whether we should have been able to have prevented them from burning the place down."

"Yes," said the colonel, "if Reggy had given in after the nasty hit he received we should have been too late. There's no doubt, Reggy, that in the darkness the wretches mistook you for me. But here comes the doctor."

"Good evening, colonel," remarked a little stout gentleman, bustling into the room. "What's all this I hear? Nice state we are getting into, when a gentleman can't take an evening ride without being potted at. Come, my boy, let me have a look at this arm of yours. Just try and lift that limb, my lad," said the doctor, in a kindly tone. "So; there, that'll do; I see there are no bones broken. Now, Master Charley, hand me that case."

Dr. Donovan extracted from the case a long bright pair of scissors and commenced cutting off the sleeve of Reggy's jacket. As soon as this operation was completed he knelt down and examined carefully the boy's wounded arm. The inspection was evidently satisfactory. "All right, young gentleman, I'm glad to tell you that I shan't have to torture you; the bullet has gone clean through, and fortunately just above the elbow. If it had struck a little lower down—well, never mind; a miss is as good as a mile."

"Now, colonel," said the doctor, as he finished bandaging Reggy's arm, "I'll hand the young fellow over to the care of Miss Eileen, and if she doesn't cure him by this day week I shall be much mistaken. Good night. I must just pay a visit to the man Mick shot and then be off."

As the doctor departed Colonel Fitzgerald inquired for Miss O'Dowd.

"Shure, yer honour," said Dan, "she's packing up her portmanteau."

"It's packed, Fitzgerald," said that

lady, entering the room, "and at daylight to-morrow I leave for Dublin."

But next morning Miss O'Dowd changed her mind, and nothing could

exceed the kindness with which she nursed and attended to Master Reginald, who under the combined care of Eileen and her aunt was enabled long before the

expiration of his holidays to again ride Nero across country and shoot wild duck on the lough.

(THE END.)

WALKING-STICKS, AND HOW TO TREAT THEM.

WALKING-STICKS of all varieties—apple, ash, blackthorn, brier, cherry, elm, hazel, holly, oak, vine, and whitethorn—are best when cut in the winter, between November and February; the sap is then sluggish, the leaves are off, and the character of the stick can be most easily described.

To boys who desire to carry a stick of their own choice and dressing the following practical notes will be of value.

Never attempt to trim a stick as soon as you have cut it. Leave the branches on it an inch or two long, and hang the stick up to dry for a week or so knob end uppermost with a weight on the narrow end. Let it hang in a moderately cool place, and when it is dry and pliable take it down and begin to trim it. Cut off the branches you do not want, and make the crook if you do not care to finish merely with a knob. To make the crook, plunge the end for a quarter of an hour in boiling water, bend it to shape, and keep it in place by a piece of string twisted by a stick in the middle like the spring of a jumping frog or the stretcher of a ribbon saw. When the stick has dried in shape, trim it to taste with a sharp knife, and give it a good rub down with sand-paper. When it is smooth and presentable, if you want it to remain its natural colour, give it a coat of boiled linseed-oil and let this dry thoroughly into it. If you want the stick to be black, boil a pound of logwood chips for an hour in a quart of water and brush the stick over with the boiling liquor. When the stick is dry give it another boiling coat of the decoction. When that is dry, dissolve an ounce of green copperas in a quart of hot water and

coat the stick with the solution. Keep away from the fire with the stick and let it dry each time slowly and well, and you will find that the mixture of the copperas and the logwood has dyed it an intense black. After you have stained it, give it a coat of boiled oil, and when that is thoroughly dry begin to polish it.

For the polish mix an ounce and a half of shellac with a quarter of an ounce of gum mastic and dissolve them slowly in half a pint of methylated spirits, or, what is better, quicker, and cheaper, buy threepennyworth of French polish from the nearest oil-shop. Having polished the stick, finish it with a coat of hard varnish or copal varnish such as the artists use, of which a little goes a long way. Hard varnish can be bought cheaply. If you must make it, mix together an ounce of gum mastic, two ounces of gum juniper, a quarter of an ounce of turpentine, and a pint of methylated spirits. Give the stick one or two even coats of varnish, and you will find it last for many months. Some sticks do very well varnished over the oil and stain, then the polish is saved. If you want to stain a stick brown add dragon's blood to the polish; if you like it golden coloured drop in some yellow ochre or gamboge. The difficulty in stick-making, however, is not in the polishing; it is in the bending and trimming.

Apple makes excellent sticks if judiciously dried. Ash sticks are best cut from saplings; when cut from hedges or pollards they are inclined to become brittle. Like apple sticks, they require careful seasoning to be serviceable. Blackthorn sticks are heavy

and liable to splinter. They are best when cut from saplings. Brier sticks are also best when cut from saplings. Cherry sticks should be stripped of only a part of their bark, and require sand-papering, oiling, polishing, and varnishing. Elm sticks should have the rough bark left on; they also are best when taken from saplings, but it is very seldom indeed that an elm stick is fit for anything else than to be looked at. Hazel sticks are light and handsome, and do good service no matter whence they are cut. They should be well rubbed down with sand-paper and carefully varnished. Holly sticks are as good as any. Cut them from the branch with the crook or knob attached, and let them have a long time to dry. Oak sticks are the strongest and toughest, but the most difficult to dry and trim. If you dry them too rapidly they split, if you dry them with the bark off they split, if you have the knots close together they split. If you get a good oak cudgel you can smash any stick of any other wood not exceeding it in size. Vine sticks are also of value, but they have an unpleasant tendency to warp and twist. Whitethorn sticks are like unto blackthorn sticks—heavy, treacherous, and brittle.

If you want to bark a stick steep it in hot water and rub off the coat with a piece of sacking. If you want to bend or straighten a stick, cover it with hot wet sand and get it into shape while it is hot.

Of canes we need make no mention, nor need we deal with the birch. They are but luxuries, frequently doomed to be misunderstood. Their days are over. Alas, poor cane! Alas, poor birch!

THE NEW RIVER.

WHAT a charm there is in water! Even the unromantic New River lightens up the landscape of northern London and yields many a rural scene worth noting, as our artist's sketches testify. Take the first, where we see the river in its infancy at Chadwell Springs, near Ware. How quiet and still and yet instinct with life the water is! In the New Gauge at King's Mead, near Hertford, and the little footbridge at Amwell Pond, the same charm is noticeable. Even the Pumping Station at Cheshunt affords a decent picture when the water is made much of in the foreground. The sketches of the bend in Theobald's Park, of the pretty nook at Enfield Sluice House, and of Green Lanes Pumping Station, with the swans afloat, owe nearly all their charm, as they owe their existence, to the stream. Taken by itself, what an ugly thing a pumping station is, internally or externally! Look at the inside at Green Lanes, and the outside at Hornsey. Hornsey seems all chimney, and the little grace it possesses is entirely due to the water, plain and straight though its banks may be. Even the picturesque old Sluice House close by, where the lads are shown engaged in the highly unsatisfactory amusement of "fishing in the New River," would be a commonplace cottage without the lights and shades in the ripples.

Fishing in the New River! What a lesson for great expectations! In the reservoirs there is excellent sport, and permission to try them can be obtained from the chief

officers of the company; but in the stream itself—where it can be got at—it would require one of Cleopatra's divers to bring a decent fish to the hook. And fishing in reservoirs is not always free from risk. A friend of ours tells how, having obtained permission to fish in a certain reservoir, he arrived early a few weeks afterwards and set to work. Not a nibble did he get. At last, as he was packing up to depart, a man came by and inquired what he had been doing.

"Nothing!" said he.

"Caught naething?"

"No! I don't believe there is anything here to catch!"

"Noa! No more there be. There waur; but they been a-cleaning this place oot and only let in the watter last Toosday!"

And that may have been when the water was let into the distributing reservoirs at Clerkenwell, which form the subject of our last sketch. What a wonderful work in an engineering sense this New River was for the days in which Hugh Myddelton designed it! It is a well-worn story, but it always bears re-telling.

The London of 1600 was not a quarter the size it is now. The limits of "the City" pretty nearly describe the metropolis of Sir Hugh Myddelton's days, and the districts which have since become part and parcel of it were then quiet rural villages, between which and London itself green fields and meadows existed, and to which shady country lanes and paths led. Such, for instance,

were the villages of Clerkenwell, Islington, Highbury, Hackney, Homerton, Bow, and Stratford. Indeed so uninhabited and lonely was the country lying between the first two and London, that at much later date we read that when the citizens wished to visit those villages in the evening, they used to band together in companies for the sake of mutual protection against footpads and robbers. London of that day was not a large place. It fringed the banks of the Thames on both sides, from Westminster and Lambeth to the Tower of London and Horselydown; spreading out to the northward from Temple Bar as far as Holborn, and then branching off in a north-easterly direction to Aldersgate. Thence continuing towards the east as far as Bishopsgate, whence it ran down south-eastward to Aldgate and the Tower.

To those dwelling on the banks of the river, the Thames would provide an unfailing supply of water, and water of a tolerably pure quality. There were no public analysts then, and as the generality of people dwelling in the town were not overburdened with learning, and not too fastidious, we may presume that this water was used by those in its neighbourhood for all domestic and even drinking purposes. Those citizens living in the neighbourhood of what is now Farringdon Street would have the Fleet river, which, rising in Caen Wood, between Hampstead and Highgate, flowed through Battle Bridge, now King's Cross, past the foot of Ludgate Hill, and so into the Thames. The remainder

New River Source, Chadwell Springs, Ware.

of the citizens had to rely for their water upon such as they could catch during rain, the surface wells, and the several conduits, or public reservoirs, supplied by leaden pipes from outlying districts, for which useful works they were indebted to the munificence of mayors, sheriffs, and other individuals. There were nearly twenty of these conduits in London, without counting the outlying districts. One of the chief ones was the great conduit at the east end of Cheapside, at its junction with the Poultry, and, says Stow, the famous chronicler of London, "was the first sweet water that was conveyed by pipes of lead underground to this place in the citie, from Paddington," then a little village four miles from London. This was in the year 1236. As the population increased the need of more water increased with it, and in one year alone nine fresh conduits were erected, supplied with water from various outlying villages. Yet with all these the water supply

Foot Bridge, Amwell Pond, Herts.

could not keep pace with the population, and about the close of the sixteenth century the question of what was to be done became of vital importance. During the reigns of Elizabeth and James many plans were suggested, among them being two, the first for bringing a river from any part of Middlesex or Hertfordshire to the north side of London, and the second for bringing a river from Uxbridge to the same locality, but neither of these came to anything. In 1581 Peter Morice, a Dutchman, fixed a water-wheel in the first arch of London Bridge on the north side, and by the aid of force-pumps forced Thames water to the top of a wooden building one hundred and twenty feet high; thence it ran through pipes to supply houses in

Thames Street and Gracechurch Street as far as Cornhill.

In 1605 the Corporation, at Myddelton's inspiration, secured an Act of Parliament to bring a "fresh stream of water to the north parts of the city of London from the springs of Amwell and Chadwell and other springs in the county of Hertford . . . by means of a trench of the breadth of ten feet and not above." And in the year following they obtained a second Act, explaining the former one, and giving them further powers. But having done thus much they stopped, and though the people of London were crying out for water, nothing was done. The fact was, the Corporation were afraid of the undertaking. The *vox populi* said the scheme was

an impossibility. They listened to *vox populi*, and for three years it seemed that nothing would be done, and that the two Acts of Parliament would be so much waste paper. However, in the year 1608, Hugh Myddelton, then a goldsmith of Basinghall Street, offered to carry out the scheme at his own cost and risk, provided all the powers conferred on the Corporation by the two Acts of Parliament were transferred to him. His offer was accepted, and on the 20th April, 1608, the work commenced.

Hugh was the sixth son of Richard Myddelton, a member of a very old Denbighshire family, and governor of Denbigh Castle during the reign of Edward VI, Mary, and Elizabeth. Richard Myddelton had several children. Charles, his fifth son, succeeded him as governor of Denbigh Castle; William, his third son, first went to Oxford and then turned sailor, and saved our fleet when sent, in 1591, to intercept some Spanish galleons off the Azores. He also translated the book of Psalms into

Turnford Pumping Station, Ch. shunt.

Welsh verse, and, lastly, he and Captain Thomas Price, of Plasiolyn, are said to be the first two who smoked tobacco publicly in London, and "that the Cockneys flocked from all parts of the city to see them." Thomas, the fourth son, was a grocer in London, and provided the Welsh nation with a new edition of the Holy Scriptures at his own expense. He was elected Lord Mayor on Michaelmas Day, 1613, the very day that saw the completion of the New River.

Hugh was born about 1555, and displayed unusual talents at a very early age. He first began to manifest his enterprising spirit by a futile search for coal within a mile of his native town, Denbigh. At the proper age he was sent to London, where his brother Thomas

Theobald's Park.

active of the citizens of London. And now we can return to his great work, and a great work it was, considering the engineering skill of those days.

When Myddelton had taken his levels he found that, though the springs at Amwell and Chadwell were only seventeen miles from the spot at Clerkenwell which he had fixed on for the reservoir, yet the course his river would have to take in order to escape some of the difficulties caused by intervening high lands and to get a proper fall and current towards London, would measure thirty-eight and a half miles. Cuttings would have to be made and embankments raised, "and," says Howe, an old writer, "the land which it was

Sluice House, Enfield.

was established as a grocer and Merchant Adventurer, and it was under this brother's care that he commenced life as a citizen by being entered an apprentice to the Goldsmiths' Company. In due course, when he had served his time, he began business on his own account in Basinghall Street, and, like his brother, he joined the prosperous Merchant Adventurers. In 1597 he represented Denbigh in Parliament, and for it he obtained a charter of incorporation. He now added cloth manufacturing to his goldsmith's business, and from the two must have derived immense wealth. On the accession of James I. he was appointed one of the royal jewellers, proving him to have been at that time one of the most prosperous and

trench thirty foot deep, and in divers other low and uncertain grounds, compelled to add thereto a second strength by force of art; and at the end of Enfield Great Park it is carried with great art over a valley between two high hills, through an open trough neere five foote wide and two foote deepe, supported by arches of wood fixed in the ground, some

Myddelton commenced his work with a will, for he set on six hundred labourers and paid them two shillings and sixpence a day. The winding canal was carried in some places through tunnels, and it crossed two wide valleys at Bush Hill near Enfield, and near Highbury, in wooden aqueducts or troughs lined with lead. The aqueduct at Bush Hill

one foot, the average depth four feet. The cost of the undertaking was enormous, and Myddelton found at length that unless he received help he should be unable to complete his task. He applied to the Corporation, but was refused. Then he turned to the king, who agreed to pay half the expenses, past and present, on condition half the cen-

The Old Sluice House, Hornsey Wood.

whereof are four and twenty foote in heighte." But not only had he natural difficulties to contend with, but the landowners

was six hundred and sixty feet in length, that at Highbury four hundred and sixty-two feet. The general descent of the stream was

cern were made over to him. To this Myddelton consented, and from the year 1611 to 1614 certain sums were paid to Myddelton on

the king's account, but what the total amount was cannot now be ascertained. However, the royal help and patronage was all Myddelton required, and on the 29th September, 1613, the work, which had cost £500,000, and lasted five years, was completed, and the water flowed into the reservoir at Clerkenwell. The ceremony of the opening is described by an old writer as follows. "On Michaelmasse day, in anno 1613, being the day when Sir Thomas Myddelton, brother to the said Hugh Myddelton, was elected Lord Maior of London for the yeere ensuing, in the afternoone of the same daye the Lord Maior of London, accompanied with the said Sir Thomas and many of the worthy aldermen, rode to see the cisterne, and first issuing of the waters thereinto, which was performed in this manner:

"A troope of labourers, to the number of sixty, or more, well appaelled, and wearing green Monmouth caps, all alike, carryed spades, shovels, pickaxes, and such like instrument of laborious employment, marching after drummes, twice or thrice about the cisterne, presented themselves before the mount, where the Lord Maior, Aldermen, and a worthy company beside, stood to behold them; and one man (in behalf of all the rest) delivered a speech commencing,

'Long have we labour'd, long desir'd, and pray'd,
For this great work's perfection,'

and ending,

'Now for the fruits, then:—Flow forth, precious
spring,
So long and dearly sought for, and now bring
Comforts to all that love thee: loudly sing,
And with thy chrystal murmurs strook together
Bid all thy wel-wishers welcome hither.'

At which words the flood-gates flew open, the streame ranne gallantly into the cisterne, drummes and trumpets sounding in a triumphall manner, and a brave peale of chambers gave full issue to the intended entertainment."

Myddelton had conquered, and the New River had reached London. From the reservoir it was taken down in pipes of wood (made by boring out the centres of young ash trees) to the City, and supplies to houses were laid on, on payment of yearly rents by the owners. Some of the old wooden pipes are dug up even now, and are found in an excellent state of preservation. On the 21st June, 1619, the shareholders were incorporated by the king under the title of "The Governor and Company of the New River brought from Chadwell and Amwell to London," and Hugh Myddelton was appointed the first governor. At the commencement the Company did not prosper, and calls were made on the shareholders, and in the year 1631 Charles I., who then held the king's moiety of shares, resold them to Sir Hugh, who had been knighted in 1622, for a yearly payment of £500, which payment is continued to the present day. The property of the New River Company was divided into seventy-two shares; thirty-six were originally vested in Sir Hugh, and they are known as "adventurers' shares," and thirty-six, which the king bought and afterwards resold, known as "king's shares." At present there is no more prosperous company than that of the New River, and Sir Hugh probably had no notion to what success his project would attain in after years. In the year 1633, for instance, the dividend on a share was £15 3s. 4d., in 1857 it was £876. The value of a share in 1881 was about £20,000.

The original springs proved inadequate for the increased demand, and the New River Company now derives its supply from the Chadwell Spring, from the River Lea, from four wells, one at Amwell, one at Cheshunt, one at Hampstead, and one in the Hampstead Road; and for street-watering purposes the seven ponds at Hampstead and the seven ponds at Highgate are also laid under con-

tribution. The course of the stream has also been shortened, so that the New River of the present day is only twenty-eight miles long. Sir Hugh died in 1631, and was buried in the churchyard of St. Matthew in Friday Street.

RECENT ATHLETICS.

(Continued from page 383.)

THE best hundred and twenty yards' time for the hurdles is Jackson's 16sec. Jackson, however, was never champion. The honour was won four times by Palmer, three times by Upcher, twice by Stirling and Lawrence, and once each by Milvaire, Law, Tennant, Nunn, Garnier, Loder, Reay, and Gouthorpe. The slowest of the championship times is Nunn's, 18½sec.; the fastest Palmer's, 16½sec. In 1881 Lawrence is also accredited with 16½sec.

The best high jump is Davin's, 6ft. 2½in. Davin was champion in 1881, but he then cleared only 6ft. 0½in. This height, also attained by Parsons in 1883, has never been exceeded at a championship meeting; even 5ft. 2in. has made a champion jumper. The high jump championship was won three times by Mitchell, and twice by Brooks, but in all other cases by single event men.

Mitchell also won the pole-jump on three occasions; but our best pole-jumper is Ray, of Ulverstone, who has also won it thrice, and for his performance of 11ft. 3in. in 1881 holds the record. The pole-jump was twice won by H. W. Strachan; the other winners have been Wheeler, Moore, Graham, Felloses, Kelsey, Woodburn, Kayll, Robinson, and Cobbold. In Robinson's year, 1879, there appeared the mysterious letters, j. o. = jumped over.

The best wide jump is Davin's 23ft. 2in., but in 1881, when he was champion, he only cleared 22ft. 11½in.; thus the best of the championship jumps is that of Parsons in 1883, with 23ft. 0½in. The champion jump has been as low as 19ft. 4in. Lockton was champion three times, and so were Davies and Mitchell, if we count the tie in 1871 as a win to both. Fitzherbert was twice champion, and so was Alkin. The other jumpers have been Tosswill, Baddeley, Elliott, Malone, and Horwood. The latter was last year's champion.

Hammer-throwing is a mysterious art, somewhat pleasingly varied in its results. In 1866 the championship was won by James with 78ft. 5in.; in 1874 Brown required 120ft. to win it. Hales won it twice, his best throw being 110ft. in 1877. Hales holds the record for throwing the hammer with an unlimited run—138ft. 3in. With a 7ft. run and no follow, Hart holds the record with 110ft. 8in., and a certain Queckberner is reported from New York to have whirled the sixteen-pounder 96ft. 1½in. without either a run or a follow. Hales was twice champion, so was Baddeley. Leeke was champion three times, so was Burgess. The other hammerers have been Halket, Patterson, Lawrence, M. Davin (not the jumper), Gruer, and Hart. Hart holds the record, as we have seen, with 110ft. 8in.; when he won the championship last year he only succeeded in throwing 83ft. 5in.

Weight-putting is another occupation of uncertain character. The best on record is Maxwell's 43ft. 5in.; the worst on champion record is Leeke's 31ft. 4½in. Stone, of Liverpool, has been champion weight-putter no less than five times; Mitchell gained the honour twice, so did Bor, so did Winthrop. The other putters have been Fraser in 1866, when by a mistake an 18lb. 10oz. weight was substituted for the usual sixteen-pounder, Leeke, Moore, East, Davin (the hammer-thrower), and Ross, of Patricroft.

We may appropriately close with a few sundries. The best hop-step-and-jump is

45ft. 4in. by Daly, at Cork, in 1873; the best vault over a fence is Atkinson's 7ft. 3½in. in March last year; and the best hopping a hundred yards, 14½sec., is that of See, another Yankee, at New York in 1883. We have not touched on walking for the reason that it is very difficult to say where match-walking ends and match-running begins; and we have said nothing of cycling, preferring to leave it for another occasion.

(THE END.)

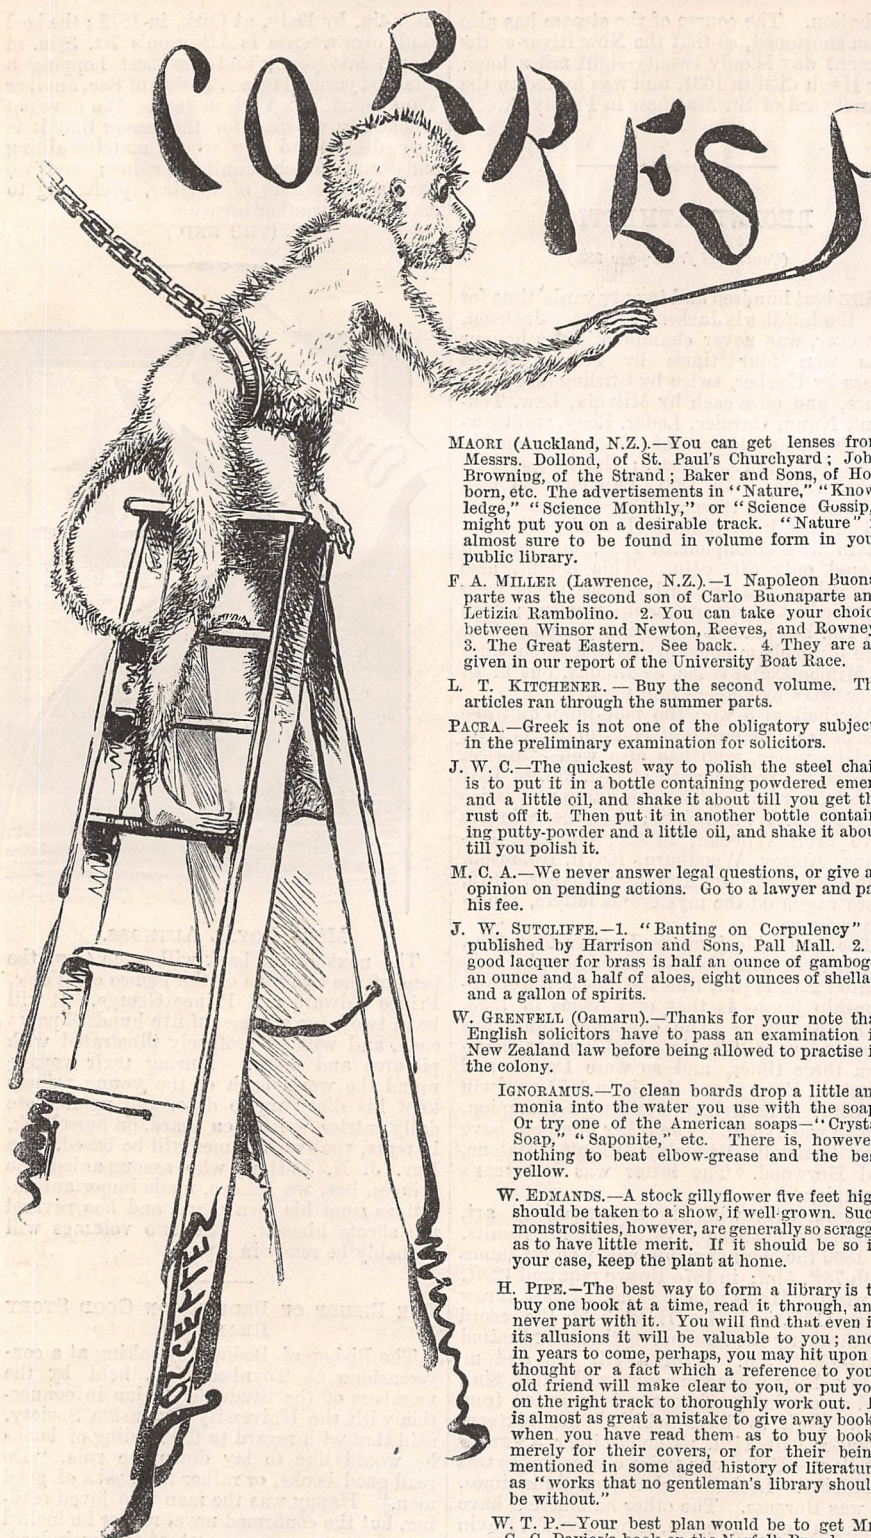

MORE ROYAL AUTHORS.

The next Royal book will come from the pens of the two sons of the Prince of Wales, Prince Edward and Prince George. It will be in two large volumes of five hundred pages each, and will be profusely illustrated with pictures and maps. During their voyage round the world each of the young princes kept his diary up to date, and upon these daily entries, written on board, on horseback, in tents, the two volumes will be based. The Rev. J. N. Dalton, who accompanied the princes, has, we believe, made important additions from his own diary, and has revised the sheets himself. The two volumes will probably be ready in April.

THE BISHOP OF BEDFORD ON GOOD STORY READING.

The Bishop of Bedford, speaking at a conversazione at Toynbee Hall, held by the members of the Students' Union in connection with the University Extension Society, said that with regard to the reading of books he would like to lay down the rule, "Do read good books, or rather the books of good men." Happy was the man who loved reading, but the confirmed novel reader he looked upon as a very poor sort of fellow indeed, who he thought would never do much good in the world. But because this was true it must not be thought that he despised good stories. He had heard people object to stories because they were not true. That was a very funny objection, for if they took an ordinary volume of history it was no truer than a good novel. Histories gave them facts, and so did many stories; but there was not always the strictest truth in the former as to the motives that brought about the facts, whereas a good story had its whole force and power in its truthfulness of nature; in its setting forth with accuracy those lines of character which it was profitable to study. This is the kind of story that the BOY'S OWN PAPER ever seeks to place before its readers.

MAORI (Auckland, N.Z.).—You can get lenses from Messrs. Dollond, of St. Paul's Churchyard; John Browning, of the Strand; Baker and Sons, of Holborn, etc. The advertisements in "Nature," "Knowledge," "Science Monthly," or "Science Gossip," might put you on a desirable track. "Nature" is almost sure to be found in volume form in your public library.

F. A. MILLER (Lawrence, N.Z.).—1. Napoleon Buonaparte was the second son of Carlo Buonaparte and Letizia Ramolino. 2. You can take your choice between Winsor and Newton, Reeves, and Rowney. 3. The Great Eastern. See back. 4. They are all given in our report of the University Boat Race.

L. T. KITCHENER.—Buy the second volume. The articles ran through the summer parts.

PACRA.—Greek is not one of the obligatory subjects in the preliminary examination for solicitors.

J. W. C.—The quickest way to polish the steel chain is to put it in a bottle containing powdered emery and a little oil, and shake it about till you get the rust off it. Then put it in another bottle containing putty-powder and a little oil, and shake it about till you polish it.

M. C. A.—We never answer legal questions, or give an opinion on pending actions. Go to a lawyer and pay his fee.

J. W. SUTCLIFFE.—1. "Banting on Corpulency" is published by Harrison and Sons, Pall Mall. 2. A good lacquer for brass is half an ounce of gamboge, an ounce and a half of aloes, eight ounces of shellac, and a gallon of spirits.

W. GRENFELL (Oamaru).—Thanks for your note that English solicitors have to pass an examination in New Zealand law before being allowed to practise in the colony.

IGNORAMUS.—To clean boards drop a little ammonia into the water you use with the soap. Or try one of the American soaps—"Crystal Soap," "Saponite," etc. There is, however, nothing to beat elbow-grease and the best yellow.

W. EDMANDS.—A stock gillyflower five feet high should be taken to a show, if well-grown. Such monstrosities, however, are generally so scraggy as to have little merit. If it should be so in your case, keep the plant at home.

H. PIPE.—The best way to form a library is to buy one book at a time, read it through, and never part with it. You will find that even in its allusions it will be valuable to you; and, in years to come, perhaps, you may hit upon a thought or a fact which a reference to your old friend will make clear to you, or put you on the right track to thoroughly work out. It is almost as great a mistake to give away books when you have read them as to buy books merely for their covers, or for their being mentioned in some aged history of literature as "works that no gentleman's library should be without."

W. T. P.—Your best plan would be to get Mr. G. C. Davies's book on the Norfolk Broads.

E. A. N.—Student interpreters in China, Japan, and Siam receive a commencing salary of £200 per year.

C. F. C., JR.—An Italian warehouse is so called from the fact of the shops of which it is a development having been stocked with oil and pickles and petty groceries, in the fashion of the country from which it took its name. The grocery and oil-and-pickle trades were at first distinct.

E. W. W.—The £ is the initial of Libra=pounds; the s. is the initial of solidi=shillings; the d. is the initial of denarii=pence.

NAVAL SURGEON.—Up to a certain point the course of study is the same as that for an ordinary practitioner. Candidates have then to pass an examination, and are selected for the service. Full particulars can be had from the medical department.

S. S. ICENIE.—You must not fly the flag of a club of which you are not a member; and you must not fly an ensign with a device on it unless you belong to a club that has obtained the Admiralty's permission to do so.

A CALIFORNIAN MYSTERY.—We are not responsible for the opinions of "other papers." If you doubt that you weigh more after a meal than before it, a very simple experiment will enlighten you. Your argument simply leads you to the conclusion that the more you eat the less you weigh, and you have only to keep on eating to weigh nothing. As to "the air displaced by the food weighing more than the food which has taken its place," apart from the difficulty of getting our food down, we should if it were true have our legs of mutton flying upwards like balloons, and be obliged to keep our joints and puddings guyed to the tablecloth to prevent their shooting off into space.

R. S. S. GRANT.—Nothing is definitely known of Andrea Ferrara. The number of blades marked with his name is, however, so great that it would seem to have been merely a trade mark. Solingen is the name of a German town.

C. CAMPBELL.—In the April part for 1880 you will find three plans of a full-rigged ship—one giving the sails, one the masts and spars, and one the rigging.

JASON.—Much obliged for your official description of the arms of the Salters' Company. We transcribe in full: "Per chevron azure and gules three covered salts, or, springing salt proper. On a helmet and torso issuing out of a cloud argent, a sinister arm proper holding salt as the former. Supporters two 'otters' argent platée, gorged with ducal coronets, thereto a chain affixed and reflected or."

PISCATOR.—And you have an advantage over the weekly readers in getting your plates before the end of the year. It is a question of give and take. Why not purchase the first weekly number of each part for your special use, and give it away when done with to some poorer lad?

PROSPECTUS.—For the "Art Directory," price sixpence, giving all information regarding the schools and examinations in connection with the Science and Art Department, apply to the Secretary of the Department, South Kensington, S.W. Postage-stamps should be enclosed, to defray cost and postage. A Science Directory is also issued, giving particulars of the Science Schools. Its price is also sixpence.

R. CLARK.—Your best plan would be to buy an Army List. It is published by John Murray, Albemarle Street, and obtainable through any bookseller.

ALMA.—A "Football Annual" is published, giving the addresses of the principal clubs. You can get it at any athletic sports shop.

BRUNSWICK BLACK.—Better buy it. Brunswick black is made of asphaltum, oil, litharge, and turpentine, and is quite unsuitable for home manufacture.

M. W. THOMPSTONE.—See the index of the last four volumes, and read our articles; or get Biddle's "Model Yacht Building," price five shillings.

C. G. S.—To black-bronze brass clean it first in aquafortis, and rinse it well in clean water. Then immerse it in a mixture of one part of each of sulphate of iron and white arsenic to twelve parts of aquafortis. Rinse it in water; dry it in sawdust; polish it with blacklead, and lacquer it. If you want merely to blacken it, mix lampblack with gold-size, and add a little turpentine.

OOLOGIST.—Get the second volume. It contained a series of articles on birds' eggs, illustrated with a coloured plate.

A. A. ANDERSON.—The best way to mark your pigeon is to use an indiarubber stamp, and impress your name on one of the wing feathers. This is the plan adopted by most flying clubs.

PADDY.—"Practical Canoeing" costs four shillings. "Boat Sailing for Amateurs" costs five. The latter is published at 170, Strand.

A. C. FEW.—There are many such books, for lists of which apply to some nautical warehouse, such as Norie's in the Minorities, Potter's in the Poultry, etc. One is published by Trübner and Co., Ludgate Hill, price seven shillings and sixpence. Its title is "The Young Seaman's Manual," by Captain Burney, of Greenwich Hospital Schools.

OCEAN WAVE.—"Maggie Miller" is the surge under the bows. Lazy sailors sometimes hang their clothes in it to wash without trouble to themselves, and not seldom they have the joy of finding them washed away entirely!

WHITE VIOLET.—Trapping is still carried on in the Far West. See Baillie-Grohman's "Camps in the Rockies," published by Sampson Low and Co.

ROGATOR.—1. A child born in England is English, but it can claim its father's nationality. 2. The hall-marks were given in the May part for 1881, on page 488.

ROLLO THE ROVER.—You will find the relative rank given in the article on Navy Ranks in the February part for 1884.

C. VERMONT.—1. All extracts must bear the name of the paper, not exceed a reasonable length. 2. The numbers are not kept; only the parts.

PLING PLONG.—1. The I in I Zingari is the Italian article menzi "the." "I Zingari" are the wanderers or the gipsies. 2. Cannot say unless you describe the symptoms at length.

J. McCUTCHEON.—We would strongly dissuade you from attempting to make fireworks at home; the doing so may bring you into trouble with the police.

AN ANXIOUS LIVERPUDLIAN.—1. The first volume has been reprinted, and sells at six shillings. 2. For a cheap first book of mineralogy try that of J. H. Collins, price one shilling, published by Messrs. Collins and Sons; or that by Frank Rutley, published by Murby, of Ludgate Circus, at two shillings. The larger works are of course more expensive.

LUMINOUS.—The London agents for Balm's luminous paint are Messrs. Hlee and Home, 31, Aldermanbury, E.C. You can get it in small quantities. Harbour buoys and fishing floats have been painted with it.

WORDS OF CHEER.

OUR TRAINING SHIPS.—In the "Eastern Morning News," published in Hull, we find a report of a lecture delivered on board the Southampton, stationed in the Humber. The report concludes: "After the lecture the boys resumed their amusements, some playing draughts, some dominoes, and others reading the only paper allowed on board, viz., the B. O. P."

No. 324.—Vol. VII.

SATURDAY, MARCH 23, 1885.

Price One Penny.

THE HEROES OF NEW SWISHFORD:

A SCHOOL EPISODE
IN FOUR CHAPTERS.

BY THE AUTHOR OF

"My First Football Match," etc., etc.

CHAPTER III.—CONSTERNATION.

THE Eliza, for that was the name of the coastguard's boat on which our heroes had embarked, was a middling-sized sea-going rowing boat, which, if it was just big enough by a little judicious packing to hold the seven voyagers, could certainly not have accommodated more.

While Gayford with the dexterity of an experienced bargee shoved the boat along out of the creek, Bowler took upon himself the care of trimming the "ship" and stowing away all the baggage.

"As soon as we get out," said he, "we'd better lie down on the floor, in case the coastguards see us."

"Not much chance of that," replied Gayford, "they never get up till eight, and by that time we shall be half way across."

"Suppose they spot us and give chase," said Wallas, "what a row we shall get into."

"They've not got a boat, I tell you, and I don't believe there's one they can get either," said Bowler.

The Heroes in Doleful Plight.

"But they're sure to be on the look-out for us when we get back to-night."

"Let them. It'll be dark at six, and we can land in Rocket Bay, you know, and dodge them that way."

Bowler was evidently so well up in the arrangements, and had made such a careful study of all the pros and cons of the venture, that every one felt satisfied, and even the somewhat doubtful Wallas desisted from throwing more cold water on the expedition.

It was a raw morning with a little bit of a fog, and a cool breeze right off the land. This last point, however, gave great satisfaction to the leaders of the party. Once out in the open they would be able to hoist sail, and without the exertion of rowing make a straight track for the Long Stork—much indeed as would be the case when, with a southerly wind at their backs, they would before long plough the ocean from Sinnamary to New Swishford.

The fog also was decidedly in their favour, for it would help to screen them from the observation of any wakeful and inquisitive coastguard. In fact the unusual combination of wind and fog seemed like a special sign of good omen to their adventure.

"Hope it's not wough outside," said Braintree, as the boat, now nearly out of the creek, began to dance a little at the prospect of meeting the open sea.

"Can't be rough with the wind off the land, you duffer," said Crashford.

"Can't it, though?" said Wester, as a wave lifted the prow of the boat and nearly sent it back on the rocks.

"I call that vewy wough," said Braintree, looking and feeling a little uncomfortable.

"Oh, it's only the ground swell," said Gayford; "we shall soon get out of that. Here, Bowler, old man, take an oar with Tubbs and keep way on while I stick up the sail. Look alive."

With some difficulty the oars were got out, and Tubbs made to comprehend what was expected of him. But comprehending was one thing with Tubbs, and doing was another thing. Just as he settled down to his oar another wave lifted the boat and Tubbs with it, who clung wildly to the seat with both hands, leaving his oar to its fate. Luckily Crashford was near enough to make a grab at it before it went, or the beginning of the expedition might have been marked by a serious catastrophe.

The unhappy Tubbs having been shunted, Crashford took his place, and with Bowler kept the boat's head steady till Gayford hauled up the sail and the Eliza began of her own accord to fly through the water.

At the sight of the majestic sail swelling with the wind, and, still more, on perceiving a decided improvement in the pitching of the boat, the spirits of the party rose again, and Braintree actually began to hum "Wule Bwitannia."

The cliffs of Raveling loomed dimly out behind them, and ahead they could just discern the faintest outline of the land of their adoption.

"Upon my word," said Bowler, "this is jolly. It's just like the real New Swishford, isn't it, you fellows?"

"Warthah," said Braintree, "except my wife to let fly at the seagulls with."

"But," said Wallas, "if the wind's off the land this side, it will be off the sea when we get over there, so I suppose it'll

get rougher and rougher the farther out we get?"

This ominous suggestion had the effect of immediately damping the spirits of half the party, and Bowler and Gayford found it difficult to restore confidence in the much-abused ocean. The ocean, however, went some way to restore confidence in itself. For though it still continued restless enough to keep Braintree and Tubbs in a state of suspended enjoyment in the bows, it showed no signs of getting worse as it went on.

Bowler was jubilant. With his hand on the rudder and his eye on the compass, he kept the boat's course like a line, and fancied himself heading due north from Sinnamary. Gayford, with the sheet in his hand, and a careful watch on the sail, could easily delude himself into fancying the coast-line of the Long Stork was the veritable shore of New Swishford.

"Isn't it prime, old man," said he, "and won't it be primer still when the real time comes? I never guessed it would be so easy. Not a thing's gone wrong."

"No, and think of the lark of landing and collaring the island, too. I say, who does the Long Stork belong to?"

"Don't know—the Long Storks, I guess. They're the only inhabitants I ever heard of."

"Well, I'm sorry for them. But, I say, Gayford, it's just as well we have got some grub on board, for there's not much sign of forests and game and all that sort of thing here."

Not much indeed! Long Stork Island was a barren rock about a mile long and half a mile wide, with a few scraggy patches of grass on its uninviting slope. No living creatures but the wild seabirds patronised it in the winter, when the waves lashed over the island and sent their salt spray from one end to the other. Even they seemed to avoid it. But beggars cannot be choosers, and as the Long Stork was the only island of our heroes' acquaintance within reach, they had to take it as it was and make the best of it.

A decided sea was running on the landward side of the island as they approached it, and even such inexperienced navigators as Bowler and Gayford could see that there would be some difficulty about effecting a quiet landing.

"Better go round the other side," said Gayford, "it'll be quiet enough there out of the wind."

So the boat's nose was put out to make a circuit of the Long Stork.

"Look out, I say," said, or rather groaned, Braintree from the bows. "Don't make the boat woll. Why can't you win her stwait in the way you—"

His further observations were cut short, and during the rest of the time that the Eliza was rounding the stormy cape he and Tubbs and Crashford were in a decidedly pensive mood.

At last the circumnavigation was accomplished, and in tranquil water the boat cruised along under the sheltered shore of the island. The sail was lowered, oars were put out, the invalids sat up, and Bowler, standing up in the bows, scanned the coast for a likely landing-place.

He had not to search long. A little natural pier of rock ran out invitingly, alongside which the boat was slowly and triumphantly brought.

"Now, you fellows," said Crashford, "here goes for first on shore. Out of the way, Tubby. Hurrah for New Swishford!" And he leapt on shore, half capsizing the boat as he did so.

Bowler found his authority unequal to the task of controlling the enthusiasm of his fellow-emigrants, and he had to let them land as they pleased, while he and Gayford grimly held the boat alongside.

When all but Tubbs were ashore their patience could hold out no longer. They followed the general rush, Bowler crying out to Tubbs as he sprang ashore.

"See and make her fast Tubbs, and land the grub, will you? We'll be back directly." And off he scampered with the rest to join in the ceremony of capturing the island.

Now Tubbs was not the best man who could have been chosen to execute so important a trust as that laid upon him; and Bowler, had he been rather less excited at the moment, would have thought twice before he left him to perform it. In the first place Tubbs could find no place to tie the boat up to, and as long as he sat in the boat and held on to the rock it was evident he could not land the grub. So he was in a dilemma. He did his best. He relaxed his hold for a moment and made a frantic grab at one of the brown-paper parcels. But it almost cost him his moorings, for the boat, taking advantage of its liberty, began to slide away out to sea, and it was all Tubbs could do to catch hold of the rock again in time to stop it. This would not do, it was clear. He pulled the boat along to its old position, and throwing the parcel ashore, meditated. He must wait till one of the others came to help him. Poor Tubbs! It was hard lines to see the rest of the party scrambling triumphantly up the hill, and find himself left here like a sort of animated anchor. Happy thought! How came he never to have thought of the anchor before. There it was in the bottom of the boat. It would be the simplest thing to jump ashore with it and fix it somewhere in the rocks where it would hold. No sooner was the brilliant project conceived than it was executed. Seizing the anchor in his hands, Tubbs stepped gaily ashore and triumphantly wedged one tooth of it into a crevice of the rock where it would hold firm enough to keep a man-of-war in its place. He watched with a pleasant smile the Eliza as she drifted slowly out on the rope, enjoying the prospect of seeing her presently tug at the anchor, and then give up the attempt to get free and resign herself to her fate.

It was a longer coil of rope than he had imagined. The boat was twenty yards away at least, and still paying out. By the way, where was the rope? With a cry of horror Tubbs sprang to the anchor and began hauling in. The rope came in gaily, but not the Eliza! She danced merrily out to sea in a straight line for the north pole, with the six brown-paper parcels on board, leaving her poor custodian to console himself as best he could with a loose end of rope which had never been fastened to its ring.

What was he to do? After taking a few minutes to collect his ideas, by which time the boat was a hundred yards on its solitary voyage, it occurred to him he had better inform the others of what had happened. So he started in rather a

low state of mind in pursuit of them. It was a long time before he came upon them, perched in a group on the highest point of the island and singing "Rule Britannia" in a lusty chorus which sent the scared seagulls flying to right and left.

"Hullo Tubby, old man, here we are. Got the grub safe ashore? Not been bagging any of the peaches, eh? You've been long enough."

Tubbs replied by pointing mysteriously to a little speck out at sea.

"What's the row? What is it?" asked Gayford.

"You wouldn't guess what that little thing is," said Tubbs.

"What is it? Can't you speak?"

"Well, if you must know, it's our boat. The anchor wasn't tied, you know."

"The boat! You great booby!" cried one and all, springing to their feet and rushing in the direction of the pier, upsetting and trampling over the unhappy Tubbs as they did so.

"What on earth shall we do?" gasped Gayford, as he ran by Bowler's side.

"We must swim for it," said Bowler.

"It's our only chance."

"Can't do it. She's half a mile out."

"It's all up with us if we can't get her," groaned Bowler.

They reached the landing-stage, and there, sure enough, danced the Eliza half a mile out at sea.

"I'll try it," said Bowler, flinging off his coat.

"What, to swim? You'll do nothing of the sort," said Gayford, seizing his friend by main force.

"I tell you it's our only chance," cried Bowler. "Let go, do you hear?"

"No, I won't, old man. We must make the best of it. It'll be more like New Swishford than ever now."

This last argument had more effect with Bowler than any other, and he slowly put on his coat.

"I vote we souse that idiot, Tubbs, till he's black in the face," said Crashford, viciously.

"What's the use of that?" asked Bowler.

"The fact is, you fellows," said he, "we're regularly in for it now, and the sooner we make up our minds what we shall do the better."

"Let's make a raft," said Braintree, mindful of his "Wobinson Cwosoe."

"Where's your wood?" asked Wallas.

"Let's hoist a signal, anyhow," said Wester.

"No one to see it if you do," said Wallas.

"Let's have some grub," said Crashford.

This last suggestion met with general approval. They had had no breakfast to speak of, and after their voyage and excitement hunger was beginning to assert itself. The one brown-paper parcel rescued from the Eliza was forthwith handed in and pronounced common property. It happened to be the parcel bearing Tubbs's name, and contained, besides a seventh part of the provisions, Tubbs's voluntary contributions to the general store—namely the crib to Sallust and the guide to the environs of Tunbridge Wells. These it was proposed and seconded should be handed over to the owner as his share of the good things contained in the parcel, but Bowler and Gayford interfered on his behalf, and after having been reprimanded with a severity that took away his appetite, he was

allowed to partake of a portion of potted shrimp and a potted peach, together with a small slice of cake. Bowler groaned to see what a hole even this frugal repast made in the provisions, and consulted Gayford in an undertone on the possibility of slaying a seagull and the merits of raw poultry generally.

Rather dolefully the provisions were packed up and deposited in a ledge in the rocks while the party proceeded to wander about the island in search of board and lodging. The charms of Long Stork Island had fallen off greatly in the short interval, and the sea fog which was beginning to wrap it round and hide the mainland from view seemed like a wet blanket both on the spirits and persons of the adventurers.

After much dreary search a hollow was found on the hillside, which by fastening together three or four ulsters might be roofed over sufficiently well to keep out the rain or cold if required. As to food, the island provided absolutely nothing except the chance of raw poultry already mentioned and a few shell-fish on the rocks.

The day wore on and the fog turned to drizzle and the drizzle to rain. They held out against it as long as they could, but had to take shelter at last and herd together in their extemporised cabin.

Here a painful discussion ensued.

"I hope you're satisfied now," growled Wallas. "This is mess enough to please even you, Bowler."

"What do you mean?" retorted Gayford; "a lot you've done for the public good. There are plenty of seagulls about without you to croak too."

"I wish my umbwellah hadn't gone out to sea," observed Braintree, shivering.

"By the way," said Crashford, "didn't I see it lying on the rocks? I'll just run and see," and off he started.

"When shall we ever get away?" asked Wester. "We may get starved here."

"They're sure to see us or find us out in a day or two," said Bowler.

"A day or two!" exclaimed Wallas; "do you really mean we've got to stay here without food or shelter a day or two? I wish your New Swishford was in the middle of the sea."

"So it is," drily observed Bowler.

"Fine fools you've made of us with your humbug and child's play," growled the other.

"You don't want much making," re-

torted Bowler; "and if you want to talk any more you can talk to some one else."

Wallas accepted the invitation and growled all round till everybody was sick of him.

After a long absence Crashford returned without the umbrella.

"I couldn't find it," said he, sitting down. "It's gone."

"But you found the peaches, you blackguard!" said Bowler, springing up and pointing to some juicy remains still clinging to the delinquent's coat. And in his righteous indignation he dealt the traitor a blow which sent him out of the tent.

A fight ensued there and then between Bowler and Crashford, unhappily to the disadvantage of the former, who was no match for the practised hand opposed to him. The company interposed after a few rounds, and none too soon for the damaged though still lion-hearted Bowler.

Crashford profited nothing by his victory, for it was decided unanimously to exclude him from the tent till he chose to apologise for his treachery, and meanwhile the remains of the slender provisions were taken into safe custody out of his reach.

The day wore on and the rain fell heavier and heavier upon the ulster roof over their heads. The wind whistled drearily above them, and the mainland was entirely lost to sight. As far as they were concerned they might be in the real New Swishford a thousand miles from the nearest land.

They huddled together silently, no one caring much to speak. Only Braintree broke the monotony by shivering audibly, and the footsteps of Crashford, as he paced up and down outside to keep warm, added a dreary variety to the silence.

The afternoon drew on, and at last Bowler said,

"Better let the beggar in."

"Haden't we better all turn out and see what's to be done?" said Gayford. "We shall only come to grief here. The grub won't hold out for another meal, and then it'll be something more than a joke."

"Come on then, you fellows," said Bowler. And the roof was hauled down and the party turned dismally out once more to seek their fortune.

(To be concluded.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XXIV.—THE FATE OF THE STAR.

THE effect of the engineer's speech was truly gratifying. Its complete disinterestedness touched the not very sensitive hearts of the guests, and there was a round of noisy applause.

Alice, with her eyes cast down and her heart beating violently, seemed the only one that betrayed no surprise at her lover's proceedings; and she remained silent by her father's side.

Watkins, still crushed by his terrible misfortune, raised his head. He knew enough of Cyprien to know that if he gave him his daughter her happiness would be assured, but he would not yet admit that he saw no objection to the marriage.

Cyprien, confused at the publicity to which his ardour had committed him, grew conscious of the strangeness of the position, and wished he had remained more master of his feelings.

The silence of mutual embarrassment was ended by Vandergaart, who stepped towards the farmer.

"John Watkins," said he, "I do not wish to abuse my victory, and I am not one of those that strike a man when he is down. In vindicating my right I have only done my duty. But I know by experience that right may sometimes border closely on injustice, and I do not wish to visit your sins on the heads of those who are innocent. Besides, I am alone in the world, and not so very far off my grave. What is the use of so much wealth if I cannot dispose of it? If, Watkins, you agree to the match between these two youngsters, I will give them the Star of the Settlement as a wedding present! And I will make them my heirs; and thus, as fully as I can, repair the involuntary injury I have done to your daughter!"

At these words a murmur of sympathetic interest ran round the assemblage. Every one looked at John Watkins. His eyes seemed to glisten as he shaded them with his trembling hand.

"Jacobus Vandergaart!" he cried, unable to restrain the tumultuous feelings which agitated him. "Yes! You are a real good fellow, and in thus ensuring the young people's happiness you have nobly avenged the wrong I did you."

Neither Alice nor Cyprien could find words to reply, but their looks spoke for them. The old man held out his hand to his enemy, and Watkins clasped it eagerly. And every eye was moist; even the old police-sergeant, who looked as dry as an Admiralty biscuit, found it necessary to cough and use his handkerchief.

Watkins seemed quite a different man. His expression had changed to be as kindly and gentle as it had hitherto been hard and heartless. And Vandergaart had resumed his wonted look of placid good-nature.

"Let us forget and forgive," said he, "and let us wish the young couple every happiness."

And the storm having thus passed away, Vandergaart took his place at the

table, and began to talk to Watkins of his plans for the future.

"Let us sell everything and go with the youngsters to Europe. We could settle near them, do some good with our money, and end our days in peace."

Meanwhile the temperature continued to rise, the air becoming more and more oppressive, and converting the guests into so many electrical machines. In vain the windows and the doors were thrown open. Not a breath caused a candle flame to flicker. Such pressure could only end in one way—there would be a storm, with heavy thunder and torrential rain, and the relief that the storm would give was eagerly awaited.

Suddenly a blinding flash threw a sickly tint over all, and instantly the roar of the thunder, as it rolled over the plain, announced that the concert had begun.

At the same moment a furious squall burst into the room and blew out all the lights. Then the cataracts of heaven were opened, and the deluge commenced.

"Did you hear that sharp click after the thunderclap!" asked Thomas Steel, while the windows were being shut and the candles relighted. "I thought a glass globe had cracked."

Immediately all eyes instinctively turned towards the Star of the Settlement.

The diamond had vanished!

But neither the iron cage nor the glass globe that covered it had changed its position. It was manifestly impossible that any one could have touched it.

The phenomenon seemed to verge on the miraculous. Cyprien eagerly leant forward, and noticed on the velvet cushion, in place of the diamond, a little mound of ashy powder.

He could not restrain a shout of surprise, and in a word told what had happened.

"The Star of the Settlement has crumbled into dust!"

Every one in Griqualand knows that this curious property is peculiar to the diamonds of the district. Though not often mentioned, it is nevertheless true that, owing to some hitherto unintelligible molecular action, the most precious of the gems will sometimes fly to pieces like a bombshell, and leave nothing behind but a tiny pinch of dust, that may or may not be of use for industrial purposes.

The engineer was evidently thinking more of the scientific interest of the accident than of the enormous pecuniary loss it meant for him.

"What is very curious," he said, while all looked on amazed, "is not so much that the stone has crumbled up, but that it should have waited till to-day to go off. Diamonds generally break up so much sooner after cutting. About ten days is the usual time, is it not, Mr. Vandergaart?"

"That is so, and it is the first time in my life that I ever saw a diamond go three months after it had been cut!"

said the old man, with a sigh. "You see it was destined that the Star of the Settlement should belong to nobody. When I think that we might have prevented the disaster had we given the diamond a trifling coat of grease—"

"Really?" exclaimed Cyprien, with the satisfaction of a man who at last sees a way out of a difficulty. "Then I can explain it all. The poor fragile Star received the coating of grease in Dada's gizzard, and that is why it lasted till to-day. It might have been much better if it had gone to pieces four months ago and saved us our scamper across the Transvaal!"

Watkins seemed very ill at ease in his arm-chair, and now he broke out with—

"How can you take things so coolly? There you are talking about the millions gone in smoke as if they were only a cigarette!"

"That shows we are philosophers," said Cyprien. "There is nothing like being wise when wisdom has become a necessity."

"Philosophers if you like," said the farmer. "But millions are millions, and you don't pick them up every day. Ah, Jacobus! you have done me a greater service than you think. I am afraid I should have gone off like a bombshell had the Star still been mine."

"Why should it matter?" said Cyprien, with a tender look at Alice's sunny face. "I have this evening won so precious a diamond that the loss of no other can trouble me."

And thus ended, in a way well worthy of its brief and troubled history, the career of the largest cut diamond the world has seen.

Such an ending could not but confirm the superstitions afloat in Griqualand. More than ever the Kafirs and diggers felt assured that large diamonds brought nothing but ill luck.

Vandergaart, who had been so proud to cut it, and Cyprien, who dreamt of giving it to the School of Mines, were at heart much more disconcerted at the diamond's destruction than appeared on the surface. But the world could well spare it, and there was no good to be gained by making unnecessary fuss.

Nevertheless, this accumulation of startling events and strange emotions, the loss of his fortune, followed by the loss of his diamond, had a serious effect on John Watkins. He took to his bed, lingered for a few days, and then died. Neither the devoted care of his daughter, the efforts of Cyprien, nor the exhortations of Jacobus Vandergaart, who took his place by his bedside and did his utmost to encourage him to battle against the attack, proved able to avert the blow. In vain the old lapidary talked of his plans for the future, told him how he intended to make him a partner in the ownership of the Kopje, asked his advice on its future management. The old farmer had received a crushing blow to his pride, his avarice, his egotism, and his

whole idea of life, and he felt that his end had come.

One evening he called Alice and Cyprien to him, joined their hands, and without a word breathed his last. He had survived his cherished Star but a fortnight.

And in truth there seemed to be some intimate connection between the fate of the farmer and that of the wonderful gem, though the coincidences admitted of reasonable explanation without recourse to the superstitious notions that were current in Griqualand. The Star of the Settlement had "brought ill-luck" to its owner in the sense that its arrival had marked the beginning of his declining prosperity.

But what the wiseacres of the camp did not see was, that the real origin of the "ill-luck" lay in the faults of John Watkins himself — faults which bore within them the seeds of grief and ruin. Many of the misfortunes of this world are attributed to mysterious "ill-luck" when in reality they are due to the misconduct of those who bear them. If John Watkins had been less attached to lucre, and had not assigned exaggerated and almost criminal importance to the little carbon crystals known amongst men as diamonds, the discovery and disappearance of the Star of the Settlement would have affected him as little as it did Cyprien, and his health, physical and moral, would never have succumbed to a mere attack on his pocket. But his whole heart was in diamonds, and through a diamond he died.

A few weeks later the wedding took place. Alice was now Cyprien's wife; what more could he desire in this world?

And the young engineer was richer than he supposed.

By the discovery of the famous Star the value of his claim had been greatly increased, and during his absence on the expedition across the Transvaal, Steel, who had remained in partnership with him, had worked away most energetically and successfully. The yield was a very fair one, and when Cyprien sold his share it realised between four and five thousand pounds.

Alice and Cyprien, before setting out for France, took care to provide for Li, Bardik, and Matak, and in this Vandergaart insisted on helping. The old lapi-

dary not long afterwards disposed of his property to a limited company that had been promoted and financed by Nathan

with twenty thousand pounds, married, and settled down as a country gentleman. Vandergaart Kopje is not yet "played

out," and continues to yield at least a fifth of the diamonds annually exported from the Cape. But as yet no digger has had the good luck, or the bad luck, to light upon another Star of the Settlement!

(THE END.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XIV.—(continued.)

IN a few minutes carriage wheels were heard, and a singularly clever-looking gentlemanly man, in a sort of shooting jacket and waistcoat of brown and with grey continuations, entered.

"This is really very kind, Mr. Brandt," said Mr. Hamilton. "It is very good to come at all, but especially good to come so quickly."

"*Bis dat qui cito dat*" ("He gives twice who gives quickly"), answered the lawyer, smiling.

"Quite true. Many thanks for taking

my summons in this way. Allow me to introduce my friend Mr. Tenterton, on whose behalf I seek your aid."

"Well, what has he been up to?" asked the lawyer, whose use of this colloquial phrase had so droll an effect on Tenterton that he could scarcely forbear laughing. However, he kept his countenance, and Mr. Hamilton told the story of the mysterious discovery of papers in his portmanteau. At this Mr. Brandt looked grave, and Mr. Hamilton glanced at Tenterton with a merry twinkle in his eye.

"How do you account for your mysterious possession of these papers? Had any person access to your trunk at Berezovo?"

"Not a soul; but on that memorable evening of the fire I had taken some papers of my own out of the top part of the portmanteau and placed them in a drawer of the writing-table in my room, and when the alarm was given I rushed upstairs to save those papers, which are very important to me. I now remember (and this did not occur to me when re-

lating the circumstances to Mr. Hamilton) that I turned the drawer in which I had flung these papers of mine upside down, so that the whole contents fell into the trunk. The Berozovo manuscripts must have been at the bottom of the drawer and have fallen into the portmanteau with the other things. Of course that *must* have been the way in which those unfortunate papers came into my possession, and I am surprised at my own stupidity in never discovering the accident. That must have been the way of it."

"Was any one with you in the room at the time when you put the papers into the drawer?"

"Oh yes, Paul Abrazoff was there, and he saw me open the drawer and throw my papers into it, but no person saw me fling them into the portmanteau when the alarm of fire was given."

"You see, Mr. Tenterton, it is necessary to be very accurate in every step of such a proceeding as this is likely to be, and a broken link in the chain of evidence might be serious. I don't say that the question as to how you obtained possession of these papers could materially alter their bearing on the case, but a judge might very possibly consider your evidence weakened if it were impossible to show how they could have got into your trunk. They did not go thither of their own accord. As the statement first stood, that was a weak point indeed, but you now start a very likely theory to remove it. At all events, no judge would, I think, consider the whole thing a groundless charge got up to extort money, or to endeavour to substitute a spurious claimant for the right owner now in lawful possession of the Riazan estates. Unless you had hit upon this way of accounting for your finding the papers in your box I should have advised you to keep quiet for the present until something should 'turn up' to bring the whole thing under the notice of the law. Such an accident might occur at any time."

"But now," said Tenterton, "when will you be able to look through these documents?"

"It is a pity that you did not bring them with you, we might have finished the work at once; at least I could have decided on the advisability of proceeding with the matter or not. It seems to me that if you have properly understood the purport of the papers a strong police case is set up, which will lead to a criminal trial, and this ought to be looked into at once. If you please I will call upon you to-morrow at any time between eleven and three, unless you prefer to meet me here and look over these things with Mr. Hamilton, whose knowledge of Russian is excellent. Or if you like to call upon me at any time to-morrow I shall be at home to you."

It was agreed that the lawyer should meet Tenterton again at the chaplain's, and that the latter should bring the documents with him, which might change the aspect so materially of the whole nature of not only the present possessor of Ozoonovo, Berozovo, and all the Riazan estates, but of some person or persons now unknown. The three friends separated for the night, and Tenterton sought the sacred walls of that whitened sepulchre, the Kremlin at Moscow.

Early the next morning a servant brought him a letter to his room request-

ing his attendance between the hours of nine and eleven at the house of Mr. Smirnoff, in the Loubiyanka.

"Ah!" he said. "How all this comes as it were to a focus! I hardly dare to allow my suspicions to live in my own heart for a moment; but when I think of the agitation and rage of Mr. Abrazoff when he heard of the death of the old peasant woman, Olga Ivanovna, I cannot but feel certain that the child confided to that old woman was no other than Ivan Dobroff. What a singular thing that I, who have these convincing proofs that Abrazoff is not the owner of the Riazan estates, and some circumstantial evidence that little Ivan is actually the true heir of all these possessions, should be the very man of all others selected, quite without my own wish or effort, to become his tutor! The ways of Providence are inscrutable!"

During this soliloquy Tenterton had written a short note to Mr. Smirnoff accepting the invitation and promising to call at half-past nine exactly.

Punctually he arrived at the newly-enlightened house, Smirnova, in the Loubiyanka.

A gentlemanly-looking young man was just about to leave.

"Can you tell me where to find Mr. Smirnoff?" said Tenterton, in Russian.

"Yes, through the second glass door on the right. I beg your pardon," he continued, speaking English without a trace of any foreign accent. "Are you Mr. Tenterton?"

"That is my name," answered Edward. "But how could you guess it?"

"Mr. Smirnoff expects you, and he mentioned to me that a young English gentleman would be here at this time"—looking at his watch—"so, if you will permit me, I will at once lead you to him."

"How well these Russians speak English," thought Tenterton. "In London now, who in the world would ever dream of learning Russian?"

"Mr. Tenterton has arrived," said the stranger, opening the glass door. "Will you see him now, or shall I ask him to wait?"

"Pray ask him to be kind enough to step in," said Mr. Smirnoff, jumping up from his chair. "How do you do, Mr. Tenterton?" he continued, in French, to Edward. "It is most kind of you to come over to me so quickly. Pray take a seat. I am much obliged to you," he continued, addressing the young clerk who had shown Tenterton in; "I shall be glad to have that matter settled with Defriess, if you will kindly see to it; when you return I shall be anxious to know what he says about it, and shall be glad to see you at once."

The young man was gone in a twinkling, for, as we have already seen, there was a quiet firmness in Smirnoff's kind tones that generally carried the point he had in view more effectually than any amount of bluster could have done.

"Well, Mr. Tenterton!" he continued, in French. "I hope we shall become very good friends, for the service I am about to ask of you is the greatest piece of friendship that can be shown me. It is to help in giving a healthy tone of mind to one who will one day inherit all the worldly wealth with which it has pleased God to endow me. I want you to give me all the time at your disposal; I know you are much engaged at the

Kremlin, but whatever time you may have to dispose of I should be thankful for."

"You are extremely kind to me," said Edward, "and it is most flattering to me to have so much confidence reposed in me."

"I was recommended to apply to you by the chief of the police, and he ought to know the best man to look after others. He has taken great interest in my poor little orphan, Ivan Dobroff, and is certainly doing his best to show his interest in the boy by this recommendation."

"Will you take it as an impertinent question if I ask you whether this little boy is nearly related to you?"

"Impertinent! Certainly not. On the contrary, I take it as a proof that you know how to set to work, and begin by a very proper inquiry. No, he is no relation at all. I picked him up in a village in the Riazan district, to which I had been directed by a friend who told me a very interesting story of a gentleman of good family, who, being disinherited by his father, sought death under Skobelev, and met it at Plevna. His young wife had died some time before, and their son had been left to the care of rude and illiterate peasants. Well, Mr. Tenterton, my friend told this story so well, and in such pathetic language, that I made a sort of quixotic expedition to the neighbourhood, where I found what I certainly did not expect—namely, a child which years and years ago had been left by its parents in charge of a peasant woman, who died and left the boy to the charge of the priest. From the priest I obtained the child, having promised to educate him to be my heir. I was delighted with this success, which looks like a fairy tale almost. To ensure a proper degree of school training I placed the boy under the care of a student very strongly recommended to me by Professor Videnoff. Unfortunately this student was in some way or other connected with the Nihilistic conspiracy, and instead of doing the boy any good actually did him irreparable harm. In a fit of spite he carried the poor child off to one of the wretched dens of iniquity frequented by the revolutionists, and in consequence he had to pass through the most extraordinary adventures. He will himself explain this passage in his brief career to you. I want you, Mr. Tenterton, to gain his confidence. Be a good friend to him, and teach him what you like, only take care to form his heart and mind upon a pure model, so that he may become a good and honourable man of sound principles."

"I fear you expect too much of me, and will therefore be disappointed. However, I shall certainly do my best."

It was then agreed between Tenterton and Smirnoff that the former was to come every day and spend with Ivan such time as was not taken up by his duties at the Kremlin. Terms were arranged and all preliminaries agreed on. Then Tenterton asked to be allowed to see his new pupil, and Smirnoff, pressing the knob of a silver bell standing on his writing-table, requested his secretary to take his place and receive any business callers, and represent him while he took Mr. Tenterton upstairs to Ivan.

Like most of the dwellings of the wealthy in Moscow, the lodgings occupied by Smirnoff consisted of a number of handsome rooms opening one into

another, so as to form a grand suite when all the doors and curtains between them were flung open. Smirnov led Tenterton into a room at the end of the suite, furnished somewhat in the manner of his "cabinet" at Zakolniki. The writing-desk was similar, while the book-cases and other articles of furniture looked as though they had been brought into Moscow from the datch without any change or alteration whatever. Here he offered Tenterton a seat and a cigar. The former was accepted and the latter declined.

"Well then, we must show you the boy. Yury! Tell Tatiana to bring Ivan Ivanovitch to my room. I want to speak to him."

Yury departed on his mission, but after some time returned, saying that the young gentleman was nowhere to be found, nor could they trace him.

"Lost again?" Mr. Smirnov cried. "The child is certainly bewitched. This cannot be the result of ordinary natural laws. What is the use of wealth to me without heirs and without friends? Never was any man so used by fate!"

His flood of despair seemed so overwhelming that Tenterton felt it best to withdraw. So, excusing himself on the ground of an appointment with the English chaplain, he left.

A little later Mr. Smirnov stepped down to his secretary, and telling him that he was going out and should not return for an hour at least, left the house, and jumping into a hackney drosky drove off to the house of the policeman.

Meanwhile Tenterton hastened to Mr. Hamilton's, calling at the Kremlin for the important and mysterious papers on his way. He found Brandt and the chaplain waiting for him, and so, without any preliminary matter, he began.

"I am very sorry to be so late. Hope I have not kept you waiting. The fact is I have just been at the house of Mr. Smirnov, and if all be as I suspect we are working in vain, for Ivan Dobroff has again disappeared."

This was not so startling to the lawyer as it was to the chaplain, who had heard of Ivan's adventures through Madame Kakaroff and from Tenterton, who was naturally equally full of the subject of our hero. So Brandt merely observed that he "did not see how the absence or presence of the boy could alter the case as far as the conduct of the Abrazoff's was concerned. For," he argued, "whether the real owner be your little Ivan or not is a secondary point, the first and most important consideration being to establish that the Riazan property did not belong to the Abrazoff's. Who the owner might eventually turn out to be was a matter for further consideration."

The practised eye of the lawyer, accustomed from boyhood to decipher Russian documents, soon extracted from the papers before him all the information which they were capable of yielding. The father's will was there, in which the former will was revoked and his eldest son restored to all his privileges. This will bore all the signs of genuineness, being signed, sealed, witnessed, stamped, and delivered, all in order.

The next document was from a certain Captain Orloff, announcing to Mr. Abrazoff that he had placed his nephew as required in the hands of the peasant woman, Olga Ivanovna, at Berozovo, and had represented the child to her as the son of a common soldier who had fallen at Plevna. As he had himself survived the action there a shattered wreck, and was known to have been prominently engaged, that was the easiest and most natural story to tell. The letter concluded with an expression of two strong desires—the one that the sum agreed upon for the boy's keep should be regularly supplied, the other that the acknowledgments of debt held by Mr. Abrazoff should, in consideration of this service, either be cancelled by him in the presence of witnesses or returned to him (Captain Orloff) as soon as possible. A third document was a letter dated two years later, acknowledging the receipt of the bills, notes of hand, and other evi-

dences of debt returned by Abrazoff evidently after much importunity and trouble. A fourth was from a priest living in a little country town near Tula announcing the death of Orloff, and stating his dying wish to have been that the money paid to Olga Ivanovna might be carefully continued; further that the child should be well and carefully trained, and lastly that Abrazoff should cause prayers to be said in the church at Berozovo for the peace of his (Orloff's) soul.

When these remarkable documents had all been read and translated into English, so that no mistake could exist in the mind of Tenterton as to the propriety of the steps he had taken, the chaplain said to Edward,

"Can you believe in accident after this? Can you not see how your journey to Berozovo just in time to rescue these wonderful documents from the fire was a link in a chain of most wonderful exercises of the power of Divine Providence? How marvellously this Ivan Dobroff has been watched over! The evil influence of the Revolutionist or Nihilist was removed in the most extraordinary manner. And now you are to be placed over him to exert the influence which you have received from the Highest Source! Again, how remarkable must it appear to the mere worldling when he finds the wishes of the dying sinner so singularly carried out, though not in the way he meant and intended! He wished Abrazoff to provide handsomely for Ivan, but Ivan has been much better provided for by Mr. Smirnov, under whose care he has in fact a much better future, humanly speaking, than he would have had under the cold distant patronage of Abrazoff, whose interest it would have been to keep him hidden from the rest of the world in some obscure station. The story of this Abrazoff, with all his skill, is a striking example of the Divine Law that 'Unless the Lord build the house, they labour in vain that build it.'"

(To be continued.)

SCHOOL AND THE WORLD.

CHAPTER XL.

THE result of his visit was such that on his reaching home rather late he wrote to Fanshawe and posted his letter before going to bed. It was a very short one, simply stating that Lang refused to make terms of any kind or hold any future communication with him.

Next morning Garland found his way to Mrs. Turner's by nine o'clock and had an interview with Lang before he went to his office. He told him how Fanshawe had threatened to report to Clarke, Clarke, and Cooper the fact that their new pupil left school under a suspicion of theft, and how there was every probability of his carrying out his threat.

"What a fool I was to tell him!" cried Lang. "It slipped out before I knew, and I was so glad of somebody to talk to then. What shall I do now? No one can prove that I didn't do it."

"I'm not sure of that," replied Garland.

"I think it can be managed. I saw Melhuish last night."

"Saw Melhuish?" cried Lang.

"Yes, I've known where he was for some time, but he wouldn't let me tell any one. He's a very different fellow now: he's had a lot of trouble and it has changed him. I told him last night that the time had come to prove whether he really repented of what he had done. I showed him how your career was in danger, because you were suspected of the crime of which he was guilty. I was doubtful of the result of my appeal for some time, but he yielded at last. It shows that he is a good fellow at bottom, for it must require no slight courage to come forward and confess one's self a thief."

Lang's face showed his surprise and satisfaction. Fanshawe's discomfiture was now only a matter of time.

So it was with a comparatively easy mind that he obeyed a summons to Mr. Clarke's room at four that afternoon. Mr. Clarke was a gentleman of about fifty; grave, and rather stern in appearance, but who enjoyed the respect, and to some extent the liking, of his clerks and pupils.

"Mr. Lang," he began, "take a seat. I have received to-day a strange letter about you of which you ought to know. It accuses you of leaving school under a suspicion of theft. I must say a charge of this kind made in this way seems the outcome of spite more than anything else; at the same time I should like to get to the bottom of it. I have answered the letter to the effect that I can take no notice of anonymous accusations, for this is practically anonymous, since the name is unknown to me and may be an assumed one. I told the

writer that if he has any statement to make he must make it in person, and I named five o'clock to-morrow as the hour when I should be at liberty."

"It isn't in anyway true," said Lang, "and I shall be able to prove it."

"I'm very glad to hear it. If your proofs are at hand it would be well to have them ready to-morrow in case he comes."

"I will, sir."

After office was over Lang walked straight to Mr. King's to see Garland. The latter was not surprised to hear that Fanshawe had carried out his threat.

"It's the best thing that could happen to you," said Garland. "It will end his interference with you once for all. It is a good thing in another way too."

"What is that?"

"It will be the salvation of Melhuish. He is eating his heart out now in solitary

bitterness. This will relieve his mind; he will feel he has made some amends for his former wrongdoing, and he will, by God's help, I hope, pull himself out of that slough of despond in which he has been so long. I quite believe that this will end in his making a fresh start and a better one."

* * * *

Next afternoon was an exciting one for Lang. In spite of himself he could not help being agitated. Supposing after all something unforeseen were to happen, and he could not clear himself? Supposing Melhuish at the last minute failed in courage and refused to come!

Usually the office closed at five o'clock. Lang remained behind the others, and a few minutes past the hour he was summoned to Mr. Clarke's room.

"Your accuser has not come," said Mr. Clarke. "We will give him a quarter past. Is that he?"

"No," said Lang, who had caught sight of Garland, Melhuish, and Soady. "They are my friends."

"They had better wait in the next room," said Mr. Clarke.

A few minutes later Fanshawe arrived. He was shown into Mr. Clarke's room. Lang took no notice of him.

He looked seedier than ever. His eyes had dark rings round them, and his complexion was thick and muddy. The atmosphere of hate and revenge in which he had been existing during the past few days had not been without effect on his countenance. Altogether his appearance was not such as to inspire confidence.

"You are the writer of this letter?" asked Mr. Clarke, when he was seated.

"Yes."

"On what do you found your accusation?"

"On what I have heard. It is well

"These are grave accusations," said Mr. Clarke.

known to several people, though the affair was hushed up as much as possible."

"A mere rumour is not sufficient to justify such a charge," said Mr. Clarke.

"He cannot deny it," said Fanshawe. "The stolen money, or at least part of it, was traced to him; it was marked, so there can be no mistake on that point. He was a friend of a boy who ran away the same evening, so that he was able to wait till just before he got off in order that the suspicion might be thrown on the runaway. And he was suspected once before of being a thief, but it couldn't be proved."

"These are grave accusations," said Mr. Clarke; "can you deny what this—this gentleman has said?"

"No," replied Lang. "It is quite true I was suspected of the thefts, but I never committed them."

"You spoke yesterday of being able to prove your innocence," said Mr. Clarke.

"He will find it difficult," said Fanshawe, with a vindictive sneer.

"I think I can manage it," remarked Lang, quietly. "May I ask my friends to come in?"

"Certainly."

Lang opened the door, and Garland, Soady, and Melhuish walked in. Lang went to Melhuish and shook his hand warmly.

Fanshawe started with surprise to see him. He was the last person in the world he expected to meet. However, he pulled himself together, resolved to brave it out.

"You've brought a nice witness to help you," he said, with a laugh. "I suppose you have bribed him to help you out. 'Honour among thieves.'"

"Silence, please!" said Mr. Clarke, sternly. "Who is this, Mr. Lang?"

"May he speak for himself, sir?"

"By all means."

"I was at school with Lang," said Melhuish. "I stole the money of which I learnt last night he was suspected to be the thief. Garland asked me to come and confess, and I am here to do so."

"It is a very noble thing of you to do," said Mr. Clarke, approvingly. "If it is the fact—and I suppose no one would own a crime he had not committed—it clears Mr. Lang most completely from the charges which have been brought against him. Have you anything more to say?" he added, turning to Fanshawe.

"No, if you are determined to be the victim of a conspiracy to blind you. Why, that precious witness of yours has owed me money for the last year and more, and owes me a grudge too, I suppose."

"I owe him two pounds," said Melhuish, without looking at him. "I've got them ready. I should have sent them before if I had been able. My debt was the only link between us, and it is now broken."

He put the money on the table. Fanshawe quickly picked it up.

"I've got something by coming, at any rate," he said; "and as I don't seem likely to get any more, I'll wish you all good afternoon."

"One moment, sir," said Mr. Clarke. But Fanshawe stepped towards the door. However, so did Soady, and Soady got there first.

"Mr. Clarke wishes to speak to you, strange to say," remarked Soady, blocking up the exit with his body. "You'll please wait."

Fanshawe turned sullenly round.

"Surely," said Mr. Clarke, half to himself, "I've seen your face before. I've a good memory for faces; I'm not mistaken." He tapped his forehead meditatively.

"Perhaps we've met at some music-hall," suggested Fanshawe, insolently.

"Ah! I remember now, I think," said Mr. Clarke, his brow clearing. "Have you not been in our office before?"

"I shall take care not to come again, at any rate."

"I'm glad to hear that. When the case of Armstrong versus Armstrong was in court I think you came here once or twice with papers from the firm of Parkes and Green. Am I not right?"

Fanshawe did not reply.

"I will spare myself the trouble of telling you now what I think of your conduct, but I shall take care to see Mr. Parker."

"You can do what you like," retorted Fanshawe; "you can't hurt me. Is there anything more you want to say?"

"No, except that the sooner you are gone the better."

Fanshawe did not wait for a second hint, but walked off. And as he is not a pleasant companion it may be as well to say at once what became of him and so bid him good-bye.

Mr. Clarke saw Mr. Parker as he promised, and Fanshawe in consequence fell still further in their estimation. Not long after matters came to a crisis as regards his finances. He made a desperate attempt to recover himself by betting heavily on some races, but lost instead of winning. He could not pay, so elected to go abroad. The last that was heard of him was that he was a "hand" on a farm in the West, and his English acquaintances (with the exception of his creditors) hope he may remain there.

* * * *

There was a very happy party at Soady's that evening. Melhuish refused to come, but Soady was disinclined to have his invitation declined, so took his arm and marched him off.

The first thing that met their eyes when they entered the sitting-room was Tommy.

"I was wondering when you fellows were going to turn up," he said, coolly. "You've kept me waiting nearly an hour. I can't afford to waste my holidays this way."

Soady tumbled him off the table where he was perched, and made his friends sit down and make themselves comfortable. He was particularly attentive to Melhuish, who was still reserved, and seemed to feel out of place.

"Why, Tommy," said Soady, "you're growing up, I positively believe."

"I'm beginning to know my way about," remarked Tommy. "I haven't got into the third form for nothing."

"Great Caesar!" ejaculated Soady; "what is St. Mary's coming to?"

"Oh, we're getting on like smoke now that you fellows have given up stopping up the way. We beat the town at cricket last week."

"Did you?" cried Lang. "How many did Ferguson make?"

"Ferguson? He left at Christmas."

"Ah, yes, so he did. Who made top score?"

"Featherstone, one innings; but he got out for a duck next time."

"Featherstone in the eleven?" inquired Soady, incredulously. "Why, you'll be telling us you are next."

"I think I shall be next half," said Tommy, complacently. "I've got a deadly twist from the off which would settle you in no time."

They asked after all their old friends and the masters, and had a jolly talk over old times. Then Tommy had to depart.

"I've got to trot my mater and sisters somewhere or other to-night, so I must be off," he said. "Well, good-bye all you fellows, I shall look you up again before I leave town."

"'Twouldn't hurt you to do a little more 'looking up,' you young shaver," said Soady; "you don't treat us with half enough respect."

"I'll begin some day, when you deserve it," was the youngster's retort, as he tossed his hat up and caught it on his head. "Good-bye."

"Now then, you fellows," said Soady, when he had seen Tommy off the premises, "we must have something to eat, and then we'll have an evening of it; you shall hear my new piano."

"I think I'll go, if you don't mind," Soady said Melhuish.

"But I do mind," returned Soady. "Look here, Melhuish, you must forget all about the past; no one knows a word of it except ourselves, and never will."

"You have done all you can in restitution," said Garland, through whom had been sent back all the money which had been taken from Simpson and Ferguson; "you must not allow yourself to brood any more over your past errors. We know you have repented and that you have behaved bravely and nobly, and you must be friends with us again."

"I can't thank you enough," said Lang, "for what you have done for me. But perhaps I can show you something which may help to relieve your mind. Read this."

He handed him the letter which he had received six months before from Mr. Melhuish. Melhuish read it carefully, with tears in his eyes.

"You mustn't think of going back to your work any more," said Garland, to whom Melhuish handed the letter. "You must write off to your father to-night, and to-morrow you must go home."

Melhuish at last assented. He swept the past away, only remembering it as a lesson and a warning. He threw himself into the enjoyments of the evening, and spent the first happy hours since he left St. Mary's to run away to London.

A few weeks later and all our friends were scattered. Garland went to his home to proceed to college at the close of the vacation; and he is now doing good service in the world, both by his unselfish, consistent life, and his earnest preaching of the old, old story of God's redeeming love in Christ Jesus, to all who humbly trust in Him. Melhuish was soon settled in Liverpool, apprenticed to a civil engineer. Lang and Soady were the only ones remaining in London, and these were off for their holidays before long. And now, as they are all fairly started on their life-work and ready to do it as well and bravely as they can, looking up in every temptation for that help that is never truly sought in vain, let us take our leave of them. Perhaps we may one day meet with at least some of them again.

(THE END.)

AN EVENING AT THE SALLOWS.

BY THEODORE WOOD,

Author of "Our Insect Allies," etc.

ONCE more the bright spring-time is here, and once more do we ferret out our insect-hunting paraphernalia in readiness for the coming season of active work. Past is the winter of our discontent, gone is the bleak and chilling cold which has doomed us for so long to forced inaction, and here we are, on this mild and genial March evening, *en route* for a small copse wherein is to be found in rich profusion that treasure-house of entomology, the blossom of the Sallow. Thither, after the shades of night have fallen, will wend every moth in the neighbourhood, and there, so absorbed in the luscious banquet as to be indifferent to our approach, do we confidently hope to find many an addition to our collection, while we have before us the certainty of spending a delightful evening, rendered all the more pleasant by the contrast with the long wintry nights, now happily past, in which outdoor work has been a total impossibility. So here may the belated wayfarer behold us equipped for the expedition, net, lantern, sheet, and bulging pockets alike testifying to an experienced eye the errand upon which we are bent.

Long before arriving at our destination, our eyes are gladdened by many a sign that our labours will not be altogether in vain. A bat is busily hawking to and fro, showing that insects of different kinds are upon the wing, while a swarm of gnats are dancing gaily in the shelter of the bushes which border the path. A few minutes later, when the sun has altogether disappeared, leaving behind but a few streaks of red in the western sky, we meet with a still more sufficient proof that the evening is propitious for our purposes, for a dusky form flits rapidly past us in the twilight, cleverly eludes the net with which we attempt to intercept its progress, and speeds upon its way to the scene of the banquet, whereat we shall probably meet with it upon our first visit.

Ten minutes of steady walking bring us to the scene of our labours, a long row of willow bushes bordering a narrow stream, each one of which is a mass of the canary-coloured fragrant catkins which exercise so potent an influence over the members of the insect world. It is already sufficiently dark to begin operations, so we light the lanterns, prepare a score or so of pill-boxes for immediate occupation, and carefully spread the sheet beneath the branches of the first bush in the row, a matter which the recently ploughed soil renders of some little difficulty. However, it is done at last, and the friend of our heart, who generally accompanies us upon these expeditions, stands by with a lantern, while we ourselves proceed to administer a gentle shaking to the boughs.

And with what a result! The sheet, when we come to examine it, is literally strewn with moths of various sizes, one and all of which are hard at work endeavouring to delude us into the idea that they are lifeless objects, in the hope that they may presently be able to steal away unperceived, when our attention shall have been diverted into other directions. Nor are these the only tenants, for several well-fed caterpillars lie coiled up here and there, apparently actuated by similar ideas, while earwigs without number, a beetle or two, several spiders, and the inevitable centipede, are putting their best feet foremost, evidently feeling that no time should be lost in making their escape. With these latter, however, it is not our intention to deal, for we have our work fully cut out for us in the mere task of identifying the fallen moths before they recover from their alarm and take to flight.

And this is by no means an easy process.

Scarcely a square three inches of the sheet but is occupied by one specimen at least, while in some spots quite a number are closely huddled together, having evidently fallen simultaneously from some specially attractive cluster of blossoms. Nor does the mere number of these form our only difficulty, for at least nine out of every ten are lying upon their backs, so that their real character cannot be discerned until they have been turned over, and the wings thus brought to view. As if to add to our troubles, moreover, a large proportion seem suddenly to realise that their motionless postures afford them but little advantage after all, and decide upon an immediate change of tactics in the form of hasty departure. Happily, however, in so doing they trust to their feet and not to their wings, and so can be easily recognised as they scuttle along, and either pill-boxed or allowed to make their escape unhindered, according to their respective values.

Nevertheless, our task for some little time is by no means a light one, and for several minutes we are kept busily at work examining and pill-boxing, now snapping up a nice variety as he hurries along, and now finding a still greater prize among the common herd. Here is a specimen of the aptly-named Hebrew Character (*Taniocampa gothica*), with the curious black markings upon the fore wings, and here one of the beautiful Red Chestnut (*T. rubricosa*), with its tints of richest brown. There, scudding along with racehorse rapidity, is a magnificent example of the Clouded Drab (*T. instabilis*), perhaps the most variable of all our British *noctua*, while, still lying motionless in the full glare of the lamp, are no less than seven representatives of the closely allied Common Quaker (*T. stabilis*), so called from the sobriety of its garb, which is about as dingy in colouring as can well be imagined. That little drab-coloured fellow, with its fore wings thinly sprinkled with black, is a Small Quaker (*T. cruda*), a species which does not appear to be very plentiful in some parts of the country, while resting beside him is a specimen of the common Chestnut Moth (*Cerastis vaccinii*), which, having passed safely through the frosts of winter, seems to have come hither with the intention of making amends for his long fast without further waste of time. Sadly battered is he as to the wings, which afford very evident signs of the buffets he has received in his passage through life, while the round bald patch on his thorax shows that he has received decidedly rough treatment at some period of his career.

More *gothica*, more *stabilis*, and more *vaccinii*, which are present in abundance, while a more aristocratic insect turns up every now and then to vary the monotony of the proceedings. At length, after ten minutes or so of hard and steady labour, our task is for the present completed, the last remaining moth has been inspected, and we proceed to transfer the sheet to the next bush.

In so doing we meet with our customary mishap—i.e., that of plunging well over the ankles into the muddy border of the stream, and so dooming ourselves to wet feet for the remainder of the evening. It is a most singular and inexplicable fact, but we seldom set out upon an entomological excursion without walking into a ditch, or a stream, or a peculiarly deep and well-filled gutter, before the day is ended. So regularly is this the case, indeed, that our companion has come to look upon it as quite a matter of course, and would probably be greatly surprised if we were to reach home without experiencing some such misfortune. Upon the present occasion he scarcely looks round, and, beyond

a sarcastic "As usual," takes no notice whatever of our little accident, continuing without interruption his task of arranging the sheet.

Again the bush is shaken, and again descends the heterogeneous shower of earwigs, spiders, beetles, caterpillars, and moths, among the latter being one or two miserable-looking specimens of the Satellite (*Scopelosoma satellitia*), which, like the Chestnuts afore-mentioned, have passed through the winter in a state of hibernation, or torpor. These we do not want, and pass them by in favour of a really magnificent specimen of that most lovely moth, the Pine Beauty (*Trachea piniperda*), which has evidently been attracted by the fragrant catkins from a neighbouring fir plantation. Few of our British moths are there more exquisite than this little creature, which cannot but win admiration whenever it is met with, so beautiful are its tints, and so perfect the manner in which they blend with one another. Judging by the condition of its plumage, our latest captive must have essayed its powers of flight for the first time in seeking the feast at which it was thus rudely disturbed, and we are not a little pleased at securing so fine an example of the moth in a manner so entirely unexpected.

Single misfortunes never come alone, as the Irishman said, and the same rule seems in this case to apply to pieces of good luck as well, for, lying almost beside our Pine Beauty, we find a singularly perfect specimen of the Lead-coloured Drab (*Taniocampa populeti*), which at first sight might easily be passed over as *T. instabilis*, so great is the likeness between the two species. Here we have indeed a prize, for *populeti* is not at all a common insect, and is one with which we by no means expected to meet to-night, excepting perhaps as a very doubtful possibility.

One or two more *rubricosa*, which is a particular favourite of ours, are lying motionless in the sheet, and we also box several nicely-marked *instabilis* before arriving at the end of our examination. Then there is a very fine specimen of the Twin-spotted Quaker (*Taniocampa munda*), with the two spots near the hind margin of the fore wings from which it takes its name, a dreadfully battered Sword-Grass (*Calocampa exoleta*), and a whole host of commoner things, for which we cannot find room in our boxes, and which, indeed, would scarcely be worth the trouble of setting.

The next bush, which is a much lower one, we examine in a different manner, the sheet being spread upon the ground as before (reinforced for greater security by a great-coat upon either side), but our attention being divided between the insects which fall to the ground and those resting upon the blossoms, the ceremony of shaking the boughs being upon this occasion only dispensed with. The fallen insects are committed to the especial care of our companion, who, lantern in hand, at once sets busily to work, while we ourselves examine the catkins in the hope of finding one or two of the early spring Geometers, or perhaps some of those which pass through the winter in a torpid condition. Nor are we disappointed, for our search is ere long rewarded by no less than three examples of the pretty Autumn Green Carpet (*Cidaria miata*), which, although somewhat knocked about and worn, are yet welcome additions to our list of captures. Daintily resting upon one of the blossoms, too, is a specimen of the Dotted Border (*Hibernia progemma*), which, in spite of its great abundance and its dingy appearance, we have long regarded with special affection, looking upon it as a

harbinger of spring, and consequently of a speedy return to outdoor work.

Although these geometers stick to their posts in the most praiseworthy manner when the lantern light is turned upon them, being far too deeply absorbed in their feast to heed so trifling an interruption, the *noctuae*, curiously enough, almost invariably fall to the ground, and are duly intercepted by the sheet spread below for their reception. Fortunate is it for the entomologist that these gentry have not sufficient common sense to take at once to flight, for but small chance would he have of capturing them were they to trust to their wings instead of to their power of simulating death when alarmed by the light of his lantern.

Passing on to the next bush, we again find that the blossoms are quite out of reach, and are consequently obliged to have recourse to the shaking process as before. Down come the moths in a perfect shower, like dead leaves in an autumn gale, dropping heavily to the ground, and lying as motionless as though they were in reality the lifeless objects which they wish to appear. Can moths bruise themselves, we wonder? and, if so, must they not severely feel the shock of so heavy a fall? To all appearance, however, they are perfectly unharmed, although the distance which they drop is about the same in proportion to their size as would be a tumble from the top of a building four times the height of the Monument to ourselves!

Time passes rapidly, and we find that the attendance at the blossoms is beginning to slacken off after about two hours or so of steady work, to again increase, in all probability, later on in the evening. However, what with moths and what with caterpillars, we have already filled almost the whole of our boxes, and, with the prospect of a long walk home before us, we feel that we ought not further to delay our departure. So the sheet is reluctantly folded, great-coats roughly brushed and once more donned, pill-boxes carefully packed away in the pockets, and our evening at the willows is a thing of the past.

(THE END.)

OUR MILITARY BANDS.

By J. ARTHUR ELLIOTT,

Author of "The British Grenadiers," "England's Drummer Boys," "Kavanagh of Lucknow," etc., etc.

THE "pomp and circumstance of glorious war," as England's greatest poet has phrased it, is for the most part due to the silvery-toned trumpet, the clashing cymbals, and the rattling drum, without which even the flying colours and the booming guns would appear somewhat tame and spiritless.

Shortly after the Franco-German War had come to a close, and our light-hearted neighbours across the Channel were giving all their attention to the subject of retrenchment, especially in their military estimates, some zealous reformer proposed that the regimental bands should be abolished. This proposal was not adopted in its entirety, but for several years the use of the drum was discontinued, until, amid great popular acclamation, it was once more restored in the summer of 1882. The French regiments have no drum-and-fife bands like our English battalions, but simply

buglers and drummers, and as the bugles cannot be played for a long time at a stretch, the soldiers often have to march to the rattle of the drum alone.

Military life would indeed be shorn of one of its chief attributes were the soldier compelled to march to battle without the inspiring tones of the cornet and trombone, the "wry-necked fife," and the tinkling cymbal. From the earliest period music has occupied a prominent place in times of war as well as in times of peace, though it is not always used as a direct incentive to battle, for the strains of a band are seldom heard in the field, and the wild pibroch of the bagpipe, or the martial cadence of the bugle and trumpet, can scarcely be classed under the term "music."

It is only on the march, or in camp or barrack, that the band is brought into general requisition, but there have been notable and historic exceptions to this rule, as, for in-

stance, in the meeting between Wellington and Blücher at the village of La Belle Alliance on the field of Waterloo, when, during the famous interview, a Prussian band played the National Anthem, "God Save the King," as if the performers were entirely oblivious of the terrible scenes of "grim-visaged war" that were passing around them. And yet another instance, during the Crimean War, when the allied armies crossed the Alma and advanced against the Russian position with bands playing and colours flying. Then again, when Lord Clyde (Sir Colin Campbell) led his brave troops to the relief of Lucknow, and the Highlanders, after amply revenging the massacre of Cawnpore, marched into the Residency over the bodies of the mutineers to the heart-stirring national air of "The Campbells are Coming."

The band is a necessary appendage to a regiment, for without some such enlivenment the life of a soldier would become almost intolerable. When marching to the strains of the band, his mind is freed, for the nonce, of all those petty troubles and annoyances that seem to be inseparable from military discipline in a regular army, and which are the bane of a soldier's existence. It is also necessary that the band should be a good one, and of late years the bands of our British regiments have considerably improved both in the quality of the music discoursed and the abilities of the performers. Doubtless this is in a great measure due to the establishment of that excellent institution, the School of Music at Kneller Hall, where not only are men trained for bandmasters, but boys are also supplied with a thorough musical training, fitting them for a place in the band of any corps in which they may elect to serve. This institution has proved a great success, for previous to its inauguration foreigners used to be employed as bandmasters in many of our regiments.

Down to the year 1851 music was in this country a comparatively neglected art, and this indifference, as a matter of course, greatly affected our military bands, as, with one brilliant exception, to which we shall presently allude, we possessed none that could favourably compare with the regimental bands of the Continental armies. In that year, however, the band of the French Guides crossed the Channel, and the excellent performances of these fine musicians caused quite a *furor* in English military circles; but, unfortunately, our officers allowed their enthusiasm to take an unpatriotic turn, and, instead of encouraging native talent, the rage for foreign bandmasters increased, and to these persons was given the control of our bands, in the same manner that at one time foreign *artistes* were all the fashion.

Perhaps the most martial of our bands

are those which belong to the regiments of Household Cavalry, for their music, combined with the mellow tones of the kettle-drum, has a peculiar cadence that is pre-eminent inspiring.

Various and interesting are the duties which military bands are called upon to perform in camp or barracks, as, unlike the case of the foot regiments of the Guards, the drums and fifes are not very much utilised in the line battalions of our valiant little army. In many of the latter the brass band plays the "Réveille" (from the French verb *réveiller*, to awaken), at sunrise; "Retreat" at sunset; and "Tattoo" or "Taptoo" at the evening roll-call; while the drums and fifes are only called into requisition on the march.

The effect produced in a camp by the bands of the different regiments playing the "Réveille" at sunrise, and the "Retreat" at sunset, is extremely pretty, and is enhanced by their appearance as they march up and down in front of the white tents dressed in their various uniforms. In Highland corps the pipers perform this duty. Every regiment possesses a "parade march" of its own, and some of the tunes are of a most peculiar character. When and why they were chosen as such remains in the majority of instances a profound mystery. The "British Grenadiers" of the Guards, "The Campbells are Coming" or the "Johnnie Cope" of the Highlanders, the "Garry Owen" of the Irish, and the "Ap Shenkin" of the Welsh corps, are intelligibly appropriate; but the "I'm Ninety-five" of the Rifles (perhaps because the Rifles were the old 95th of the line), the "Bronze Horse" of the 55th, the "Miranola March of the Coldstreams, and others of an equally peculiar character, are mainly unintelligible except on the score of "custom."

Many of the other parade tunes, which are common to every corps throughout the army, such as the "Church Call," the "Point of War," and "The General," are the cherished relics of bygone times, and their plaintive cadences seem to transport the attentive listener to scenes and periods which stand as landmarks in history. The meaning of the first-named tune is indicated by its name, and is always played at church parades in lieu of the "long roll" of the "orderly" drum when the newly-formed companies are "dressing" into line. The "Point of War" is the salute which is played by the drums and fifes when a corps "presents arms" to its colours. "The General" is a tune which is played an hour before leaving camp or quarters for a new destination. It is a very old and plaintive though pretty melody, having a peculiar beat to it on the drum. In former days the tune possessed words which were sung by the soldiers as a kind of refrain, beginning thus:

Our Military Bands.
(See the Coloured Plate.)

I. Mounted Band, Royal Artillery.	VI. Rifle Brigade.	X. Life Guards.	XV. Drum-Major, Connaught Rangers.
II. Queen's Bays.	VII. Fusilier Regiment.	XI. 17th Lancers.	XVI. Piper, Seaforth Highlanders.
III. Devonshire Regiment.	VIII. Dismounted Band, Royal Artillery.	XII. 3rd Dragoon Guards.	XVII. Black Watch.
IV. Royal Engineers.	IX. 21st Hussars.	XIII. Scots Guards.	XVIII. Coldstream Guards.
V. 16th Lancers.		XIV. Grenadier Guards.	

"We thought we heard the general say
Strike your tents and march away;
Strike, and march at break of day,—
Quick march, away."

The British army is very proud of its customs and traditions, and there is nothing which attaches to it but has a story or meaning of its own. There are now many excellent bands attached to our line regiments, both horse and foot, while the Royal Artillery, Royal Engineers, and Royal Marines each possessed a fine corps of musicians. When the Prince of Wales went to India a portion of the band of the Royal Marines accompanied him in the *Serapis*, and so pleased was the Prince with their performance that on his return the band was granted permission to wear his badge and motto in silver, on their caps for the future.

The best of the cavalry bands are those of the Life Guards and Horse Guards (Blue), the members of which hold rank at Court as "State Trumpeters," or "Trumpeters in Ordinary to the Queen," for which they receive an allowance annually, while their state uniforms, like those of the drum-majors of the Foot Guards, who are "Drummers in Ordinary to the Queen," are very gorgeous; each suit, which is made of crimson silk and velvet thickly embroidered with gold, costing the country every seven years the sum of forty-five pounds.

In addition to the corps already named our army possesses now three of the finest military bands in the world. They are those of the Grenadier, Coldstream, and Scots Guards. These famous bands never go abroad with their regiments, and the latter are obliged to content themselves when on active service with the humbler, though perhaps more inspiring music (on the march) of the fife and drums. The reason of this is that there is only one band to each of the three regiments, and as they each possess more than one battalion the bands remain behind to do duty with the home battalions, and to attend on the sovereign, both at the palace and at all State parades and ceremonies.

These excellent bands have become quite an institution in the country, for there is scarcely an entertainment of any note given in any portion of the kingdom at which one of them is not present. Their popularity is deservedly great, for their skilful rendering of all the best music is absolutely perfect. To one family of musicians alone—the Godfreys—is due the high standard of excellence which these celebrated corps of military *artistes* have attained. The late Mr. Charles Godfrey of the Coldstream Guards served in that regiment for fifty years, during the greater portion of which he was its bandmaster. He not only brought his band to a high state of perfection at a time when military bands stood at a very low standard, but he educated his family in such a manner that he lived to see two of his sons become bandmasters in the other two regiments of the Guards, while a third succeeded to his own position on his death in 1863.

There is only a single instance of either of these bands going abroad. A few years since,

when the Americans celebrated the centenary of their national existence, they had a monster concert organised, at which a band from every country in the world was to be present; and having applied to our Government to allow the band of the Grenadier Guards in their full dress to represent this country, a special Act of Parliament was passed for the purpose, and the band, of which Mr. Dan Godfrey is the chief, under the charge of a colonel, accordingly went to America. We need hardly say that they were most cordially and enthusiastically welcomed by our cousins over the water.

We must conclude our paper now, although there are many matters of interest in connection with this subject which, had we space enough to spare, would, we feel certain, be acceptable to our readers. As we began with a quotation from Shakespeare, we will also here finish with one:

"The man that hath no music in himself,
Nor is not moved with concord of sweet sounds,
Is fit for treasons, stratagems, and spoils."

OUR OPEN COLUMN.

A PITCAIRN ISLANDER.

Captain Edward Stubbs, R.N., writes to us: "As you lately gave an account of the celebrated mutiny of the crew of H.M.S. *Bounty*, and of the descendants of the mutineers, the following particulars will, I am sure, be interesting to many of your readers. In 1881 I was surprised by a visit from a man who came to ask for advice as to the best method of getting to his island home in the Pacific. His name was, he informed me, James McCoy, and he was a grandson of McCoy of the *Bounty*. He was a finely-made, handsome man, very intelligent, and with simple but most attractive manners. Outward-bound ships to San Francisco do not go near Pitcairn Island; but homeward-bound vessels occasionally sight it, in order to test their chronometers; they, however, rarely anchor, the anchorage being very bad. Captain Mills, who commanded a fine American ship named the *Harvey Mills*, kindly allowed McCoy to ship; and, in response to an appeal which the editors of the local papers inserted, presents of clothes, books, and other useful articles were sent to my office. I heard indirectly that McCoy had reached Pitcairn Island in safety, and last week I received the following letter from him:—

"Pitcairn Island, August 13th, 1884.
"CAPTAIN STUBBS,—Dear Sir,—Captain McKenzie, of Liverpool ship *Majestic*, is here, bound to your port, and kindly promises to deliver this to you.
"It was nearly three years since I was with you, and I hope and trust that God, in His infinite mercy and goodness, is still keeping you in the same health that you were enjoying when I was there, and may God Almighty bless and prosper your work and labour of love. [The Liverpool Seamen's Orphan Institution is here alluded to.] I am so very, very glad to meet your friend Captain McKenzie; he treated us with greatest kindness, and has given us many useful articles to take on shore with us. I gained much information from the kind captain, and am sorry to part with him so soon, but as the ship is very far off from the island I shall have to leave for the shore.
"The captain will see you in Liverpool and give further information. Please give my best wishes and respect to the young gentleman with you and all at the Orphanage. May we all live so as to please God, and then we shall meet again to part no more, every man to receive a crown of glory that fadeth not away. This is the earnest prayer of your ever affectionate friend and well-wisher,
JAMES R. MCCOY."

To Chess Correspondents.

H. M. (Bath.)—You will now have seen, on page 110, that Problem No. 80 does not require *three* moves.

"INITIUS."—After 1, Q—R 8 (ch.), P—B 3; 2, Q x B, in Problem No. 90, Black plays B—Q 2, and mate cannot follow.

H. K. (St. John's Wood.)—If in No. 80 you play 1, R—R 4 (ch.), then you must not interpose the Kt, but answer K x R.

R. W.—The most difficult question to decide when the "Chess Guide" was written was "whether a player might have both his B's on squares of the same colour." It was thought best to leave the law in its simple form (page 20). The Pawn, on reaching the eighth square, is eligible for promotion should any of the officers not be present on the board, and it may so happen that the Pawn is exchanged for a Bishop on a square the same colour as the other B.

S. G. (Wien.)—Freundlichen Dank für die sechs Aufgaben.

OUR NOTE BOOK.

THE "BOY'S OWN PAPER" LIFEBOAT No. 1.

We take the following report from the local papers of Feb. 21st:—"The Looe Branch of the Royal National Lifeboat Association held its annual meeting at the boat-house on Tuesday, Dr. G. Kerswell presiding. The report of the hon. sec. (Mr. R. Thomas) was exceedingly satisfactory. The subscriptions for the past year had amounted to a goodly sum, so that this branch was more than self-supporting, for, after paying all expenses for the year, £20 was voted as a contribution to the parent society. Votes of thanks were accorded the chairman, hon. sec., and local committee, who were re-elected, and also Dr. Bedford Kerswell, of St. Germans, and Mr. C. W. Polkinghorne, of Liskeard, for their kind co-operation in their respective districts. At the conclusion of the meeting a thorough and careful inspection of the lifeboat, gear, and apparatus was made, and everything was found ready for service and in good working order. The lifeboat at Looe is the 'No. 1 Boy's Own,' being subscribed for and presented by the numerous readers of the 'BOY'S OWN PAPER.' The coxswain and crew speak in the highest terms of the capabilities of their boat and feel the greatest confidence in her safety."

BOYS AGAIN.

It is related of the late well-known Judge Black that in 1857, just after he was appointed Attorney-General of the United States, he was staying at the Astor House in New York. Scores of leading politicians called upon him. One day a small grey-haired man arrived at

the hotel, and registered himself as Judge J. Williams, Iowa. On seeing the name of Judge Black on the book he took a card and wrote:

"The Supreme Judge of Iowa presents his compliments to the Attorney-General of the United States."

He sent this up to Judge Black's room, together with a half-sheet of paper, on which he had written:

"O Jerry, dear Jerry, I've found you at last!
 And memory, burdened with scenes of the past,
 Returns to old Somerset's mountains of snow,
 When you were but Jerry and I was but Joe."

In less than three minutes the great dignified Judge Black was coming down the stairs two steps at a time, with a little bell-boy in close pursuit. Two old schoolmates and law students were together after a separation of some thirty years. Two old men embraced each other, and neither was able to utter a word.

"ROBINSON CRUSOE" IN LATIN.

Professor F. W. Newman, Emeritus Professor of Latin in University College, London, has just issued through Trübner and Co. our old friend "Robinson Crusoe" in a Latin garb, the Latin "developed" according to the author's views to suit the expression of modern ideas. Here are the opening lines of the original and the translation:—

I was born in the year 1632, in the city of York, of a good family, though not of that country, my father being a foreigner of Bremen named Kreutznaer, who settled first at Hull. He got a good estate by merchandise, and, leaving off his trade, lived afterwards at York, from whence he had married my mother, whose relations were named Robinson—a very good family in that country, and after whom I was so called—that is to say, Robinson Kreutznaer; but, by the usual corruption of words in England, we are now called, as we call ourselves and write our name, Crusoe; and so my companions always called me.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

1.—Writing Competition.

It will be seen by reference to page 15 of the present volume that we wrote as follows:—

"As really good legible handwriting is becoming increasingly appreciated, especially in commercial life, our first competition shall test the skill of our readers in this direction. We offer therefore, *Three Prizes, of One Guinea each*, for the best copy, in plain handwriting, of the 1st Psalm, from the Authorised Version. Competitors will be divided into three classes—the Junior Division, embracing all ages up to 14; the Middle Division, all ages from 14 to 18; and the Senior, all ages from 18 to 24." Then followed the Rules and General Conditions.

We are happy to be able to report that some ten thousand of our readers have joined in this competition, and the work of examination has been no light task. We this week publish the first list of those who have won places, and hope now to continue the results of the adjudication week by week, reserving our general remarks on the competition until the whole of the successful names have been given.

At present it seems only needful to mention that we found it best, when adjudicating, to slightly readjust the classes, so as to give the younger competitors a fair chance. We have thus formed several additional subdivisions, with Half Guinea Prizes, reserving the Guinea Prize for the winner in the division securing the highest place.

Our Award is as follows:—

JUNIOR SUBDIVISION (all ages up to 12).

Special Prize—10s. 6d.

BERNARD FAIRBROTHER RAMSEY (aged 11), Fern Mount, Suffolk Road, Bournemouth.

Certificates of Merit.

HAROLD MCKAY, Rumbold's Whyke, Chichester.

A. H. MAGUIRE, Royal Academical Institution, Belfast.

EDWIN J. GREENE, 3, Charlwood Place, Pimlico.

HERBERT PLUMPTON, 13, Baldwin's Crescent, Flodden Road, Camberwell, S.E.

HERBERT B. BUTTON, Post Office, Ryburgh, Fakenham, Norfolk.

ARTHUR W. DAYS, Astwood Bank, near Redditch.

HENRY HESSE, 12, Waterloo Terrace, Islington.

FRANK M. MORRIS, 6, Beaufort Buildings, Gloucester.

EDWIN LEE, 92, Blackfriars Road, S.E.

FREDK. FENNER, care of Mr. Jemmett, High School, Worthing.

MAURICE C. CHUBB, Bark Hill, Whitechurch.

D. CRAIGIE, 132, Prince Albert Buildings, Edinburgh.

S. C. HILL, 215, Hawkin's Lane, Burton-on-Trent.

ROLAND S. WOODLIFFE, 29, Brooklands Terrace, Swansea.

ALLICK MACROBERT, Castlehead, Paisley.

EDWIN JAMES CHESHER, The Rowans, Grange Road, Sutton, Surrey.

ADAM W. PARLANE, Glenroad House, Castlehead, Paisley.

CYPRIAN RICHARDS, Paul Newlyn Board School.

WM. GEO. HUTCHISON, Rose Street, Kirkcaldy.

FRED ROBERTS, Roby House, Llandudno.

CHAS. H. GIMBERT, Sutton National Schools, Isle of Ely.

EDWARD PURSER, Sutton National Schools, Isle of Ely.

WM. B. BROWN, Auchinheath, Anerley, S.E.

ROBT. C. COULSON, Cow Lane, Hessle, near Hull.

ARCHIE E. WEBB, Waterford Villa, Chippenham.

PERCY JOHN STRACHAN, 76, Paulet Road, Camberwell, S.E.

BENJAMIN H. STRACHAN, 76, Paulet Road, Camberwell, S.E.

GEORGE SNEESTON, Hessle, near Hull.

HARRY GEORGE SADLER, 55, Gayton Road, Hampstead.

HENRY J. LAKE, Marine Villa, Milford Haven, Pembrokeshire.

WALTER J. HELMSING, Holly Lodge, Hornsea, near Hull.

W. KENNEDY SMILEY, 24, Poplar Road, Oxtou, Birkenhead.

ALAN P. N. STEWART, Green Hall, Belper, Derbyshire.

WM. C. JONES, 2, Monmouth Place, Upper Bristol Road, Bath.

W. M. ANDERSON, Groote River, Knysna.

F. W. T. MEISTER, 17, Sefton Drive, Liverpool.

WM. BUDGEN, Holmfels, Bell Street, Reigate, Surrey.

ALFRED MARSH, Ramsdale, Belvedere Road, Upper Norwood.

J. C. HEATHCOTE, care of Mr. Houghton, 64, Traverse Street, St. Helens.

FRANK NEWMAN, 195, St. Leonards Road, Poplar, E.

CHAS. E. HEDGER, care of Mr. Jemmett, High School, Worthing.

WM. WHITE, 1, Oriel Villas, Mayfield Park, Fishponds, Bristol.

CHAS. R. BUTCHER, Deal House, Gladstone Road, Watford, Herts.

ARTHUR JOLLYMAN, 5, Tyne Road, Bishopston, Bristol.

SYDNEY F. WARNER, 29, Vernon Terrace, Northampton.

GEORGE GREEN, 61, Romford Road, Stratford, E.

ARTHUR IVAN GREAVES, Stafford House, Boston Spa, Yorkshire.

PETER JACKA, Paul Newlyn Board School.

HERBERT G. THOMPSON, Viewforth Cottage, Leven, Fife.

EDGAR GRIFFITHS, Ellesmere Park, Eccles, near Manchester.

WM. C. GORDON, Juniper Bank, Thurso, Caithness.

HAROLD ARNOLD KELL, Uford Board School, near Woodbridge.

GEORGE HUTCHESON, 5, Chichester Place, Brighton.

R. A. WEAVER, 227, Bristol Road, Birmingham.

ALBERT E. HALLIDAY, 4, Northampton Terrace, Harrow.

DAVID J. ANDERSON, Groote River, Knysna.

GEORGE J. MERRALL, Ulverley, Aeock's Green, Birmingham.

WM. A. MARCHANT, 91, White Ladies Road, Clifton, Bristol.

DOINGS FOR APRIL.

THE POULTRY RUN.—Last month was a busy one, but so must this be too, for the cry is still they come—both eggs and chickens. More fowls will be wanting to sit, and to a reasonable extent we should accommodate them. Just at this season of the year few breeders think of incubators. Yet these are very handy instruments to have. There are now some good cheap ones in the market, and before the season is over we may take the opportunity of calling the attention of our readers to these wonderful machines.

Continue then, now to sit hens, choosing a quiet, comfortable place for them. A loft would do; a cellar is better; an outhouse is the worst place of all. Than Dorkings or half-bred Dorkings we can hardly find better mothers; but any large breed that is willing to sit will do excellently well—the Brahma, for instance, the Silky or Cochins. We don't care for the latter very much. The Silky is a fowl of old acquaintance; they are blue in legs, their body covered with silky hair instead of feathers, which is their peculiarity; they have double combs, which, like the face, are a dark purplish colour. Once seen, they are not easily forgotten. Their fault is that they want to sit too much, but they make the very best and most attentive of mothers.

In this month of April, and in the next, although the time may be considered late enough by some, eggs are more likely to be hatched. You will have fewer added ones. We would try our best to dissuade any boy from buying a breeding-hen through the medium of an advertisement. If in the country you are sure to get one easily enough, and there will not then be any risk of her being put off sitting, which effect a long journey sometimes produces.

Put a few added or china eggs underneath the fowl at first, to make sure she really means to sit. When you are convinced of this, then gently place the eggs—thirteen to fifteen, according to the size of them and of the fowl—under her.

It is a good plan to sit two fowls at the same time. We always do. For then if the chickens be not very numerous one fowl will be able to take sole charge, and her companion can go back to the run. Those that go in for a large breeding establishment have what are called sitting-houses. In these each fowl has a nest-box to herself, with a lid to it. But we do not advise any one, boy or otherwise, to go in for breeding large numbers of fowls in this country.

"These are French eggs," we said to our grocer one day, "and only fit to fry." "True, sir," he replied; "but why should not a French egg be as good as an English?"

Well, boys, so it would be if fresh; but exporters buy up eggs from a large number of small householders, and before they can get a quantity sufficient to send from France most of them are stale. We take a great interest in fowl-breeding, and have considered the matter and studied it for years, coming at last to the conclusion that only on a small scale can fowls in England be bred with profit. Hence it is so capital a hobby for boys.

Be careful to feed well now, but let nothing be wasted; this is one of the secrets of success. See that each bird gets a share, and do not permit the big grown chickens to mix with and bully the smaller; if you have any convenience for keeping them apart, by all means do so.

We promised to say a word or two this month about the treatment of ducklings. Well, the great secret of success is getting them to grow well till about two or three months' old, and then fattening them off. By all means, then, let them have all the exercise and range they can. Do not keep ducks unless you have plenty of run; they collect so much food among the grass that they grow very fast, especially if they have access to the water. But young ducks must have a

dry place, and even the pans they drink from should be so arranged that they cannot get into them, else cramps will follow. Give your young ones boiled rice and boiled grains, and, if you can afford it, boiled egg mixed up with it. When a little older boiled lights and Spratt's food, which latter is really cheap when we consider how much good it works.

THE PIGEON LOFT.—Your pigeons will now be paired and hatching. Well, you must know that these birds feed their young on the contents of their stomachs, both cock and hen doing duty in this way; and that there is a kind of secretion from the parents' stomachs which fanciers call pigeon's milk. At all events, the food that the old birds eat is reduced in their stomachs to a soft or pulpy condition. We should bear this in mind now when feeding, and give the pigeons softer food—rice, dari, good grey peas, wheat, and some maize.

If any young ones be very tender you may feed on chewed biscuit and milk from the mouth. You may rear thus, but we are bound to say the trouble is very great. Read our last month's DOINGS, and act thereon in everything connected with the comfort and cleanliness of the loft.

THE AVIARY.—A canary sits thirteen days steadily from the time the last egg was laid. Our plan is to take away the eggs as they are laid, and put them in cotton wool in a locked drawer until the complement, or at least three, are laid, and then put them back. Some do not do this.

Well, in this country there are all kinds of nest-boxes, and the greater proportion of these want a supply of nesting-material. It is a pretty sight to witness the birds building, but for our own part we prefer ready-made nests. However, a little dry moss and other stuff does no harm; it keeps the birds amused. See, however, that it is clean.

You must now change your feeding; and, in addition to the ordinary canary seeds—black and white—give a daily supply of hard-boiled grated egg and bread-crumbs. This must be made fresh every second day, and a new supply given every morning. See that the eggs themselves are good ones. Keep your breeding-cages in a well-ventilated, tidy room, where there is neither dust nor steam, and where quiet prevails. Look out for egg-bound. But it is mostly a weakly hen that suffers from this. So be careful, when mating, to see that your pairs are young and strong.

We do not say much about the different varieties of canaries, because we recommend boys only to breed at first from the commoner, harder kinds, and afterwards to carefully study the breeds.

THE RABBITRY.—We hope that you have good waterproof, big roomy hutches, and that they have a southern exposure, protected from the chill winds of the north and east by a wall, that you have reduced your feeding to a regular system, that you permit your bunnies to have exercise, and that you do not withhold from them a supply of clean water, under the mistaken notion that rabbits never touch it, and that you are rewarded for all your trouble by seeing your rabbits wholesome, lively, clean in the coat, and bright and full in eye. If they are not so they are not thriving, and ten to one the fault lies at your own door. Doctoring rabbits is sadly thankless work, so remember the much-quoted proverb, "Prevention is better than cure." Be careful how you handle rabbits, and especially look after the young. Do not let any one go near your hutches without your permission.

To those boys who live away in wild moorland districts we beg to tender this hint: By keeping half-wild rabbits in a semi-wild state you can make a deal of pocket-money. But your first work would be to make your warren. Fence off half an acre of half-barren ground, and when you have made all secure begin and stock it. More of this next month.

THE KENNEL.—We would not like to advise boys to breed dogs entirely for profit, but we must tell them that from highly-bred dogs of prize pedigree much money is to be made. The mother must be good, and the father a champion. The mother might belong to yourself, the father would be some grand bench-show dog. The address of an owner of such an animal could only be obtained by procuring a catalogue of a recent show from some secretary.

DOMESTIC PETS.—Just a word about poor ill-used pussy, whom we have now taken up cuds for. Pussy will have kittens at times. Well, never keep more than two, and do all you can to find good homes for these. Take the ones you want to destroy away out of the mother's sight, and sink them in a pail of water that has had the chill taken off. It should by no means be hot. Highbred Persian kittens fetch from 10s. to £22s. in the market, so it pays to breed cats.

THE KITCHEN GARDEN.—The weather will now be mild and genial, and the ground dries rapidly under an hour or two of sunshine. Finish seed-sowing in general. Begin to weed the seedlings that are peeping through the ground. Choose a damp day for weeding. Sow kidney-beans, sea-kale, lettuces, carrots, etc. Keep the hoe at work.

THE FLOWER GARDEN.—All your spring flowers will now be in bloom; and on warm sunny days, towards the end of the month, your garden should be very beautiful. Beware of weeds. Keep the ground well stirred, and the walks clean, and borders trim.

THE WINDOW GARDEN.—Though it is not yet time to plant geraniums and other summer bloomers, still, what with forget-me-nots, crimson silenes, arniculas, primulas, scillas, etc., you can have a fine show now. Do not hesitate to transplant a flower even in bloom, but give it earth and do the work quickly. Water every morning or evening. Plant your canary creepers now.

Correspondence.

A TEASE.—1. The colours that are transparent will do, but the opaque ones will not. Rub the paints down in varnish instead of water. 2. Try ox-gall.

F. X.—The letters on tombstones are either lead or an equal mixture of Trinidad asphaltum and oil of turpentine poured in when melted.

UNCLE ARTHUR is informed by **CHANNER** that the reason apple-trees in Somersetshire are sung to on January 17 is probably because that is old Twelfth Day. If there is any particular ceremony observed will Uncle Arthur please describe it or communicate with Channer, 9, Keith Grove, Uxbridge Road, W.?

H. W.—Messrs. Trübner and Co., of Ludgate Hill, are the publishers of Mr. Hasluck's books on Lathework, etc.

RUSTICITY.—There are several agents in London who advertise that they can find work on American farms for young fellows intending to emigrate, but we know nothing of their respectability, and should think it better for you to make your arrangements on the other side. Do not step on the coast, but book right through to the West, and save your money till you get there. If you were going to Canada you could obtain all the information you want from the Canadian Government Offices in Victoria Street, Westminster.

PLUM PUDDING.—It is indeed serious to have a pudding so heavy that it made you ill. Try the following. Take a pound of currants, a pound of raisins, a pound of mixed peel, half a pound of suet, three eggs, the juice of two lemons and the peel of one, a pound and a half of bread-crumbs, a teaspoonful of mixed spice, and half a pint of milk. Chop the suet, lemon-peel, and mixed peel very fine, stone your raisins and wash your currants. Mix well, and boil for sixteen hours or longer, and you will have a pudding that will keep from Christmas to Christmas if you do not eat it, and be a credit to you hot or cold. By the way, there are only three n's in beginning.

AN ANXIOUS ENQUIRER.—There were fourteen articles on the Boy's Own Pigeon Loft, and your best plan would be to get the volume—the third—in which they appeared.

WATER-RAT.—The game of water-polo was described in the part for December, 1880.

NEW HOLME.—A cricket-scoring book can be obtained of any cricket outfitter. Messrs. Dean and Son, of St. Dunstan's House, Fleet Street, have a new and somewhat ingenious one.

STAMP COLLECTOR.—You can obtain a full and recent catalogue of almost any of the dealers that advertise on our wrapper.

ENTOMOLOGY.—The coloured plate of British Moths was in the June part for 1883.

THOMAS CRAIG.—The large limelight ought to be sufficient for the sphenoscope as described, and should give a good picture at a distance of five or six feet from the lantern. Are you sure you have not forgotten something? Read over the articles again. Several have been made from the directions given, and have been quite successful. The light should be as close to the picture as possible, and the focusing lens directly in front of it, and at a distance from it equal to its own focal length. The instrument will do for public exhibitions, the size of the picture and its distance from the instrument being regulated by the intensity of the light.

H. G. BOREHAM.—The Civil Service paper is the "Civilian," obtainable from any stationer. For particulars of examinations, etc., see the "Civil Service Candidate," a weekly circular issued by the Civil Service Department, King's College, London, price one penny.

A NAVAL CADET.—Messrs. Longman, of Paternoster Row, are the publishers of Sir George Nares's book on seamanship.

HAGGIS.—The office of the National Lifeboat Institution is in John Street, Adelphi. The secretary will send you the report on application.

E. and F.—1. Two pounds apiece is quite heavy enough for dumb-bells. If you want greater weight get things of a different shape, such as Indian clubs. 2. Neither diving nor swimming will have any tendency to contract the chest. 3. References have to be made for dates, etc.; but questions necessitating the trouble you mention are rarely undertaken. 4. Raise your hat to the lady, no matter what may be your relative social positions.

E. H. HOLDEN.—If you will draw a diagram of the earth with the ring of atmosphere round it, you will see that a vertical line passing through the atmosphere is shorter than a horizontal line drawn tangentially. The increased thickness of the watery vapour accounts for the distortion, and the increase in the apparent size of the sun at its rising and setting.

OTTO.—How do you expect us to name a bumble-bee which has first been pressed flat in a letter, and then pounded flatter still by some energetic postal authority? It is one of the red-hipped species, and that is all that we can say.

H. S. RUMSEY.—Messrs. Macmillan are Lord Tennyson's publishers. Apply to them. You can get Milton's "Paradise Lost" in Warne's Chandos Library, price two shillings.

MEO PERICULO.—Your best plan is to apply in writing to one of the large shipping companies, state your previous history and qualifications, and enclose copies of any testimonials you may have.

K. C. M. G.—1. You must get the standards from the recruiting office. They vary with the supply of recruits. 2. The Grenadier Guards have a grenade on the collar, the Scots Guards have a St. Andrew's star, and the Coldstreams have a Garter star. The Scots Guards have a diced pattern cap. The Coldstreams have a red plume in the bearskin. 3. The Scots Greys are the second regiment of Dragoons. The second regiment of Dragoon Guards is the Queen's Bays.

TURKEY (New South Wales).—The Lifeboat Fund is closed; but we purpose opening a fund for another object very shortly.

A. W. MUDFORD.—We know of no way of preserving leaves so as to withstand the rain. The leaves in the wreaths you see on tombstones are made of tin, china, or gutta-percha. It is owing to this difficulty in preservation that the immortelles are used.

SPECIAL NOTICE.

In our next monthly part two new serial stories of thrilling interest, by T. B. REED and DR. GORDON STABLES, R.N., will be commenced.

Lascelles

No. 325.—Vol. VII.

SATURDAY, APRIL 4, 1885.

REGINALD CRUDEN

A TALE OF CITY LIFE.

BY

TALBOT BAINES REED,
Author of "My Friend Smith," etc., etc.

CHAPTER I.

AN INTERRUPTED BATH.

It was a desperately hot day. There had been no day like it all the summer. Indeed Squires, the head gardener at Garden Vale, positively asserted that there had been none like it since he had been employed on the place, which was fourteen years last March. Squires, by the way, never lost an opportunity of reminding himself and the world generally of the length of his services to the family at

At the Hospital Gates.

Garden Vale; and on the strength of those fourteen years he gave himself airs as if the place belonged not to Mr. Cruden at all, but to himself. He was the terror of his mistress, who scarcely dared to peep into a greenhouse without his leave, and although he could never exactly obtain from the two young gentlemen the respect to which he considered himself entitled, he still flattered himself in secret "they couldn't do exactly what they liked with his garden!"

To-day, however, it was so hot that even Squires, after having expressed the opinion on the weather above mentioned, withdrew himself into the coolest recess of his snug lodge and slept sweetly, leaving the young gentlemen, had they been so minded, to take any liberty they liked with "his" garden.

The young gentlemen, however, were not so minded. They had been doing their best to play lawn tennis in the blazing sun with two of their friends, but it was too hot to run, too hot to hit, and far too hot to score, so the attempt had died away, and three of them now reclined on the sloping bank under the laurel hedge, dividing their time between lazily gazing up at the dark-blue sky and watching the proceedings of the fourth of their party, who still remained in the courts.

This last-mentioned youth, who, to judge by his countenance, was brother to one of those who lolled on the bank, presented a curious contrast to the general languor of the afternoon. Deserted by his companions in the sport, he was relieving himself of some of his superfluous energy by the novel diversion of playing tennis with himself. This he accomplished by serving the ball high up in the air and then jumping the net so as to take it on the other side, following up his return by another leap over the net, and so on till either he or the ball came to grief. On an ordinary day the exertion involved in this pastime would be quite enough for any ordinary individual, but on a day like the present, with the thermometer at ninety in the shade, it was a trifle too much even to watch.

"For goodness' sake shut up, Horrors," said the elder brother. "We might as well be playing ourselves as watch you at that sort of thing."

The young gentleman addressed as Horrors was at that moment in the midst of one of his aerial flights, and had neither leisure nor breath to answer.

"Do you hear?" repeated the other. "If you want to keep warm go indoors and put on a great-coat, but don't fag us to death with that foolery."

"Eight!" exclaimed the young athlete, scoring the number of times the ball had crossed the net, and starting for another jump. "Shut up, Reg, till I've done."

He soon was done. Even Horace Cruden could not keep it up for ever, and at his tenth bound his foot caught in the net and he came all fours on to the court.

"There, now you're happy!" said his brother. "Now you may as well come and sit here out of the cold."

Horace picked himself up laughing.

"All very well," said he. "I'm certain I should have done it twelve times if you hadn't put me off my jump. Never mind, I'll do it yet."

"Oh, Horace," interposed one of the others, beseechingly, "if you love us, lie down now. I'm quite ill watching

you, I assure you. We'll all vow we saw you do it twelve times; we'll put it in the 'Times' if you like, and say the net was five feet ten; anything, as long as you don't start at it again."

This appeal had the effect of reducing the volatile Horace to a state of quiescence, and inducing him to come and share the shade with his companions.

"Never saw such a lazy lot," said he, lying flat on his back and balancing his racket on his finger, "you won't do anything yourselves and you won't let any one else do anything. Regular dogs in the manger."

"My dear fellow," said the fourth of the party, in a half drawl, "we've been doing nothing but invite you into the manger for the last hour, and you wouldn't come. Can't you take a holiday while we've got one?"

"Bad luck to it," said Reginald, "there's only a week more."

"I don't see why you need growl, old man," said the visitor who had spoken first, "you'll get into the sixth and have a study to yourself, and no mathematics unless you like."

"Poor Harker," said Horace, "he's always down on mathematics. Anyhow, I shan't be sorry to show up at Wilderham again, shall you, Bland?"

"Depends on the set we get," drawled Bland (whose full name was Blandford). "I hear there's a crowd of new fellows coming, and I hate new fellows."

"A fellow must be new some time or other," said Horace. "Harker and I were new boys once, weren't we, Harker?"

Harker, who had shared the distinction of being tossed with Horace in the same blanket every night for the first week of his sojourn at Wilderham, had not forgotten the fact, and ejaculated,

"Rather."

"The mischief is," continued Blandford, "they get such a shady lot of fellows there now. The school's not half as respectable as it was—there are far too many shopkeepers' sons and that sort of—"

"Sort of animal he'd like to say," laughed Horace. "Bland can't get over being beaten for the French prize by Barber, the tailor's son."

Blandford flushed up and was going to answer when Reginald interposed.

"Well, and suppose he can't, it's no wonder. I don't see why those fellows shouldn't have a school for themselves. It's not pleasant to have the fellow who cuts your waistcoat crowing over you in class."

Horace began to whistle, as he generally did when the conversation took a turn that did not please him.

"Best way to remedy that," said he, presently, "is not to get beaten by your tailor's son."

"Shut up, Horace," said the elder brother, "what's the use of making yourself disagreeable? Bland's quite right, and you know you think so yourself."

"Oh, all serene," said Horace, cheerfully, "shouldn't have known I thought so unless you had told me. What do you think, Harker?"

"Well," said Harker, laughing, "as I am disreputable enough to be the only son of a widow who has barely enough to live on, and who depends on the charity of a cousin or some one of the sort for my education, I'm afraid Bland and I would have to go to different schools."

Every one laughed at this confession, and Reginald said,

"Oh, but you're different, Harker—besides, it isn't money makes the difference—"

"The thing is," interposed Horace, "was your father in the wholesale or retail trade—that's the difference!"

"I wish you'd shut up, Horace," said Reginald, tartly; "you always spoil any argument with your foolery."

"Now that's hard lines," said Horace, "when I thought I was putting the case beautifully for you. Never mind. What do you say to a bathe in the river, you fellows?"

"Too much fag to get towels," said Reginald; "but if you like to go for them, and don't ask us to look at our watches and see in how many seconds you run up to the house and back, we'll think about it."

"Thanks," said Horace, and started up to the house whistling cheerily.

"Awfully hot that brother of yours makes a fellow," said Blandford, watching him disappear.

"Yes," said Reginald, yawning, "he is rather flighty, but he'll turn out all right, I hope."

"Turn out!" said Harker; "why he's all right already, from the crown of his head to the sole of his boot."

"Except," said Blandford, "for a slight crack in the crown of his head. It's just as well, perhaps, he's not the eldest son, Reg."

"Well," said Reginald, laughing, "I can hardly fancy Horace the head of the family."

"Must be a rum sensation," said Harker, "to be an heir and not have to bother your head about how you'll get your bread and butter some day. How many hundred millions of pounds is it you'll come in for, Reg? I forget."

"What a humbug you are," said Reginald; "my father's no better off than a lot of other people."

"That's a mild way of putting it, anyhow," said Blandford.

And here the conversation ended.

The boys lay basking in the sun waiting for Horace's return. He was unusually long in coming.

"Seems to me," said Blandford, "he's trying how long he can be instead of how quick—for a variety."

"Just like him," said Reginald.

Five minutes passed away, and ten, and fifteen, and then, just as the boys were thinking of stirring themselves to inquire what had become of him, they heard his steps returning rapidly down the gravel walk.

"Well," cried Reginald, without sitting up, "have you got them at last?"

Horace's voice startled them all as he cried,

"Reg! Reg! come quick, quick!"

There was no mistaking either the tones or the white face of the boy who uttered them.

Reginald was on his feet in an instant, rushing in the direction of the house, towards which his brother had already started.

"What is it, Horace?" he said, as he overtook him.

"Something about father—a telegram," gasped the other.

Not another word was spoken as they ran on and reached the hall door.

The hall door stood open. Just outside on the hot stone steps lay the towels

where Horace had dropped them five minutes ago. Carlo, the dog, lay across the mat and lazily lifted his head as his master approached. Within stood Mrs. Cruden, pale and trembling, with a telegram in her hand, and in the background hovered three or four servants with mingled curiosity and anxiety on their faces.

Despite the heat, Reginald shivered as he stood a moment at the door, and then sprang towards the telegram, which his mother gave into his hand. It was from Mr. Cruden's coachman, dated from St. Nathaniel's Hospital.

"Master was took ill driving from City—brought here, where he is very bad indeed. Doctor says no hope."

One needs to have received such a message oneself to understand the emotions with which the two brothers read and re-read the pitiless words. Nothing but their own hard breathing broke the stillness of those few minutes, and who knows in that brief space what a lifetime seemed crowded?

Horace was the first to recover his self-possession.

"Mother," said he, and his voice sounded strange and startling in the silence, "there's a train to the City in five minutes. I'll go by that."

And he was off. It was three-quarters of a mile to the station, and there was no time to parley. Even on an errand like this, many would have abandoned the endeavour as an impossibility, especially in such a heat. But Horace was a good runner, and the feat was nothing uncommon for him.

As he flung himself into the train he gave one quick glance round to see if Reginald had possibly followed him; but no, he was alone; and as the whistle shrieked and the train steamed out of the station, Horace for the first time had a moment to reflect.

Not half an hour ago he had been lying with his brother and companions on the tennis lawn utterly unconscious of any impending calamity. What ages ago

that seemed! For a few minutes all appeared so confused and unreal that his mind was a blank, and he seemed even to forget on what errand he was bound.

But Horace was a practical youth, and before that half-hour's journey to the City was accomplished he was at least collected in mind and prepared to face the trial that awaited him.

There was something about the telegram that convinced him it meant more than it said. Still, a boy's hopefulness will grasp at a straw, and he battled with his despair. His father was not dead—he would recover—at the hospital he would have the best medical assistance possible. The coachman who sent the telegram would be sure to make things out at the worst. Yes, when he got to St. Nathaniel's he would find it was a false alarm, that there was nothing much the matter at all, and when his mother and Reginald arrived by the next train he would be able to meet them with reassuring news. It was not more than a ten-minutes cab-drive from the terminus—the train was just in now, in twelve minutes this awful suspense would be at an end.

Such was the hurried rush of thoughts through the poor boy's brain during that dismal journey. He had sprung from the carriage to a hansom cab almost before the train had pulled up, and in another moment was clattering over the stones towards the hospital.

The hopes of a few minutes before oozed away as every street corner brought him nearer his destination, and when at last the stately front of St. Nathaniel's loomed before him he wished his journey could never end. He gazed with faltering heart up at the ward windows as if he could read his fate there. The place seemed deserted. A few street boys were playing on the pavement, and at the door of the in-patients' ward a little cluster of visitors were collected round a flower stall buying sweet mementoes of the country to brighten the bedsides of their friends

within. No one heeded the pale scared boy as he alighted and went up the steps.

A porter opened the door.

"My father, Mr. Cruden, is here; how is he?"

"Is it the gentleman that was brought in in a fit?"

"Yes, in his carriage—is he better?"

"Will you step in and see the doctor?"

The doctor was not in his room when the boy was ushered in, and it seemed an age before he entered.

"You are Mr. Cruden's son?" said he, gravely.

"Yes—is he better?"

"He was brought here about half-past three, insensible, with apoplexy."

"Is he better now?" asked Horace again, knowing perfectly well what the dreaded answer would be.

"He is not, my boy," said the doctor, gravely. "We telegraphed to your mother at once, as you know—but before that telegram could have reached her, your poor father—"

It was enough. Poor Horace closed his ears convulsively against the fatal word and dropped back on his chair with a gasp.

The doctor put his hand kindly on the boy's shoulder.

"Are you here alone?" said he, presently.

"My mother and brother will be here directly."

"Your father lies in a private ward. Will you wait till they come, or will you go up now?"

A struggle passed through the boy's mind. An instinctive horror of a sight hitherto unknown struggled hard with the impulse to rush at once to his father's bedside. At length he said, falteringly, "I will go now, please."

When Mrs. Cruden and Reginald arrived half an hour later they found Horace where the doctor had left him, on his knees at his father's bedside.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold; the Boy-Earl," etc.

CHAPTER XV.—PRETCHISTOVA.

ON the railway from Moscow to Kursk, and about fifteen English miles from the ancient capital of "Moscovy," or "Muscovy" as we used to write it, there is a small station called Faustova. Some ten miles farther there is a village called Pretchiestova, originally a wretched collection of mean hovels inhabited by peasantry living in a state of poverty and misery hardly to be understood even by those who have seen it. But, thanks to the active mind and true benevolence of the proprietor of the land, this village has become a thriving little town, well provided with school-houses and churches by the efforts of one good man.

The whole of the land on which this village stands formerly belonged to Count Schaafstadt, but at the time of which we write much of it had been

given up to the commune to provide for the peasantry under the new system.

The peasants did not seem to value the blessings of liberty which were bestowed upon them, actually preferring their former state of serfdom, because they were not compelled under that system to *think* and act for themselves. But the active mind of our good friend the count provided against all the difficulties which the new state of things seemed to call into existence. He lived amongst the peasantry, he taught them what to do, setting them a brilliant example. And having the good of others sincerely at heart, working earnestly and honestly for them, he unconsciously enriched himself and improved his own position. It was a curious illustration of the fact that self-abnegation brings a double

blessing with it, for he who practises this virtue from a pure motive as a humble servant of Him who laid down His life for others will find not only that the good he does is good indeed, but that he himself is no loser in the end.

The count had taken Tenterton with him to this model village with a view of showing him how much can be done when one is in earnest. Tenterton had accepted the invitation because he had heard that the police-master was also expected, and he had made up his mind to acquaint this important functionary with the facts which had been gained from the examination of the documents so strangely rescued from the fire at Berozovo. Accordingly the three met at the Kremlin, where one of the count's carriages took them to the station.

On arriving at Pretchiestova the count took his guests into a spacious hall well warmed and provided with every comfort, although no fire was to be seen, and that is a very great advantage when once the prejudice in favour of looking at a fire as a source of comfort has worn away. It was cold weather, at least it would have been thought cold in England, but no snow had fallen. It was too dark to look over the estate and the village now, so beds had been prepared and the inspection was to be made the next day.

It is hardly necessary for us to say that Kakaroff had not gone down into the country for a mere outing. His thoughts were always on *business*, and he had an idea that there were certain revolutionary or radical principles active at Pretchiestova which required "looking after," hence his acceptance of the invitation from the count, to which indeed he had led by clever speeches. He was glad to have Tenterton with him, as his presence would give him many opportunities of learning what he wanted to know under the guise of asking, as though for the instruction of the young Englishman, certain questions for his own guidance.

Our three friends were very merry in the fine though simple hall, where dinner was served very shortly after their arrival. When the pleasant meal was over, none of them being addicted to smoking, they adjourned to the ladies' room, which was celebrated rather for its snugness than for any great display of elegance (for the count thought it unwise to affect display amongst the poor, who might be tempted to despise their own poverty when brought face to face with luxury). Here they began the business of serious talk, and, watching an opportunity, Tenterton turned to the police-master and said,

"Will you tell me what I ought to do with some very important documents which do not belong to me, but have found their way most mysteriously into my portmanteau?"

"That sounds more like a case for a police-constable than for the prefect of Moscow," said the count, laughing.

"I am not sure that there will not be work for him out of it, though," remarked Tenterton, gravely.

"At all events, let us have the story," said Kakaroff.

Tenterton now related the circumstances which we have heard him mention at some length already. We shall therefore pass over his narration and report faithfully what the other two said about it.

The count looked very angry indeed, and, starting up from his chair, exclaimed,

"Infamous! such conduct is disgraceful in any one, but in a noble who ought to be the guide and pattern of those who look up to him, it is simply infamous. I maintain that people in such a position as that held by Abrazoff, and who yet commit such crimes as these, ought to be punished with greater severity than the poor untaught peasant, who would be sent to the mines for life."

"Well, count," said Kakaroff, "I don't think you can know much about the severity of that punishment, or you never would think of any punishment *more* severe. It is simply an impossibility to invent such a thing! All the same, he ought to be punished. But men are all

equal in the eyes of the law, and yet the punishment which is no particular hardship or disgrace to a moujik is fearful degradation to a gentleman. However, that is not my business, I have only to look after the administration of the law, and leave legislation to wiser heads than mine. I am sorry for the disgrace which, if all this be brought home to Abrazoff, must fall upon the order, but it is no one's fault but his own."

"If it be brought home to him!" exclaimed Tenterton. "The copies which you have seen are true copies, and the lawyer, Mr. Brandt, has no doubt of the genuineness of the originals in his care. They have been carefully made by Mr. Brandt himself, who would not allow his clerks to see such documents. I knew him through our chaplain."

"Very careful indeed on his part. I always had a high opinion of Mr. Brandt, but now I feel my respect for him greatly increased. It shows him to be discreet as well as clever. A mere pettifogging attorney would have been too glad of such a case as this, and would have instantly proceeded to bring the matter into court. His application to me for advice through you shows great skill. My advice is to call in Mr. Smirnov as protector of Ivan Dobroff, and make him prosecute. Though, by-the-by, I had forgotten, quite forgotten—Ivan himself has vanished again, and telegrams are flying all over the place setting the police in motion. Smirnov was at the office quite recently with the news—I think it was only last night. Let me see!—yes, here is a note in my black pocket-book, 'Ivan Dobroff missing again!' Queer boy that!"

The count was greatly surprised at this intelligence, but Kakaroff continued,

"Oh, I am sure he will turn up again; he is pretty certain to get through any amount of trouble without being much the worse for it. I do not think the mere fact of our losing sight of him for a time need trouble those who are concerned in his future. I shall advise you, Mr. Tenterton, to put the whole business into Mr. Smirnov's hands; he will retain Brandt, by my advice; he could have no better lawyer, nor would it be fair to take it out of his hands."

Such is in a condensed form the conversation that took place after dinner in Tenterton's presence. He longed to be alone, and as soon as he saw an opportunity he asked the count's leave to retire to his own room.

"Don't you feel well, Mr. Tenterton? I hope our journey has not been too much for you. If you have taken a chill there is nothing in the world so good against bad results as a glass of tea with a slice of lemon in it taken in bed. Zver shall give you this very palatable medicine, and you will be quite well in the morning. Good night."

Tenterton took leave of Kakaroff and followed the count's advice.

Meanwhile the two Russians commenced a very serious conversation.

"I wish," said the police-master, "that you could have got rid of him before; I don't care to talk secrets before outsiders."

"Well, now we are alone," said the count, "you can say what you like."

"In the first place," said Kakaroff, "all the story told by this youngster is perfectly true. I have known for some time that Abrazoff kept the son of

his elder brother somewhere in retirement under an assumed name, and I have been led to conclude—from circumstantial evidence, it is true—that Ivan Dobroff, who has interested so many persons of distinction, is the son of that elder brother and the real heir to the whole property now enjoyed by Abrazoff."

"Have you any objection to telling me some of the grounds of your suspicion?"

"I will tell you the whole story from my point of view. I first became connected with it when the boy was missing from Maziellovo, when I was requested by a personage of very exalted position—"

"I know," was the reply.

"Yes, you know who it was. Well, I was requested to look into the matter of Ivan Dobroff myself without trusting it too much to underlings. Of course I threw myself into it and made several interesting discoveries in consequence. One of these was that a German in the Novoye Derayvnie, whom I knew to be mixed up with the revolutionary and Nihilistic fanatics, was a much more dangerous person than I had supposed; and that instead of being only a half-cracked but otherwise harmless individual, useful as a decoy and therefore under strict police surveillance, he was an influential and intelligent leader of the most dangerous organisation we ever had against the Crown. He has been examined and condemned to the mines for the term of his natural life. His daughter I tried to save, but she has been adjudged guilty in the second degree, and is condemned to exile, but not to the cruelty of hard work in the mines. My wife was greatly taken with her, and I would have run any risk to save her (of course within certain limits), but it was all in vain, and I was reluctantly compelled to see her depart in her wretched prison dress and almost frantic with grief and despair. The disagreeable part of this little episode is that she thinks I have betrayed her instead of having really done everything man could do to save her."

"Does Anna Feodorovna know that this girl has been sent away?"

"No; she knows nothing about it yet, and I have had much difficulty on account of the fancy she took to her. But to proceed. Among the persons whom I interviewed in this case were two boys and a general officer. The general gave me some very important information. It seems that during the journey down to the country place where the whole of the Dobroff mystery took its rise, there was a certain old woman to whom Mr. Abrazoff had committed a certain orphan boy to be taken care of after the affair at Plevna under Scobeleff. This old woman he called for when halting the carriage at Berozovo, and the name by which he distinguished her was the same as that mentioned by Ivan Dobroff, by the letters referring to the subject, by Tenterton, and by the priest from whom Smirnov had the boy! She was Olga Ivanovna. I had my doubts of the general and had him very carefully watched, for his account was none of the clearest. However, I find that I have done him an injustice, and that his story is after all as straightforward as it could be under the circumstances. Now come the boys, who were first of all useful to me in detecting Ivan under the disguise of a girl when

travelling with this very woman who has been exiled; and their grand use was this. They traced a likeness to Abrazoff's daughter (a girl of sixteen, very small and slight for her age) in Ivan when masquerading as a girl. This was the most important hint to me of all, and it was that which prepared me so completely for the discoveries made by Tenterton. The chain of evidence is so complete that I should feel justified in arresting Abrazoff at once and throwing him into prison for safe keeping, but I have not quite made up my mind what to do. There are many reasons against having the case brought into court. The publicity would be galling. Abrazoff is a man of the best society, though of rough and uncouth manners; more like a German than one of us; and it would involve many disclosures which I think might as well be left alone. The better plan would have been for him to be put in possession of the facts, and let him bring them forward himself of course suppressing the letters and documents discovered by Tenterton, and on his giving up possession of the property we destroy the documents. This would have been very easy to manage if these documents had not been read by so many people. It is now almost impossible to carry it out, though much depends on the English priest to whom Tenterton has spoken already."

"You can do nothing with him," said the count. "The English clergy are known for their uprightness and integrity. You can do nothing with them. Nor would I for one moment countenance a step opposed to the strict course of justice. If it were my own son who had incurred the just displeasure of the law, I myself would rather deliver him over to justice than endeavour to defeat her sacred aims by private intrigue."

Kakaroff smiled. "You know what I say to be true," said the count, indignantly.

"I have never stooped to intrigue for court favour for either myself or my friends, and I certainly am strongly opposed to showing Abrazoff any favour because he is a gentleman and ought to have known better."

"My very dear friend," interrupted Kakaroff, "nobody knows your unim-

seen anything more of Tchernyafskise. He did me good service in the hunt after Ivan, and I may thank his introduction to Director Schwann for the discovery of the boy at Kupsk. I wonder where the young scamp has escaped to now? He seems born to keep me in constant work."

"He clenched his fist after Tenterton."

peachable integrity better than I. There is no one in Russia who is more convinced of it than I. But I am not so overscrupulous by any means; in fact I have seen too much of life to feel scrupulous at anything—within certain limits, of course."

It was the count's turn to smile now, as he asked what those limits might be.

"Ah! my dear count, we are all mortal. Who can precisely tell what the limits are which shall bound his conduct under all possible circumstances? But I was just about to ask you whether you had

The police-master chatted in this way evidently, with a view to put the count in good humour, who still seemed a little sore at the off-hand manner in which Kakaroff treated his chivalric views of life. A few minutes were all that it required to put the count right. He never was very much put out, and certainly desired to believe that most Russians were, as good as himself. Hence the worldly speech of his friend jarred upon him for a few minutes, and then he was quite himself again—as cheery and bright as ever.

"I don't think I have thanked you, count, for your having made me acquainted with Tenterton. He is a study. He is a mere boy, about nineteen, I fancy, and yet he has none of those vices and follies which one is apt to see in youth. I wonder whether the English youths are all like that? England must be a wonderful place if they are! But with all his steadiness and almost matronly sedateness, there is an immense amount of freshness and fun in him. I like the ring of his laugh immensely; that

is an unfailing test" (the count's laugh was proverbially musical, so this was a very refined way of flattering him). "His teeth are good too" (so were the count's), "and that is generally a good sign. Altogether both my wife and myself are charmed with him."

"Yes," said the count, "I am very glad indeed to have secured his services for the boys, who are very fond of him; for although as steady and pure at heart as an ancient Spartan, he is a very merry companion; and with the fun of a mere boy he has the wisdom of a man of forty."

"The education of the English," said Kakaroff, "is something Spartan in its character. They don't learn anything like so much as German boys of their age are expected to know, and nothing at all in comparison with our boys in Russia. But I have come to the conclusion that the English system is the best, after all, and we should do well to copy it a little more."

The night waned, and the friends separated for their respective resting-places. As he retired for the night, the count sighed and said,

"Poor Kakaroff! Constant association with designing and cunning people has made him fancy himself one of that class, instead of being the open-hearted, generous fellow he is. I wish he were out of it!"

Kakaroff shook his head as he entered the room designed for his reception.

"Ah!" he said aloud, when the servant specially attached to him had withdrawn. "Ah, yes, poor Schaafstadt, and yet he is a very clever man and a shrewd man of business; but he has run his head against high morality of conduct, and such queer old-world notions, that one is puzzled what to think of now-a-days. And yet he is a good manly fellow too, when time and occasion require manliness. First-rate fellow he is, and so honourable that he almost makes me believe in human nature. Wonderful—very!"

Early next morning the three friends were seated in the count's open landau, each wrapped in a thick coat supplied with a stout fur collar. They drove through the wide street of the village, nearly twice as wide as our Regent Street; and Tenterton remarked with pleasure that the huts were less like hovels, and the cottages more like houses, than any others which had come under his observation in Russia. The seats at the sides of the porches were painted green, and the doors and window-shutters were not rotting to pieces for want of a little timely attention. Each house had its little garden in front. The principal church was large and well built; and although shops for the sale of strong drink were there in plenty, even they were orderly, and not suggestive of riot and ruin. At a part of the road where it branched off in two directions there was a house rather larger than the rest; the lower part of bright red brick. There was a roomy verandah or balcony, like that at the count's. In fact, there was a very evident trace in all the houses or cottages of imitating the great man who, in his love for the people, had set up something which they could imitate, and the imitation of which should be beneficial to them. The proprietor of this house was the *starosta* or head-borough of the village; and when the landau of the count stopped before his door he came out to receive the great man at the step. He greeted him with respectful reverence, displaying his venerable white locks and his long patriarchal beard.

The three gentlemen descended and entered the house of this fine specimen of the Russian peasant, who addressed the count by his baptismal name and patronymic as "Nicolai Sergevitch."

"Glad to see you, Ivan Nicolaevitch. Let me introduce my young friend, Edward Feodoritch Tenterton."

"Welcome to Pretchiestova," said the patriarch. "All friends of Nicolai Sergevitch are welcome to us."

"Thank you," returned Tenterton, in his best Russian. "It is a great pleasure to me to see Russians in Russia, although they are agreeable company anywhere."

But there was something either in the accent, or pronunciation, or both, that made it difficult for the *starosta* to follow, for he only bowed very respectfully, but said nothing.

"There was a bow, Mr. Tenterton! did you ever see one like that in England?" asked the count. "I am sure you never did. From the Lord Chancellor downwards there is nobody in England who could bow like that. You see, he gracefully admires your graceful compliment. Tell him something else."

Tenterton tried hard to hammer out something very Russian and very polite, and felt pleased to find his knowledge of Russian so appreciated. At last he asked whether the peasants did not find themselves much better off under the present system than when they were serfs.

The old man stood perfectly still, respectfully waiting for the end of the harangue, Schaafstadt and Kakaroff enjoying the joke, for they fancied they understood the peasant's puzzled look, and that he did not understand a word.

At last the count said,

"I am afraid you do not understand our young 'Professor' when he speaks to you?"

The old man brightened at this, and exclaimed,

"Ah, Batuschka! How could I, a poor uneducated peasant, take such a liberty as to understand a learned man, a barin and professor to boot? No, no, I know my station!"

This produced a roar of laughter from the count and the police-master, which rather disconcerted Tenterton, who asked rather feebly what the joke was.

"Tell you when we get home," replied the count. "Farewell, old friend," he added, as he jumped into the carriage after Kakaroff and Tenterton. "Come and draw out another Russian!"

They stopped at the door of a cottage about a quarter of a mile farther on, and here they could neither see the action nor mark the words of the old man whom they had left. He clenched his fist and spat on the ground after Edward, saying,

"Not understand! I understand well enough. It is you who do not understand the danger of bringing the foreigner, the stranger in blood, into the land. You will find it out too soon unless we wake in time, and make the whole world Russian with a mighty blow!"

But our three friends heard nothing of all this, and Tenterton continued his Russian exercises on a fine full-grown peasant of some sixty winters old. This man was more straightforward in his manner, but always as polite as the first. A Russian always is polite to strangers. Edward asked him how he liked the new *régime*, and whether the life of a peasant since the liberation of the serfs by Alexander the Good (the Second) was not much better, having all the blessings of freedom within reach.

"Well, barin," said the peasant, "I don't know about that. I don't know whether this freedom which you seem to love so much is after all worth having."

Tenterton stared.

"How! What! Not worth having!"

"No, barin. When I was young if a child

was born the barin came, made presents, and gave it at least plenty of handsome clothes. When it grew up he told the priest to teach it the holy faith, and as much reading as would be good, but no more. Then he grew older, and it became time that he should marry and have a house. So the barin would find him a nice good girl for a wife; he would give him wood for a house, and furniture to put in it—at least all *they* wanted. Then if he was ill the barin would send his doctor and the medicines from the house. If his house burnt the barin built another, and if he died the barin buried him. Now everything is changed. A poor little wretch is born into the world just to take care of itself. When it is big enough it *must* go to school, and the poor father must pay for it, and if he cannot he is punished! The child grows up to be a man; he wants a house, and he must build it himself; the barin does not care about him. He is ill; then he must pay the doctor himself; there is no fun in being ill under *such* circumstances. If he has to marry he has to look out for himself, and has all the trouble and bother of courting on his hands, and then he can't tell very often who is best suited to him. Oh, no, barin, give me the good old times of Nicolas the Brave, and a fig for your boasted freedom. It may suit foreigners and suchlike, but it is not the thing for true believers."

We must do Tenterton the justice to say that he understood very little indeed of this long speech, and that what he did understand shocked him. Again the count and Kakaroff were convulsed with laughter, and Tenterton was puzzled and perplexed.

"Is it possible," he said, "that human beings can be so lost to all sense of the dignity of their position as men as to think like that?"

"But," said Count Schaafstadt, "you see how loyal these people are to their leaders."

"I should think the fellow was trying to humbug me," observed Tenterton. "I can hardly believe that he can have sunk so low as to mean that, or perhaps I don't understand him."

"Oh, yes, you understand what he says fast enough, but I doubt whether you know what he *means*, and you seem shocked at the idea of his meaning what he says."

Tenterton was too much impressed with the sad state of society which could have produced such results to be able to think of anything else for some time. At last he broke silence.

"How great is the goodness of the Creator! These men, unlettered, untaught slaves, have yet the reasoning faculty as strongly developed as any of us. Does it not make the old saying good, that an ounce of mother-wit is worth more than a pound of learning?"

By this time they had reached the school, in which peasant children of both sexes were being taught by very clever-looking young women. There was a great fluster at the arrival of the count with two barins, but no servile homage. The children were happy to be noticed by the count, but not because he was a count, but because he was their friend and benefactor Schaafstadt. They read their little pieces from Krieff's fables, they parsed the most difficult sentences in Russian prose composition, astounded

Tenterton with their knowledge of grammar, and delighted the count with their display.

On their way back to the house Tenterton was surprised at the quantity of ingenious contrivances for the comfort of the poor in that neighbourhood, all devised by the count; and finding himself for a few minutes alone with Kakaroff, he asked him whether their host was not the best specimen of a landed proprietor in Russia.

"Oh, yes," said Kakaroff, "Schaafstadt is a very good, easy-going, kind-hearted fellow, but he spoils the peasants and makes them rogues."

"How so? How can he make them rogues by being kind and benevolent to them?"

"He makes them cheat him. The Russian peasant is naturally deep and cunning. The very Jews are no match for the Russians. How these very men who flatter him to his face slander him behind his back you cannot tell. They have gone so far as to say that all his goodness to the poor is only a trick to get a new dignity or star or something from the Emperor."

"If he has educated them so far as that they can understand the value of a star or the worth of an order, he has already worked wonders!"

"Hush, here he comes! We must finish our talk about Ivan Dobroff and arrange the plan definitely, and then home to Moscow, where I have my work cut out for me."

The early dinner passed off agreeably enough, and the subject of Ivan Dobroff was renewed on the withdrawal of the servants.

"Do you know," said Tenterton, "I think it only fair to all parties to take Mr. Smirnoff at once into our confidence; he is a good man, a kind man, and a very wealthy man. He would hardly care how much money he expended in finding Ivan, and then in seeing him righted. I also think it might be as well to request Mr. Abrazoff to be present at a meeting with a view to working on his better feelings to induce him to give up his ill-gotten possessions quietly. If he should decline to make restitution, then Mr. Smirnoff denounces him, and General Kakaroff steps in with the strong arm of the law, and force is used to obtain what kinder measures failed to get for us. Of course, it is wrong to wink at offences, or to help the offenders. By such acts we become like them; but I think it fair to give Abrazoff a chance of getting out of the trouble with a good grace. I am anxious to know how he will act when he hears the accusation."

"I quite agree with Mr. Tenterton, although I did not exactly see the matter as he puts it, for how we can ourselves become bad by doing good to others passes my comprehension."

It was agreed, therefore, that the three gentlemen should meet at the house of the police-master, and that Mr. Smirnoff should be requested to attend in order to arrange the plan of attack on the person

holding possession of the estates to be claimed by him for Ivan Dobroff.

"All this time," said Tenterton, "we have entirely lost sight of the fact that Ivan Dobroff is missing! Suppose he should not turn up at all, what should we do with the estates?"

"In that case they would revert back to the Abrazoffs; and this is another reason," exclaimed Kakaroff, "why we should refrain from taking severe measures now!"

"It is difficult to see one's way. My English blood boils at the idea of winking at this nefarious transaction; and yet, as I said just now, it may be the right thing to do to give Abrazoff a chance of escaping from the trouble and making restitution. I am chiefly led to this view of the case by two facts, the one being the near relationship existing between Ivan and him, and the other the fact that in the absence of Ivan the estates would revert to Abrazoff, unless he should forfeit them as a criminal, in which case his wife and children would be more severely punished than he."

"Well," said Kakaroff, "if you come to the abstract justice of the question, you defeat the ends of justice in your way as much as the count or I would in ours—that is, if it be justice to act so; I know it is law!"

The landau was now at the door, and that evening our three friends were again in Moscow.

(To be continued.)

DOGS. AND HOW TO TRAIN THEM.

By GORDON STABLES, M.D., R.N.

IN many accounts perhaps I had better commence by telling you, that unless you really love your dog and he loves you, and unless you can put yourself *en rapport*, as it were, with the mind of your dog through the medium of that affection, you will utterly fail in teaching him any accomplishments or tricks worthy of the name.

Patience and forbearance are two virtues which must also be studied. No amount of force work is of the slightest use. While giving the animal lessons you must never lose your temper, and, as for whip or cane or switch, it must never even be thought about, much less seen.

Dogs take a very great delight in learning tricks, and in being considered clever. They learn not only to please their masters, but to please their own canine vanity as well. Of this I am perfectly sure.

Another secret of success on the part of the teacher is to talk slowly and distinctly, and always to use not only the same words precisely, in order to convey your meaning as to what you want done, but the same intonation of voice—dogs go a deal by this—and the same looks and motions.

Indeed, I myself have often taught dogs to do certain things by dumb show alone, and would undertake to teach a clever dog to do anything a dog can do entirely by this method.

If these preliminary remarks of mine are borne in mind it will assist you very much, for they are keynotes to the whole system.

I may add that, while you are patient, kind, and forbearing, you must also be persistent and firm. And it will moreover be well to have a few tit-bits—morsels of boiled liver are best—in your pocket, with which to reward the pupil, when and only when he really deserves it. These are not absolutely necessary, for kind, encouraging words and caressing pats are preferred by most intelligent dogs to all the tit-bits you can give them.

Most boys who read these lines do, I dare say, already possess a canine friend, and some may wish to buy a dog for the very sake of teaching him clever antics. Well, be it remembered that you cannot teach all dogs precisely the same kind of tricks. You would hardly, for example, expect a great Newfoundland or St. Bernard to walk down the street after you with a hat on his head very much on one side, a roguish grin on his face, and a pipe in his mouth, but this is exactly the sort of thing a poodle could soon be taught to do.

Nearly all terriers and spaniels and collies can be taught a variety of tricks, and the wiser they are and the wiser they look the more teachable will they be. Your solemn-countenanced dog does not learn well. The best pupils are dogs with a fair amount of dash and go in them, plenty of natural affection, and also some sense of fun and humour.

Here is another hint worth remembering. Notice any peculiar trick or manner the dog has and give it a name, and he will soon do it to order.

I will give you an example or two of what I mean. Many dogs—say collies and Newfoundlands—have a habit after they have been lying in a room for some time, and just as you start up to take them out, of stretching themselves—that is, extending the fore-

paws, and lowering the body and head between them—well, I've always called this "making a bow." When you see a dog doing this of his own accord say, "Oh, the good dog! he's making a bow," and it is surprising how soon he will make a bow to order.

My Newfoundlands all do this when told, and always when introduced to any one, whether told or not.

Another example. One of my favourite Newfoundlands had a trick of his own, of leaning all his weight upon the wall of a room and pressing against it when he happened to be in a merry mood. I called this "trying to knock the house down." And now he starts this humorous antic whenever told to "knock the house down."

A still more funny trick, though not perhaps an elegant one, is that of sneezing. It was taught in the same way. A collie of mine had a habit of sneezing when she wanted the door opened. I took advantage of it, and adapted words to the trick. The words are, "Poor Eily has a violent cold." This is a command to sneeze, and she knows it. But that is not all. The other dogs soon noticed that this trick of Eily's met with due reward, and they have all learned it. So whenever I say, "My poor dogs have all got violent colds," they all start sneezing at once. But this is only just before we are going out for a walk.

A dog of mine was taught to articulate several words very distinctly on precisely the same principles. He had a habit of making strange noises when, on coming home of an evening from college, I went to let him loose. I began by making him believe he had actually said the words which his sounds in some measure resembled, and kept repeating them to him, always letting him loose the moment he said them most distinctly. I am

sorry to add that our servants—the men—took advantage of the dog's powers of articulation and taught him two, if not three, words he ought not to have said. The dog's name was Tyro, and he may be remembered by many who read this paper. He was a

dog that, once known, was not easily forgotten.

The simple word "Yes" almost any dog who barks at you to get a morsel of food can be taught to say. It is merely a subdued, half-hoarse, and half-whispered bark. You

must keep on repeating it to him over and over again, rewarding him with a tit-bit when he is successful, and appearing to be offended when he barks instead.

(To be continued.)

A Clever Dog.

THE TROUT, AND HOW TO CATCH IT.*

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

"FOR I tell you, scholar, fishing is an art, or at least it is an art to catch fish." So says the father of modern angling (Isaac Walton, who died at Winchester some 200 years ago) in his "Compleat Angler," and so say I, writing to you boys in this year of grace 1885. And if Walton found it an art to capture the comparatively uneducated fish of his time, what shall we say now, when the finest of tackle is necessary, and when all the resources of the workshop are lavished on its production. Woods from the jungle and tropical forest, whalebone from the whale, the silk of the useful silkworm, the metals of the mine, furs of rare animals, and feathers of the most gorgeous denizens of the air, are each and all utilised in the manufacture of the modern angler's equipment, and for what?—to the better conquering of that marvellous instinct of self-preservation which in the fish of our rivers to-day seems to have attained its highest development. Of all fish, the highest and best efforts are necessary for the capture of the trout. Trout-fishing is the *fine art* of all angling.

To be an accomplished trout fisherman it is positively essential to begin young. The same may be said of all sports, but especially of this. Do you want to ride well, to shoot well, to play at cricket or football or to skate well?—begin when young. Do you want to swim well or become an athlete?—you *must* begin young. Finally, as I have hinted, the

best fishermen are those who began when they were in knickerbockers. For myself, I am sure I was not five years of age when my father put a rod into my hand and I caught a three-pound bream, to my rapturous delight, mingled with a large percentage of genuine fear of the floundering fish.

Of course I am aware that unfortunately many of the readers of the BOY'S OWN PAPER are unable to get near any good trout-fishing. Their fathers and big brothers cannot, much less themselves, for the simple reason that the fish are comparatively scarce at the time of writing; yet there is no reason why even these should not attentively read, mark, learn, and inwardly digest the directions I shall put down for some future time. There are heaps on heaps of trout in Hampshire, Hertfordshire, Derbyshire, Devonshire, and in fact in nearly every shire in England, Scotland, Ireland, and Wales, and it will be odd if many of my readers cannot avail themselves of their presence. One word of caution, however. Always most civilly ask permission if you at all suspect you are trespassing. People who take the trouble to preserve fish are usually very strict with those people who think they have a right to fish anywhere and everywhere.

I shall begin these articles with details of the natural history of the trout—*Salmo fario*.

It is a very difficult matter for any writer to say something new about this beautiful fish, and consequently I shall not attempt to do so. In place thereof I intend rather to amuse myself, and also I trust the reader, by calling up such details of its familiar natural history associations and capture as may sug-

gest themselves at a season of the year when this little agile "gentleman" of the waters is at his prime, whether in mountain tarn or loch, or in gurgling rivulet, which in our home counties "maketh such sweet music with the enamelled stones" over which the waters speed with a joyous strength.

Is there another fresh-water inhabitant whose conditions of life are so palpably pleasant as those of the trout? At a time when the spring is brilliant in its budding beauty, when every alder and hawthorn is umbrageously hanging all its "leafy banners out" to catch the glinting sunbeams, and when beyond the Gothic arches of the interwoven limes the slumbrous sky reveals its pure cerulean, then does the trout, full of the "lusty" strength with which the Laureate credits him, disport himself in his crystalline habitation. The early gauze-winged insects of the year furnish him a repast from the air, and the larvæ of innumerable later ones surround him with delicacies born of the water. Green and young are the water plants from which perchance the trout often plucks a salad, and aye and anon the luscious worm or obese caterpillar drops down like a gift of myrrh—a veritable *bonne bouche*. Very different, however, is the lot of the summer spawning fish. Whilst Monsieur le Trout is regaling himself on the good things of life the members of the "coarse" fish family are miserably employing themselves in domestic duties, which reduce the enjoyment of their existence to a minimum. The pike, perch, barbel, roach, dace, carp, etc., are at this time spawning, and so exhausting is the operation that until far into the summer—when the

* See the series of articles entitled "Fish, and How to Catch Them," in Vol. IV. B. O. P., for full instructions as to pike, perch, eel, carp, barbel, gudgeon, tench, bream, dace, roach, rudd, chub fishing, etc.

water is no longer fresh and cool, when the "bright sun above laughs a pitiless laugh," and the rays fall like hot shot through the spaces of the languid trees—they are unfit for the angler, and indeed lean, poor, and inane, limp and unhandsome entirely.

Truly the trout is a favoured fish, and thus, with its beauty and wealth, we are justified in acknowledging it supreme over all but its grand congener the salmon.

Yet the trout has also its domestic duties, and these are far from being inconsiderable. As winter approaches and the coarse fish retire into the stiller and deeper parts of the river, where a more genial warmth than is found on the shallows prevails, the trout must be up and about, making nests and securing their mates. Courting in ice-cold water would seem a very undesirable pursuit to a warm-blooded animal; but though the family affairs are arduous and exhausting, often generating jealousy and even sanguinary conflicts amongst trout, the extraordinary vitality of the fish surmounts them. The ova are laid, impregnated, and covered up, the last battle royal is fought, and the last fair trout won, long betimes the stern hand of winter ribs the stream with ice, when the trout drops downward to quiet nooks, wherein in peace it awaits the first breath of spring which shall touch the water with a gracious freshening.

Again, although, as I have averred, the trout is blessed with favourable surroundings, it must be said in fairness that its infancy is fraught with many perils. Having passed the Rubicon of juvenescence, its life on the whole is full of pleasant alternations. Far different is it with the trout when as yet it is an embryo and has not assumed the miniature development which stamps it as truly the offspring of its parents. The eggs are laid in the gravel, and while even the process of vivification is going on enemies abound. Water-rats tear up the nests and devour the spawn, unfecund old trout, hungry and lean, and too weak to catch the lively minnows, will ruin the labours of their brothers and sisters; the larva of the dragon-fly, the freshwater shrimp, and many other enemies, assail both the egg and the newly-hatched fish, which presents at first rather the appearance of a tiny lump of gelatine than the prototype of the gloriously muscular adult. As the little one, however, loses its umbilical bag and becomes a trout, its voracity avenges its species on the former enemies, and thereafter its existence becomes a great battle between them and itself, to the victory in many cases of the latter. No shyer or more watchful fish swims. The carp may be more knowing, but the shade-loving trout I believe to be much more timid of man, though its personal nature is characterised by a voracity oftentimes excelling that of the pike.

As a rule it may be said that the trout are a very healthy, long-lived, and hardy fish. The diseases to which they are liable are only numerous when bred from the egg under artificial treatment. Mr. Livingstone Stone, in his splendid book on the subject of trout culture, entitled "The Domesticated Trout," gives a very formidable list of twenty-three

disorders, which are as follows: Fungus on the egg, partial suffocation of the embryo, strangulation in hatching, blue swelling of the yolk sac, deformity at birth, fungus on surface of body, constitutional weakness, emaciation, starvation, ulcers on the head, animal parasites, fin disease, black ophthalmia, irritation of the optic nerve, inflammation of the gills, black gill fever, fatty degeneration of the vitals, spotted rash, strangulation by flood, cannibalism, overheating, suffocation (through lack of oxygen), paralysis. Nor does this anything like exhaust the terrible list.

With such an array of possible ailments before us, the reader may suppose I am contradicting when I assert the general healthiness of the trout. Not so, however. The intelligent reasoner will see that most of the twenty-three so-called diseases referred to by Mr. Stone are only symptoms of constitutional disorder in the parent fish, for these really only refer to the early stages of the fish's life. Parasites are chiefly the immediate cause of loss of health in the adult fish, whether they be of internal or external nature. I am disposed to place those trout growing over a chalk stratum first in the scale for health and strength and courage. I must not, however, forget the magnificent physique of the Thames trout, which, though sometimes termed a salmon trout, is but a salmo fario, or brown trout, from the ichthyologist's point of view. Of course there is a vast difference between the brown trout of a Welsh burn, weighing perhaps on an average not more than thirteen to the pound, and that splendid Thames specimen exhibited in the window of the "Land and Water" newspaper office some time ago, which weighed 16lb. 15oz. when taken at Reading. A comparison would be too absurd, and such a fish is the production not of a chalk stream, but a heterogeneous compound which, whatever be its actual analysis, is certainly suited to the fish it possesses. Nor is such a tremendous size unapproachable absolutely. Trout have been taken as large, though the average size for the Thames fish is probably no more than six pounds. Ay! and what grand sport those fellows give on fine Nottingham tackle!

The average size of our best English trout, however, does not perhaps average more than a pound, and such fish as those in the Itchen are much more delicious on the table than the mightier products of the Thames. Though I shall briefly give some particulars of how the Thames trout is captured, I am far from expecting my young friends to be so fortunate as to get hold of one unless piloted by some veteran fisherman. The Thames trout is for the very best and most patient and skilful of anglers whatsoever, and though it is not impossible for a boy to capture one, it is extremely improbable. There are many species of trout in the waters of Great Britain, but the brown trout (*S. fario*) is the representative one, and it is chiefly with regard to him that these few remarks have been made. The first method of capture I shall advert to will be that of fishing with the natural fly, as it is probably the easiest.

(To be continued.)

OUR NOTE BOOK.

ENCOURAGEMENT FOR DULL BOYS.

How discouraging it is for a boy of moderate abilities, who aims to do his best, to be told that others accomplished much earlier what he can only do by hard study in the best days of his youth. Still, as a writer on this subject points out, such a boy has no cause to relax his efforts. Sir Isaac Newton was a pronounced dunce in his early school days. One day the "bright boy" of the school gave him a kick which caused him severe pain. The insult stung young Newton to the quick, and he resolved to make himself felt and respected by improved scholarship. He applied himself resolutely to study, and ere long stood in his class above the boy who had kicked him, and ultimately became the first scholar in the school. Oliver Goldsmith was the butt of ridicule at school. He made no progress in the exact studies, but liked history and Latin poetry. He was a sore trial to his ambitious mother, who made fruitless efforts to quicken his wits by her sharp words. His relatives, teachers, and school-mates all told him that he was a fool, which verdict he did not dispute, but took good-humouredly. And yet by close application he made up for his youthful dullness and became famous. Sir Walter Scott was a dull boy, and when attending the University at Edinburgh, went by the name of "The Great Blockhead." But he wasted no time on trifles, and pursuing a course of study that he loved, was persevering and methodical. His knowledge increased until it lay like a great volume in his mind. When he began to make use of that knowledge, society gave him another name, "The Great Magician." Adam Clark, the great commentator on the Bible, was pronounced by his father to be "a grievous dunce;" and Dr. Chalmers was pronounced by his teacher to be an incorrigible one. Teachers are apt to become impatient over dull boys, and predict of them that they will never come to anything. Such uncalled-for prophecies ought to discourage no scholar who tries to do well. If a dull boy feels an inspiration stirring within to know something worthy in literature, science, or art, let him set his face as a flint towards his object; let him be patient, hopeful, and self-reliant, unmoved by laughter and undiscouraged by evil prophecies, even looking to God for a blessing on his honest efforts, and he will succeed.

If boys should get discouraged
At lessons or at work,
And say, "There's no use trying,"
And all hard tasks should shirk,
And keep on shirking, shirking,
Till the boy became a man,
I wonder what the world would do
To carry out its plan!

The coward in the conflict
Gives up at first defeat;
If once repulsed, his courage
Lies shattered at his feet.
The brave heart wins the battle
Because, through thick and thin,
He'll not give up as conquered—
He fights, and fights to win.

GREAT SHIPWRECKS OF THE WORLD.

THE BURNING OF THE AMAZON.

A SHIP on fire in the dead of night. A heavy gale and a raging sea. The flames bursting up round the engine-room, swift and fierce enough to drive the men from the machinery before they can reach a hand to check or stop it. The blazing vessel plunging forward at increasing speed as the fire of the wreck joins with the furnace fires, begirds the boilers in its vivid sheet and multiplies the volume of the steam. The ship before the wind driving furiously, with paddles madly spinning on each side of her, the gale roaring round her, and the foam crests chasing

her in vain, as trial after trial is made to launch the boats.

"Clear the port lifeboat." "She is on fire, sir." "Clear the starboard lifeboat." "She is on fire, sir."

See the tackles fail as one after the other the remaining boats rise over the blazing side. See the boats drop as the ship leaps on at full speed; see the crews swirl out of them like peas from the shell as the boats hang down on end. The pillar of flame grows and eats its way fore and aft along the deck. The clouds are aglow with its reflection, signalling

over the wide circuit of the waters that the Amazon has met her doom!

On Friday, January 2, 1852, she left Southampton on her maiden voyage—the first ship to leave the new docks. She had been specially built by the Greens of Blackwall to excel all existing mail steamers. Her build, her fittings, and her equipment were described at length in the news of the day. She was built of wood—the largest timber-built ship afloat—with upper works and panelling of pine. She had a flush deck 300 feet long, she was "of 2,250 tons burden and 400-horse power,

and started with 1,133 tons of coal on board." She had nine boats—a mail-boat, four lifeboats, cutter, pinnace, gig, and dingy. She had a crew of 111, and "her cargo included £20,300 in specie and 500 bottles of quicksilver, worth £5,150, for mining operations in Mexico." She was guaranteed to do ten knots and a half, and might do more, and "under any circumstances the 3,622 miles to St. Thomas was to be accomplished in considerably less time than hitherto." She was commanded by William Symons, who had just prevented the massacre at Chagres and been thanked by the United States Government for having safely got the mails and gold-dust on board their frigate Cherokee. She had fifty passengers—among them Eliot Warburton, the author of that triton amongst travel books, "The Crescent and the Cross"—and when the mails, in charge of Lieutenant Brady, were taken on board from the tender, and at gradually growing speed the Amazon glided out to sea, there were none but wished and prophesied for her a prosperous voyage.

A ship's first voyage is always more or less of an experiment. The machinery is too true, and it has to work down into ease and suit itself to the varying strains. So it was with the Amazon. The bearings got heated, and water, as usual, had to be kept playing on them. She stopped off Portland Bill for them to cool, and she stopped again. The bearings grew so hot that the contents of the grease cups were seen to burst off in steam. All seemed to be put right, however, and on Saturday night the voyage was resumed; the engines settled down to persistent work. The weather became stormy, and with a rising wind dead ahead the Amazon began to chop her course through the surge.

At midnight, when a hundred miles S.S.W. of Scilly, all was quiet. The captain went below, and left Mr. Trewicke, the second officer, on the bridge. The midshipman of the watch, William Vincent, was on the quarterdeck. The look-outs were at their posts.

One of the storekeepers, coming aft, happened to look down the hatch, and saw a tongue of flame between the bulkhead and the fore boiler. At the same instant the second officer and the midshipman caught sight of sparks flying up the hatchway. The captain was sent for. As soon as the storekeeper saw the blaze he shouted down to the engineer, who was blowing off one of the boilers. The man below ran to the feed-engine to set the water supply going. He was too late.

The smoke drove him back. He called for help, and the other engineer came, and again and again they tried to make their way through the dense smoke, which grew alarmingly. The whole place burst into flames, and they fled for their lives. The feed was not turned on, and there could be no water! And the engines were left going at full speed! Meanwhile the quartermaster that went for the captain had shouted as he knocked. Some of the passengers heard him.

"The ship is on fire!"

Captain Symons was on deck in an instant, and found the flames already leaping up the hatchway and forming a barrier across the ship. In vain the chief engineer now tried to reach the engines, which were running wildly in the blaze. The men rushed to the pumps. There was no water! The hose was burnt, the Downton was in the thick of the fire, the donkey engine could get no steam.

The fire-fiend had struck at the Amazon's heart and paralysed her. The store-room was ablaze; over six hundred gallons of oil burst into the cauldron. The white curtain of flame stretched from paddle-box to paddle-box, and the smoky-yellow that fringed its edges came from the two burning boats. The vessel was put before the wind. The barrier of flame divided the deck. What happened to those in the bow no man knows; but when the Amazon went down a figure was seen still

clinging to the bowsprit end. What happened aft was this.

The quartermaster's shout awoke the passengers. One of the foreigners bounded out of his cabin with a wild cry of "Captain! captain! we go a bottom!" and the occupants of the other cabins came flocking half dressed into the saloon, and, hearing the roaring of the flames, rushed up the companion. The heat was frightful; the vessel burnt like quickmatch.

Two of the boats were on fire; seven were left—the two lifeboats, the mail-boat, the cutter, pinnace, gig, and dingy. The ship was going so fast that the captain would not launch them. Soon the fire increased so that the attempt was made. The first that was tried was the mail-boat. She was hurried over; one tackle jammed, the other ran; and, hanging up on end, the crew and passengers were spilt into the sea. As with the mail-boat, so it was with the pinnace, cutter, gig, and one of the lifeboats. The fall in every case went wrong, and the occupants were shot out into the waves. The boats were kept on cradles to keep them from shifting with the roll of the ship, and, forgetting these, much delay was caused and damage done. One man launched three boats one after the other, all in the same fatal way. The only boats that got properly off were a lifeboat and the dingy.

The scenes were heartrending. The people had the hair burnt off their heads and their flesh scorched and blistered. Many were rushing about in their blazing night-clothes. The Mail Agent dashed down for the bags, and was seen with his flesh hanging from him in strips. Some men were rolling on the deck trying to extinguish their burning shirts. One of the passengers, Mrs. McLennan, awoke her husband, and, with her child, ran up the companion. The chief officer placed the baby in the pinnace and helped her to follow, the boat filled, and was hoisted over the side. The word came to lower, and the fore-tackle stuck, and all were thrown into the sea except the poor mother, who clutched her child with one hand and the thwart with the other, and hung there as the ship tore madly on. A foreigner was shot out of one boat and picked up by another just as he was disappearing. Miss Smith jumped out from the ship and swung there, hanging to the fall. The poor victims, some with their clothes burnt off them, were running about distracted. In one place a man had his hands clasped in prayer; in another a husband was standing before his wife shielding her to the last from the flames; in another a man and wife, clasped in each other's arms, threw themselves into the blazing gulf.

The first boat to get away was the dingy; the second the starboard lifeboat. In the dingy were the midshipman, the steward, and the passenger they picked up; and the boat could hardly live in the sea. In the lifeboat was Mr. Neilson, who first told the story of the wreck. He had seen the fire, and gone below for his lifebelt. He heard the glass smash in the panels as the flame poured into the saloon, and with a long breath he rushed through the blaze on to the deck. He helped to launch the lifeboat. One of the men got into her by sliding down the paddle-box through the smoke and flame; another reached her after three trials from the blazing sponson; another struck his foot through the burning deck as he sprang in. When the boat touched the water there was a cry of "Cut away!" "Hold hard!" shouted one of the men. "Tend her off; if we drift under the cutter she will stave through us!" And so when they had cleared the cutter they were freed, and the ship left them.

Meanwhile the dingy had begun to fill, and Vincent, slipping off his boots, cut away their tops and set to work to bale her out. It was evident, however, that she would sink, and so he steered to the lifeboat and was taken aboard. A few minutes afterwards the dingy was lost. As the senior officer then

saved, the midshipman took command, and right well did he do his duty. Being on watch when the fire broke out, he was in uniform; and he was the only fully-dressed man in the boat; the others were nearly naked. To one he lent his jacket, to another he lent his flannel shirt, to another his handkerchief, and his boots came into use for baling. There were no rowlocks in the boat, and with his knife he cut them out of a spar. There were no sails, and so the masts were pitched overboard. The oars were then shipped, and, standing up in the stern-sheets, Vincent steered the lifeboat down to the ship, whose engines having ceased to work, now lay a burning basket of fire, rising and falling with the sea.

On the fore-castle were a few figures, and clustered round the wheel were Captain Symons, Mr. Roberts and the other officers, and Mr. Eliot Warburton. The foremast went first, then the mainmast, then the mizen. Suddenly the magazine blew up. At last the end came. With a wild hiss, the Amazon, with her funnels red-hot, sank in the trough of a wave, the fire-cloud vanished, and all was dark again.

The lifeboat crew thought they were the only survivors; they were mistaken. As the ship slowed, and while they were rescuing the men in the dingy, the officers left on board recovered the boats that were hanging down and filled them. The mail-boat was smashed and useless; the gig was launched, but was never heard of again.

The pinnace was secured, and Mrs. McLennan was found still clinging to her child. They were put in the bottom of the boat, and, with two other passengers and thirteen of the crew, under the command of the second engineer, they left the ship. The cutter was launched properly, and into her Miss Smith dropped from the fall. With her went two other passengers and five of the crew. The port lifeboat was hoisted to the horizontal and got clear away. She had a crew of nine, and four passengers, among whom were Lieutenant Grylls, R.N., and the Rev. Mr. Blood. Mr. Grylls had been largely instrumental in getting the boats into order again, and he took command.

Vincent's boat began to fill, and seeing no further good to be done he brought her round to the wind, and with Neilson on the look-out in the bow, and the midshipman standing at the stern, the men kept at their oars through the night. The storm lulled as the day broke. A consultation was held. The crew were divided into watches, and the course altered for the coast of France. Soon a brig was seen, and they rowed towards her. With her green caboose she looked like a foreigner, but she proved to be the Marsden, bound from Cardiff to South Carolina. Captain Evans gave them a hearty welcome, and put his ship round for Plymouth.

Mrs. McLennan's boat was knocking about till six o'clock on the Sunday evening, and then was picked up by a Dutch galliot, the Gertruida. There was no food in the boat, but in one of the pockets a little piece of crab was found, and this was given to the child. The mother had escaped in her shawl and nightdress, and when the galliot was sighted the shawl was hoisted as a signal. Most of the men were badly hurt and burnt.

Miss Smith's boat was the smallest. It was found there were no oars in her, but a passenger was despatched in the water supporting himself on a pair. By the aid of the floor boards the boat was worked towards him; he was rescued, and with the two oars the burning ship was left. One of the passengers, Strybos, took the tiller, and as he could speak no English and knew nothing of steering, the orders of the crew had to be translated to him by Miss Smith. The whole of Sunday passed in this way, and it was not till seven o'clock the next morning that the rescue came. Curiously enough, the boat was sighted by the Gertruida, and with the two crews the galliot started for Brest.

The R. M. S. Amazon off the Needles.

Lieutenant Grylls' boat was found to be sinking as soon as he pushed off; a hole had been knocked in her side. It was stopped with a waistcoat, stockings, and drawers. This boat was picked up on Sunday afternoon by another Dutch galliot, the Hellechina,

Rescue of the Cutter's Crew.

The Burning of the Amazon.

and by her the survivors were transferred to the revenue cutter Royal Charlotte, which took them home.

Of the 161 that left Southampton fifty-nine were thus saved. There is no more horrible disaster on record. The burning of the Amazon was the greatest misfortune of an unfortunate line. She was the eighth ship

her owners had lost. The Medina went down on a coral reef off Turk's Island; the Iris off Bermuda; the Solway foundered; the Tweed struck on the Alacranes Rocks; the Forth found her fate on the same rocks; the Acteon ended at Carthagena; the Demerara stranded during her trip from the builders; and the Amazon sank girl in flames on her maiden

voyage, and vanished amid a sacrifice of over a hundred lives.

Of her wreck but few traces were found. One short length of plank, however, came ashore—a piteous message from the deep to remind a brother of his loss. It drifted to the beach near Falmouth, within a few yards of where poor Symons was born.

THE HEROES OF NEW SWISHFORD:

A SCHOOL EPISODE IN FOUR CHAPTERS.

BY THE AUTHOR OF

"My First Football Match," etc., etc.

CHAPTER IV.—CONSOLATION.

OUR heroes, who in all their anticipations had never calculated on anything but fine weather and unlimited rations and congenial occupation, began to entertain serious doubts as to the joys of founding an empire as they trailed drearily along in the rain after Bowler and Gayford. The weaker of the party had no spirit to suggest anything themselves or to question what their leaders suggested; so they followed doggedly where they were led, neither knowing nor caring whither.

With Bowler and Gayford it was otherwise. They felt rather ashamed of themselves for having lost their heads earlier in the day, and resolved now to atone for it in the only way they could. They put a brave face on the situation, and tried to impart their courage to their followers.

"I tell you what," said Bowler, cheerily, as the seven stood again on the rocks at the water's edge; "it wants a good hour of dark, and the least thing we can do is to spend the daylight in looking for some proper place of shelter and something to eat, if we can find it. Suppose I and Tubbs and Braintree start to walk round this way, and you, Gayford, take the rest round the other way. If any of us find anything we'll stop till the other party come up. I've got my whistle, so we'll be sure to hear one another."

It could do no harm and it might do good, so the party tacitly fell in with the suggestion, and divided itself accordingly. Even Crashford was wise enough to feel he could gain nothing by sulking, and returned to his allegiance without demur.

"Can't we have something to eat before we start?" said Wallas.

"My dear fellow," replied Gayford, "I wish we could, but then we shall have nothing left for to-morrow."

Strange to say, Wallas disputed the matter no further, and turned with his companions to start on their tour of discovery.

Bowler kept whistling cheerily, and Gayford shouted in reply, till the two parties were out of earshot. Then each walked on in silence, eagerly scanning sea and shore in search of hope. For Bowler's party there seemed very little prospect of anything turning up, for their way lay across bare ledges of rock, with perhaps a pool to wade, or a little cape to scramble across, but never a sign of food or shelter. Braintree did indeed announce that in one place he saw a "cwab" disappear into a hole, but the chances of satisfaction from that source were too remote to be pursued.

How they longed to be back under the roof of old Swishford, and to hear the cheery bell summoning the boys to tea, and how gratefully now would they have welcomed the wholesome plenty of that often abused meal. Alas! there were no cups of tea, or eggs, or bread-and-butter going on the Long Stork.

"Of course," said Bowler, "we could

never be quite stuck up for grub as long as there's seaweed about, and if the rain goes on like this there'll be plenty of water too."

"You're wight there," said Braintree, "but seaweed and wain-water is warthah a spare diet."

"Anyhow," said Bowler, "we have got enough of the shrimps and peaches left for a good breakfast to-morrow; that's one comfort."

And they trudged on in that glorious prospect.

For an hour they toiled along the rocky shore until the daylight almost suddenly vanished, and the gloom of a damp November night fell in upon them. What was the use of exploring further? Even Bowler lost heart as he stumbled about in the dusk and heard Braintree shivering and chattering with cold beside him, and Tubbs's scarcely suppressed whimper of misery.

"Better get back to the rest as soon as we can," said he, taking out his whistle and blowing it again.

They listened, but no answer came, only the shriek of the gulls and the steady splash of the rain on the rocks.

"Never mind, we can't be long before we get round to them," said Bowler; "perhaps they've found a place, you know."

For another half-hour they toiled on, Bowler blowing his whistle every few minutes, but always without response.

"Where can they be? We're almost round at the place we started from, surely," said Bowler, "and—hullo, look out there!"

They had reached a sudden break in the coast about twenty yards across, with rocks on each side which dropped almost precipitously into the water, forming a serious bar to further progress.

They must either scramble down and wade or swim across, or else turn inland and make a long detour round the head of the chasm.

Bowler made a careful inspection of the rocks, and then said,

"I think we could do it; what do you say? If we went round we might miss the others."

"All wight," said Braintree, blowing his hands; "I'm game, so's Tubbs."

Tubbs said nothing, but stood by miserably, ready to follow Bowler's lead.

"I'll go down first," said the latter. "Mind how you come, the rocks are slippery."

He lowered himself cautiously down the steep rock, finding just enough to cling on to with his hands while he felt his way down with his feet. He got to the bottom safely, and found firm footing in a ledge of rock close to the water's edge.

"Now then," shouted he, "down you come, Braintree."

Braintree obeyed, and managed with difficulty to reach the ledge. Then Tubbs attempted. But he, poor fellow, clumsy

at all times, and now utterly unnerved by the miseries of the day, was not man enough for the venture, and, after one feeble effort, begged to be allowed to stay where he was.

"Nonsense," cried Bowler; "come on, old man, we'll help you down all right."

So Tubbs tried again. Had not the situation been so perilous, the appearance he presented as he clung wildly on to the rock with his hands and kicked still more wildly with his feet, would have been ludicrous. But it was no time for joking. The two at the bottom piloted his feet as well as they could, and encouraged him in his downward career. But before they could reach him he slipped, and with a howl fell backward into the sea.

In a moment Bowler, dressed as he was, was in beside him, holding him up and striking out to where Braintree, with outstretched hand, waited to help them in. But it was long before they could haul his half-senseless form from the water, and by the time this was accomplished, Bowler himself was so exhausted that he in turn needed all Braintree's aid to land himself. At last, however, all three were on the ledge.

But what were they to do next? Tubbs lay still half-stupefied, utterly unable to help himself. The rock they had descended frowned above them, defying any attempt to return the way they had come, and between the ledge they stood on and the rock the other side twenty yards of uneasy water intervened.

"Could we swim across with him?" said Bowler, after a little.

"I'll do my best," said Braintree.

"The thing is," said Bowler, "the tide was dead out an hour ago, so it must be coming in now. Oh, what a cad I was to lead you into this, Braintree!"

"Shut up, old man, I say," said Braintree, and he began to take off his coat and boots.

Bowler did the same.

"We shall have to leave them behind," said he. "It can't be helped. Are you ready?"

"Yes. But I say, old man, if I get done up and have to let go, don't wait for me. I'm not much of a swimmer."

Bowler hesitated.

"If I could only be sure of getting him over," said he, pointing to Tubbs, "I might come back and—"

"Hullo! I say, Bowler, look there!" exclaimed Braintree suddenly, pointing out to sea. "Wasn't that a light? Blow your whistle, I say."

Bowler obeyed, eagerly gazing in the direction indicated by Braintree. There was neither answer nor light.

"I'm certain I saw something!" exclaimed Braintree. "Blow again, old man."

And once more the whistle sent forth a shrill cry seaward, accompanied by a loud shout from Braintree.

They waited in terrible suspense, but still no answer.

"You must be wrong," said Bowler.

"No, I'm not; blow once more."

And again Bowler obeyed.

This time, sure enough, he fancied he saw a glimmer on the water; but it might be only the lights on the mainland appearing through the lifting fog.

For ten minutes they kept up an incessant whistling and shouting, their hopes growing less and less as the time passed. At length, worn out and desperate, they had given it up, and were turning once more to prepare for their swim across. But as they did so the light suddenly reappeared, this time close to the shore.

Once more, with frantic energy, they raised their signal of distress, and after a moment's terrible silence had the joy of hearing a faint shout across the water.

"It's a boat!" cried Braintree. "Whistle again to show them where we are."

Again and again they whistled, and again and again the responsive shout, growing ever nearer, came back. Presently they could even distinguish the sound of oars, and at length the dim outline of a boat loomed across the entrance of the gulf.

"Where are you?" shouted a voice in the familiar tones of the Raveling coast-guard.

"Here. We can see you. We're on the ledge here, Thomson!"

In a few seconds the boat was alongside, and the three boys were safely lifted into it.

"Where's the rest of you?" asked Thomson, as coolly as if this sort of thing was an everyday occurrence with him. "We want seven of you."

"I don't know where they are," said Bowler. "They were coming round this way to meet us. You'd better row round somewhere where we can land and look for them."

"Give your orders," said Thomson. "You've had your day's fun, and seemingly you're determined I should have my night's. Row away, mate." And he and his man turned the boat's head and pulled out of the gulf.

"I say, Thomson, have you got any grub or anything?" said Braintree, faintly.

"Grub," said the jocular coastguard. "What, hasn't you found grub enough on this here island? Anyhow, if you do want something you'd better open that there bag and see what you can find."

Bowler was too anxious to discover the missing ones to feel much appetite for food, and kept blowing his whistle as the boat slowly coasted the island.

At length, to his unbounded joy, an answering shout was heard, and the shadowy forms of the four outcasts were seen standing on the pier from which they had started two hours before.

Jubilant were the welcomes exchanged as the heroes of New Swishford once more counted their full number, and ensconced themselves snugly in the stern of Thomson's boat round his wonderful bag of food.

It did not take long to chronicle the doings of Gayford's party. After about half an hour's journey they had been pulled up by the same chasm which had nearly proved too much for poor Tubbs. Finding it impossible to cross it, they had turned inland, and for a cheerful hour lost their way completely in the fog. At length, by means of walking in a straight line, they had come again to the coast, and after much searching had

found the pier. And having found it, they resolved to keep it until the other party completed the circuit and found them where it left them.

"And how ever did you find us out, Thomson?" inquired Gayford, after the repeat had been done ample justice to. "Did your boat come ashore?"

"No, she didn't, young gentleman; and I can tell you you'll get to know how to spell her name tolerable well before you've heard the last of her."

"Oh, of course we shall get into a frightful row," said Bowler; "but how did you come to find us?"

"Why, one of you artful young scholars left a letter to his ma on his table, open for everybody to see, talking some gammon about a West Indian island, and saying you was going to lay hold of the Long Stork to get your hands in. I can tell you you have got your hands in, my beauties. There's a cart-load of birches been ordered for you at the school already."

These awful warnings failed to counteract the satisfaction of our heroes at finding themselves nearly back again in the region of blankets and hot porridge. Bowler in the name of the party magnificently presented Thomson with the odd shilling reserved for his benefit, and expressed his sorrow it was not more. But he added, if the Eliza ever turned up, he might keep everything he found on board, including twelve tins of shrimps and peaches, a bottle of hair-oil, a set of cricket-balls, and a copy of "Young's Night Thoughts;" whereat Thomson was moved with gratitude, and said they were as nice a lot of articles as ever he came across, and he did not mind saying so.

An hour later our heroes were all in bed, comfortable within and without. They were let down easy for their day's escapade, and except for colds more or less bad, and a decidedly augmented bill at the end of the term to pay for a new Eliza, as well as a regulation forbidding all sea voyages of whatever kind, they suffered no further punishment than the lessons of the day itself. To those lessons they added one more of their own accord by resolving unanimously that from that day forward they renounced all further claim to that eligible island commonly known as New Swishford.

(THE END.)

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Writing Competition.

(Continued from page 415.)

JUNIOR DIVISION (ages 12 to 14).

Prize—One Guinea.

ALEXANDER CAW (aged 13), 10, Eglinton Terrace, Ayr, N.B.

Certificates.

SAMUEL POPE, JUN., 28, Victoria Street, Aberdeen.

WALTER HOGG, Montgomery Street, Eaglesham, Glasgow.

HARRY R. BENSIA, Tyne Hall, Ilford, Essex.

FREDK. L. GRAHAM, Box 317, Brampton, Co. Peel, Ontario, Canada.

WILLIAM THOMSON, 30, Lynedoch Street, Glasgow.

CHARLES E. SAUNDERS, 18, Harley Terrace, Caister Road, Great Yarmouth.

STANLEY E. KESTIN, Charlton Villa, Selhurst Road, South Norwood.

ARTHUR HASSALL, 3, Park Road, Leek.

LEWIS B. BIGGS, 3, Park Road, St. Mary's Road, Plaistow, E.

FREDK. G. JONES, Ivy Cross, Kew, Surrey.

HARRY B. WARMAN, 5, Brighton Terrace, Chester.

WM. H. BAND, Grammar School, Coventry.

ALBERT H. LYNCH, Grosvenor House, Acol Road, West Hampstead, N.W.

EDWD. J. SHELLARD, 2, Brook Road, Bristol.

F. C. BELLAMY, 12, Drayton Park, Highbury, N.

SYDNEY R. HARDEN, Rotheras Road, Luton, Beds.

JOHN W. EUBERY, 84, Oxford Street, Reading, Berks.

HARRY FLOWER, Somerset Road, Huddersfield.

SIDNEY MASON, Grosvenor Villas, Eastern Road, Romford.

A. L. MURISON, 54, Victoria Road, Clapham, S.W.

THOS. H. CHINN, Seighford, Stafford.

E. S. HUTCHINS, 18, Alma Road, Birkdale, Southport.

JAMES ORR, 37, Lordship Park, Stoke Newington, N.

ALFRED STEVENS, 21, Green End, Whitchurch, Salop.

JOHN S. BARKER, Chapel Street, Appleby, Westmoreland.

GEORGE HADLEE, High Street, Leyton.

G. H. HUNT, Prospect House, Dursley, Gloucestershire.

WM. GREENWOOD, 19, Garden Street, Todmorden.

FRANK SAMPSON, Beauchief Abbey, Sheffield.

ALFRED TYNDALL, 281, High Holborn.

ROBT. HARVEY, 15, Beacon Hill, Camden Road, N.

TOM LEMMEY, 101, Granville Terrace, Dover Road, Folkestone.

ADOLPHUS BROWNLOW, Brook Cottage, Worsley Road, Whinton, near Manchester.

CHAS. E. WARREN, Whittlesea, Cambs.

JAMES M. MUNGALL, 11, Gladstone Place, Leith.

BENJAMIN HALL, 40, Lansdowne Street, Worcester.

ARTHUR H. ADAMS, 20, Carlton Cross Street, Leeds, Yorkshire.

CHAS. GODFREY, 3, Princes Street, Ware, Herts.

ERNEST R. POLLEY, 3, Stoneleigh Villas, Limes Road, West Croydon.

JAMES F. BROWN, 55, West Cumberland Street, Glasgow.

ARTHUR E. SHAW, 60, Breeze Lane, Walton-on-the-Hill, Liverpool.

JAMES D. BROWN, Auchenheath, Anerley, S.E.

A. W. PRIESTLEY, Schoolridge, Thornton, near Bradford.

THOMAS G. FIRTH, Whiterock, New Barnsley, near Belfast.

HERBERT M. GOWAR, 2, Rose Valley, Brentwood.

W. J. JOHNSTON, The College, Inverness.

WM. STEWART, 1, N. Claremont Street, Glasgow.

WILFRED H. SMITH, 9, Regent's Park Villas, Oval Road, N.W.

E. DE VIVELESLEY M. BARRON, Echinghen, près Boulogne-sur-Mer, France.

FREDK. C. WRIGHT, 22, Hinckley Road, East Dulwich, S.E.

WM. GRANT, Hopetoun Villa, Dumfries.

ERNEST C. GAY, Bradmore College, Chiswick Lane, Chiswick, W.

AVAON D. THOMAS, Oak Villa, Cymmer, near Pontypridd.

JAS. PEARSE, 8, Shandon Crescent, N. Merchiston, Edinburgh.

F. W. DANIELS, 3, St. James's Road, Leicester.

WM. A. STEVENS, Hillside House, Foxgrove Road, Beckenham, Kent.

PERCY W. FRENCH, 33, Howell Road, Exeter.

BERTRAM A. MEREDITH, 61, Tresillian Road, St. John's, S.E.

ALFRED EMERSON, 46, Aswell Lane, Louth.

W. J. BARDWELL, Stone House, Ipswich.

W. YOOL CRAIGIE, 132, Prince Albert Buildings, Edinburgh.

WM. MOORE, Lisbellaw, Co. Fermanagh, Ireland.

SYDNEY M. DAWKINS, 97, Brackenbury Road, Preston.

LOUIS HOLLAND, Navigation House, Northwich, Cheshire.

J. L. ASHTON, Wrawby, near Brigg, Lincolnshire.

THOS. W. ARKWRIGHT, 146, Aylesbury Street, Wolverton, Bucks.

CHARLES M. KNOWLES, 18, Broad Street, Hereford.

A. G. MORSE, 15, St. James Barton, Bristol.

MERVILE E. PLUMPTON, 13, Baldwin's Crescent, Flodden Road, Camberwell, S.E.

JOHN E. RILEY, Aberleigh Lodge, Trewsbury Road, Sydenham.

CHAS. H. WEDGWOOD, Park Road, Hockley, Birmingham.

GEORGE J. MAGUIRE, Royal Academical Institution, Belfast.

FREDK. W. P. SOUTHEY, Ranson's Timber Yard, Southtown, Great Yarmouth.

A. BRANWELL, 14, Marmora Road, Honor Oak, S.E.

F. K. PARKINSON, 105, Meadow Lane, Leeds.

GEORGE ELLIOTT, Newland, Sherborne, Dorset.

JOHN FARNWORTH, 25, George Street, Bolton.

CHAS. F. RICHARDS, 1, Dilston Terrace, Gosforth, Newcastle-on-Tyne.

CHARLES H. GILES, 3, Western Street, New Swindon, Wilts.

WALTER H. STURTON, 12, Cambridge Road, Lee, S.E.

NEVILLE L. STOCKEN, 3, Heathfield Road, Acton, W.
 ERNEST W. BLACKLER, 34, Windsor Place, Cardiff.
 EDWARD ROFF, Meyrick Crescent, Mersea Road, Colchester.

JOHN RENWICK, Blairlodge School, Polmont Station, N.B.

ALBERT SIMMS, 2, Sandrock Villa, Southfields Road, Wandsworth.

A. B. SIMSON, 16, Hardwick Terrace, Stockton-on-Tees.

SALOMON VAN RAALTE, 8, Arundel Place, Barnsbury, N.

H. B. MUIR, 1518, St. Catherine Street, Montreal.

WALTER E. TOWNSEND, Beaufoy Arms, Lavender Hill, S.W.

J. R. C. STEPHENS, Stratton St. Margaret, near Swindon.

M. W. EVERETT, Wrotham House, Isleworth.

E. W. HARRIS, 16, Finchley Road, St. John's Wood, N.W.

GEORGE TOLHURST, 10, Faunce Street, Kennington Park, S.E.

JOHN G. WEDDELL, Park Villa, Uddington, near Glasgow.

ROBERT CRAWFORD, Royal Academical Institution, Belfast.

WM. CHAMBERLAIN, 9, James Grove, Peckham.

LEONARD BROWN, 28, Shardeloes Road, New Cross, S.E.

JOHN HART, 4, Marine Crescent, Waterloo, near Liverpool.

WALTER A. REEVE, Aubury Road, Walthamstow.

H. C. GLAYSHER, 67, James Street, Oval Road, Regent's Park.

REGINALD TOLMAN, 4, Northampton Buildings, Julian Road, Bath.

GEORGE SHEPHERD, 170, Fox Street, Pitsmoor, Sheffield.

PHILIP S. DEERING, The Bank, Tipton.

G. H. STANCLIFF, Wokingham, Berks.

ROBERT FORSYTH, East Bank, Lenzie, N.B.

ARTHUR CULLIS, 69, Judd Street, W.C.

MATTHEW A. HAIG, Neilston by Glasgow.

J. D. MCARTHUR, Inveran Cottage, Inveran, Sutherlandshire.

ERNEST A. COX, Watlington, Oxon.

NEIL MACVICAR, Manor Manse, Peebles, Scotland.

A. R. FARWIG, 22, Weighton Road, Anerley.

ARTHUR BRAILSFORD, 9, Peel Street, Ashbourne Road, Derby.

ARTHUR F. YELL, 3, Stanley Villas, Rossiter Road, Balham, S.W.

THOMAS TIERNEY, 230, Victor Street, New Clee, Great Grimsby.

THEOPHILUS WATKINS, 4, St. John's Terrace, Buckhurst Hill.

THOMAS PADMORE, Humberstone Road, Leicester.

A. W. POLLARD, Hall's Yard, Calvert Street, Norwich.

JAMES EVINS, 26, Chilcot Street, Poplar, E.

FRANK CUTLER, 103, Yeldham Road, Fulham Palace Road, Hammersmith, W.

JAMES WRIGHT, Langton Street, Cathay, Bristol.

JOHN P. H. STEIN, Kirkfield, Lanark, N.B.

HAROLD J. FITTER, 82, Oglander Road, East Dulwich, S.E.

CHAS. H. COLE, 12, Plimsoll Street, Poplar, E.

SYDNEY F. D. SMITH, 47, Greenhill Street, Manchester.

EDWARD A. B. FORSTER, Gladstone Street, Hartlepool, Durham.

JOHN M. F. ROSS, 257, West Campbell Street, Glasgow.

WM. C. DAWSON, Northgate Place, Hessel, near Hull.

CLARENCE D. POLE, 3, Russell Terrace, Chapel Fields, Coventry.

THOMAS RUTHERFORD, 16, Gladstone Terrace, Edinburgh.

WM. J. KEITH, Beulah House, Grange Road, Ealing.

DAVID L. PALK, Longfleet, Poole, Dorset.

DAVID ELCOMBE, 154, High Road, Kilburn.

WILLIAM COLE, 2, Balmoral Villas, Clova Road, Forest Gate.

HENRY J. THORNE, Hook Cross, near Winchfield, Hampshire.

ROBERT BARCLAY, 55, Cumberland Street West, Glasgow.

JOSEPH MANTON, 34, Harborne Road, Edgbaston, Birmingham.

FRED. G. LEMMEY, 101, Granville Terrace, Dover Road, Folkestone.

HERBERT LLOYD, 1, Church Road, Clacton-on-Sea, Essex.

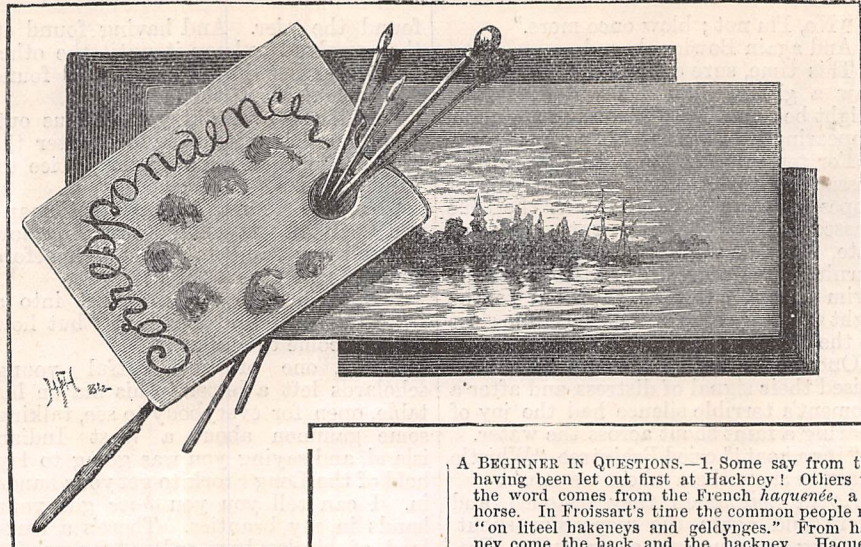

EDWIN J. TOYE, 8, Bonner Lane, Victoria Park, E.

JOSEPH J. TERRETT, 10, Owen's Row, St. John's Street Road, E.C.

CHAS. F. HOOK, 66, Ladywood Road, Birmingham.

WM. C. MARSHALL, Park Hill, Bexley.

HARRY S. TARGETT, 10, High Street, King's Lynn.

HERBERT BURY.—The egg you send is that of the Tree-Pipit, and is a very nicely-marked example. The eggs of this bird are extremely variable, and often hard to identify. We never answer correspondents by post.

ENTOMOLOGIST.—Your insect is not a beetle, but a bug, and is called *Acanthosoma hemorrhoidale*. It is not at all uncommon.

JOHN LONG.—The beetle about which you ask is *Asty-nomus ædilis*, an insect generally found in Scotland, where it is known by the name of Timberman. It has a way of flying with its long antennæ stretched out behind it, giving it a very curious appearance about on the wing. It is by no means common.

LADDIE.—You will hardly be able to tell in so young a collie pup how it may turn out. We presume it is a long-coated one. The coat should be very abundant, straight and massive, not fine and silky; the tan light, not mahogany. This last would indicate a cross with Gordon setter. Legs straight; breach well feathered down to hocks; forelegs feathered behind. Head long, and eyes bright and intelligent. If you have the back numbers of the Boy's Own containing Dr. Gordon Stables's "Boys' Dogs," you will find the collie fully described therein.

DORBER, JUN.—You must buy your oil colours in tubes ready mixed.

M. D. E. W.—Smoke the case with tobacco, and sprinkle spirits of camphor about it. A valuable case like yours ought to be moth-tight. Two grains of corrosive sublimate in spirits rubbed about the case will kill the moths. Mind, this is rank poison, and should be carefully put away.

C. I. H.—The only way to cure a pigeon of cold is to put it away from all the others in a warm place and pen, and to feed on nourishing food; a little treacle with a pinch of Epsom salts in it may be given as an aperient to commence with, and the head often bathed with warm water. Little else can be done. Hemp-seed may be given, however.

HENWIFE.—You cannot get your hens to sit? Perhaps they are not the sitting kind. What breed are they? Try Dorkings, they will sit; and a Cochin will sit on a brick rather than sit at all.

J. R. C.—A perfectly workable small set of photographic apparatus can be had for a couple of guineas. Apply to Marion and Co., Soho Square, and other dealers.

W. B. (Manchester).—The only reason we can assign is either that the battery power is insufficient, or that there is some break of contact or imperfection in the line. The case is one of weakness or leakage.

H. L. HAMERTON.—You must have a gun licence, no matter what variety of gun or pistol you wish to carry.

P. MATES.—The book usually procured is "The Sportsman's Gazetteer and General Guide," by Charles Hallock, published by the Orange Judd Company of New York. It gives you all the American game animals, with full scientific descriptions, all the fishes, etc., and occupies very much the same position in the States that Stonehenge's "British Sports" does here. Its price in New York is three dollars.

CASTLEROCK.—1. Keep your violin strings in a tin canister. 2. They require no grease in dressing previous to use. 3. If the hair is much tangled you would find it better to buy a new hank. 4. Some players dip their finger-tips in vinegar.

SANDY MCGREGOR.—1. The plate of Highland Tartans was issued with the March part for 1883. 2. Dr. Stables's stories are republished in separate books by Messrs. Hodder and Stoughton.

S. E. TAYLOR.—There is the Worcester, at Greenhithe, but the fees are higher than you mention. The office is at 72, Mark Lane, E.C., and from there you might obtain information as to what you require.

A BEGINNER IN QUESTIONS.—1. Some say from their having been let out first at Hackney! Others that the word comes from the French *haquenee*, a cob horse. In Froissart's time the common people rode "on liteel hakeneyes and geldynges." From hakeney come the hack and the hackney. Haque is, however, the Romance for a horse, and haqueny would be a little horse. 2. Pins are now made by machinery at Redditch and elsewhere. They are made out of wire.

VIOLIN.—The articles on how to make a violin were in the parts for November and December, 1882.

H. N. BRIDGE.—A coloured plate of the badges worn on the caps of officers in the mercantile marine was given with the November part for 1881.

COLLECTOR.—1. A first-class passenger steamer consumes nearly a ton of coals for every mile she runs. 2. Stamps are usually printed in sheets of two hundred and forty. 3. Yes.

MAZEPPA.—The Shadow Show was in the January part for 1882; and it is again in print, price sixpence.

A. H. R.—The articles on making a Cardboard Engine, etc., were in the parts for December, 1882, and January, 1883.

KIRK OR NO.—1. You are right. Wolfe was not the first to capture Quebec from the French. It had been captured by Kirk from Champlain in 1627. It was given back, however, to the French by the treaty of St. Germain, which transferred to them Canada, Acadia, and Cape Breton. 2. The story in "Evangeline" is the French account. As a matter of fact, the settlers were only turned out after years of warning.

W. G. W. (Bookshelf).—The earlier numbers can only be obtained in part form, and you must get the parts. The cost of the numbers you want, equal to four parts, including postage, will be half-a-crown, but through a bookseller you would save the postage. Had you given your address we could have furnished you with the name of one who would supply you.

F. MARSHALL.—Had you gone to the publisher instead of the discount bookseller you would have got the book, and saved yourself the "looking foolish" both to the bookseller and to us.

W. T.—Samuel Lover wrote "Handy Andy." It can be got in different editions through almost any publisher. Try Routledge or Warne.

C. P.—Try corn-starch paste, which is not so likely to mould and stain the paper. Dissolve the starch first in cold water, and then cork it thoroughly. Let it be rather thin.

SOADY.—In our fourth volume you will find a series of articles on the Orders of Knighthood, and we cannot repeat. There were two coloured plates with them.

W. KERSLAKE.—The British Museum was established in 1753, and the first meeting of the trustees took place on the 4th of December in that year.

VIRGINIA.—Sovereigns are said to have been first coined in the time of Henry VII., and they were so called from the monarch in his robes being represented on them. The first sovereigns were also known as Rose Rials.

T. S. K.—1. Any nautical warehouse. 2. Centre-boards are really false keels that you can raise or depress at pleasure. They are convenient for shallow waters. Nearly all sailing canoes are fitted with them. See "Practical Canoeing."

A. E. C.—A "bull" is a Stock Exchange speculator who buys securities in the hope of disposing of them at a profit; a "bear" is a man who sells in the hope of buying them back at a cheaper rate. See Warne's Standard Commercial Handbook.

A. N. D.—For the rockwork for small ferneries use cement moulded into the shape you please, and paint it with dry colours mixed in boiled oil, which will dry dead on the cement.

MODEL YACHT.—Instructions in painting and varnishing boats were given in the October part for 1882.

C. WEDEMAYER.—Model panoramas, etc., are to be obtained at Murray's, in Great Queen Street, W.C.

No. 326.—Vol. VII.

SATURDAY, APRIL 11, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

"Bent down and kissed the wet cheek of the boy."

REGINALD CRUDEN :

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER II.—A COME-DOWN IN THE
WORLD.

MR. CRUDEN had the reputation of being one of the most respectable as well as one of the richest men in his part of the county. And it is fair to say he took far more pride in the former quality than the latter. Indeed, he made no secret of the fact that he had not always been the rich man he was when our story opens. But he was touchy on the subject of his good family and his

title to the name of gentleman, which he had taught his sons to value far more than the wealth which accompanied it, and which they might some day expect to inherit.

His choice of a school for them was quite consistent with his views on this point. Wilderham was not exactly an aristocratic school, but it was a school where money was thought less of than "good style," as the boys called it, and where poverty was far less of a disgrace than even a remote connection with a "shop." The Crudens had always been great heroes in the eyes of their school-fellows, for their family was unimpeachable, and even with others who had greater claims to be considered as aristocratic, their ample pocket-money commended them as most desirable companions.

Mr. Cruden, however, with all his virtues and respectability, was not a good man of business. People said he let himself be imposed upon by others who knew the value of money far better than he did. His own beautiful estate at Garden Vale, rumour said, was managed at double the expense it should be; and of his money transactions and speculations in the City—well, he had need to be the wealthy man he was, said his friends, to be able to stand all the fleecing he came in for there!

Nevertheless, no one ever questioned the wealth of the Crudens, least of all did the Crudens themselves, who took it as much for granted as the atmosphere they breathed in.

On the day on which our story opens Mr. Cruden had driven down into the City on business. No one knew exactly what the business was, for he kept such matters to himself. It was an ordinary expedition, which consisted usually of half a dozen calls on half a dozen stock-brokers or secretaries of companies, with perhaps an occasional visit to the family lawyer or the family bank.

To-day, however, it had consisted of but one visit, and that was to the bank. And it was whilst returning thence that Mr. Cruden was suddenly seized with the stroke which ended in his death. Had immediate assistance been at hand the calamity might have been averted, but neither the coachman nor footman was aware of what had happened till the carriage was some distance on its homeward journey, and a passer-by caught sight of the senseless figure within. They promptly drove him to the nearest hospital, and telegraphed the news to Garden Vale; but Mr. Cruden never recovered consciousness, and, as the doctor told Horace, before even the message could have reached its destination he was dead.

We may draw a veil over the sad scenes of the few days which followed—the meeting of the widow and her sons at the bedside of the dead, of the removal of the loved remains home, of the dismal preparations for the funeral, and all the dreary details which occupy mourners in the house of death. For some time Mrs. Cruden, prostrated by the shock of her bereavement, was unable to leave her room, and the burden of the care fell on the two inexperienced boys, who had to face it almost single-handed.

For the Crudens had no near relations in England, and those of their friends who might have been of service at such a time feared to intrude, and so stayed

away. Blandford and Harker, the boys' two friends who had been visiting at Garden Vale at the time of Mr. Cruden's death, had left as quietly and considerately as possible; and so great was the distraction of those few sad days that no one even noticed their absence till letters of condolence arrived from each.

It was a dreary week, and Reginald, on whom, as the elder son and the heir to the property, the chief responsibility rested, was of the two least equal to the emergency.

"I don't know what I should have done without you, old man," said he to Horace on the evening before the funeral, when, all the preparations being ended, the two boys strolled dismally down towards the river. "You ought to have been the eldest son. I should never have thought of half the things there were to be done if you hadn't been here."

"Of course, mother would have known what was to be done," said Horace, "if she hadn't been laid up. She's to get up this evening."

"Well, I shall be glad when to-morrow's over," said Reginald; "it's awful to have it all hanging over one like this. I can't believe father was alive a week ago, you know."

"No more can I," said the other; "and I'm certain we shall not realise how we miss him for long enough yet."

They walked on for some distance in silence, each full of his own reflections.

Then Horace said, "Mother is sure to want to stay on here, she's so fond of the place."

"Yes, it's a comfort she won't have to move. By the way, I wonder if she will want us to leave Wilderham and stay at home now."

"I fancy not. Father wanted you to go to Oxford in a couple of years, and she is sure not to change his plan."

"Well, I must say," said Reginald, "if I am to settle down as a country gentleman some day, I shall be glad to have gone through college and all that sort of thing before. If I go up in two years I shall have finished before I'm twenty-three. Hulloo, here's mother!"

The boys ran forward to greet Mrs. Cruden, who, pale but smiling, came quietly down the garden towards them, and after a fond embrace laid her hands on the arm of each and walked slowly on between them.

"You two brave boys," said she, and there was a cheery ring in her voice that sent comfort into the hearts of both her sons, "how sorry I am to think of all you have had to go through, while I, like a silly weak woman, have been lying in bed."

"Oh, mother," said Horace, with a face that reflected already the sunshine of hers, "how absurd to talk like that. I don't believe you ought to be out here now."

"Oh, yes, I ought. I've done with that, and I am strong enough now to stand beside the boys who have stood so bravely by their mother."

"We'd be a nice pair of boys if we didn't, eh, Reg?" said Horace.

Reginald's reply was a pressure of his mother's hand, and with a rainbow of smiles over their sorrowful hearts the three walked on lovingly together; the mother with many a brave cheery word striving to lift her sons above their trouble not only to hope of earthly comfort, but to trust in that great Father of

the fatherless beside whom all the love of this world is poor and fleeting.

At length they turned to go in, and Mrs. Cruden said,

"There is a letter from Mr. Richmond, the lawyer, saying he will call this evening to talk over some business matters. I suppose he will be here by now."

"Couldn't he have waited till after to-morrow?" said Horace.

"He particularly asked to come to-night," said the mother. "At any rate, I would like you both to be with me while he is here. We must not have any secrets from one another now."

"I suppose it's about the will or the estate," said Reginald.

"I suppose so. I don't know," said Mrs. Cruden. "Mr. Richmond always managed your father's business affairs, you know, so he will be able to tell us how matters stand."

They reached the house and found Mr. Richmond had already arrived and was awaiting them in the library.

Mr. Richmond was a solemn, grave personage, whose profession was written on his countenance. His lips were so closely set that it seemed as if speaking must be a positive pain to him, his eyes had the knack of looking past you as though he was addressing not you but your shadow on the wall, and he ended every sentence, no matter what its import, with a mechanical smile, as though he were at that instant having his photograph taken. Why Mr. Cruden should have selected Mr. Richmond as his man of business was a matter only known to Mr. Cruden himself, for those who knew the lawyer best did not care for him, and, without being able to deny that he was an honest man and a well-meaning man, were at least glad that their affairs were in the hands of some one else.

He rose and solemnly greeted the widow and her two sons as they entered.

"I am sorry to intrude at such a time," said he, "but as your late husband's adviser, I considered it right to call and make you acquainted with his affairs."

Here Mr. Richmond smiled, greatly to Reginald's indignation.

"Thank you," said Mrs. Cruden; "sit down, please, Mr. Richmond."

Mr. Richmond obeyed, dubiously eyeing the two boys as he did so.

"These are your sons, I presume?" said he to Mrs. Cruden.

"They are," said she.

Mr. Richmond rose and solemnly shook hands with each of the lads, informing each with a smile as he did so that he was pleased to make his acquaintance.

"You wish the young gentlemen to remain, perhaps?" he inquired, as he resumed his seat.

"To be sure," said Mrs. Cruden, somewhat nettled at the question; "go on, please, Mr. Richmond."

"Certainly, madam," said the lawyer. "May I ask if you are acquainted with the late Mr. Cruden's state of affairs?"

"I wish to hear that from you," said the widow; "and with as little delay as possible, Mr. Richmond."

"Certainly, madam. Mr. Cruden honoured me with his confidence on these matters, and I believe, next to himself, I knew more about them than any one else."

Here Mr. Richmond paused and smiled. "In fact," continued he, "I may almost say I knew more about them than he did himself, for your excellent husband, Mrs.

Cruden, was not a good man of business."

Reginald could not stand the smile which accompanied this observation, and said, somewhat hotly,

"Look here, Mr. Richmond, if you will say what you've got to say without laughing and speaking disrespectfully of my father, we shall be glad."

"Certainly, Master Cruden," said the lawyer, a trifle disconcerted by this unexpected interruption. Then turning to the widow he continued,

"The fact is, madam, the late Mr. Cruden was, I fear, under the impression that he was considerably better off than he was."

Mr. Richmond paused as if for a reply, but as no one spoke he continued,

"I am sorry to say this appears to have been the case to a much larger extent than even I imagined. Your late husband, Mrs. Cruden, I believe spent largely on his estate here, and unfortunately kept no accounts. I have frequently entreated him to reckon over his expenditure, but he always replied that it was considerably under his income, and that there was no need, as long as that was the case, to trouble himself about it."

A nervous movement among his listeners was the only reply the lawyer received to this last announcement or to the smile which accompanied it.

"Mr. Cruden *may* have been correct in his conjecture, madam, although I fear the contrary."

"If my father said a thing," blurted out Reginald at this point, "I see no reason for doubting his word."

"None in the least, my dear Master Cruden; but unfortunately your father did not know either what his income was or what his expenditure was."

"Do *you* know what they were?" said Reginald, not heeding the deprecating touch of his mother's hand on his.

"As far as I understand the state of your father's affairs," said Mr. Richmond, undisturbed by the rude tone of his inquisitor, "his income was entirely derived from interest in the stock of two American railways, in which he placed implicit confidence, and in one or the other of which he insisted on investing all capital which came to his hand. The total income from these two sources would in my opinion just about cover Mr. Cruden's various expenses of all kinds."

There was something like a sigh of relief from the listeners as Mr. Richmond reached this point. But it died away as he proceeded.

"In his choice of an investment for his capital Mr. Cruden consulted no one, I believe, beyond himself. For some time it seemed a fortunate investment, and the shares rose in value, but latterly they took a turn for the worse, and early this year I am sorry to say one of the railways suspended payment altogether, and Mr. Cruden lost a considerable portion of his fortune thereby."

"I heard my husband say some months ago that he had made some slight loss in the City," said Mrs. Cruden, "but I imagined from the light manner in which he treated it that it was quite trifling and would be quickly repaired."

"He did hope that would be the case. Although all his friends urged him to sell out at once, he insisted on holding on in the hope of the railway recovering itself."

"And has it recovered?" asked Mrs. Cruden, with a tremble in her voice.

"I regret to say it has not, Mrs. Cruden. On the contrary, it was declared bankrupt a few days ago, and what is still more deplorable, it has involved in its own ruin the other railway in which the remainder of your husband's property was invested, so that all the shares which stand in his name in both concerns are now worth no more than the paper they are printed on."

Mr. Richmond came to the point at last with startling abruptness, so much so that for a moment or two his listeners sat almost petrified by the bad news, and unable to say a word. The lawyer finished what he had to say without waiting.

"Your husband heard this lamentable news, Mrs. Cruden, on the occasion of his last visit to the City. The only call he made that day was at his banker's, where he was told all, and there is no reason to doubt that the shock produced the stroke from which he died."

"Mr. Richmond," said Mrs. Cruden, after a while, like one in a dream, "can this be true? What *does* it all mean?"

"Alas! madam," said the lawyer, "it would be no kindness on my part to deny the truth of what I have told you. It means that unless you or your late husband are possessed of some means of income of which I know nothing your circumstances are reduced to a very low point."

"But there must be some mistake," said Horace. "*Both* railways can't have gone wrong: we shall surely save something?"

"I wish I could hold out any hope. I have all the documents at my office, and shall be only too glad, Mrs. Cruden, to accompany you to the bank for your own satisfaction."

Mrs. Cruden shuddered and struggled bravely to keep down the rising tears. A long pause ensued, every moment of which made the terrible truth clearer to all three of the hearers, and closed every loophole of hope.

"What can be done?" said Horace at last.

"Happily there is Garden Vale," said Reginald, and there was a choking in the throat of the heir as he spoke; "we shall have to sell it."

"The contents of it, you will, Master Cruden," said the lawyer; "the estate itself is held on lease."

"Well, the contents of it," said Reginald, bitterly; "you are not going to make out they don't belong to us?"

"Certainly not," said Mr. Richmond, on whom the taunt was quite lost; "unless, as I trust is not the case, your father died in debt."

"Do you mean to say," said Horace, slowly, like one waking from a dream, "do you mean to say we are ruined, Mr. Richmond?"

"I fear it is so," said the lawyer, "unless Mr. Cruden was possessed of any means of income with which I was not acquainted. I regret very much, Mrs. Cruden, having to be the bearer of such bad news, and I can only say the respect I had for your late husband will make any assistance I can offer you by way of advice or otherwise a pleasure."

And Mr. Richmond bowed himself out of the room with a smile.

It was a relief to be left alone, and Mrs. Cruden, despite her weakness and

misery, struggled hard for the sake of her boys to put a brave face on their trouble.

"Reg, dear," said she to her eldest son, who had fairly broken down, and with his head on his hands was giving vent to his misery, "try to bear it. After all, we are left to one another, and—"

The poor mother could not finish her sentence, but bent down and kissed the wet cheek of the boy.

"Of course it means," said Horace, after a pause, "we shall have to give up Garden Vale and leave Wilderham too. And Reg was sure of a scholarship next term. I say, mother, what *are* we to do?"

"We are all strong enough to do something, dear boy," said Mrs. Cruden.

"I'll take care *you* don't have to do anything, mother," said Reginald, looking up. "I'll work my fingers to the bones before you have to come down to that." He spoke with clenched teeth, half savagely.

"Even if we can sell all the furniture," continued Horace, taking a practical view of the situation, "it wouldn't give us much to live on."

"Shut up, Horace!" said Reginald. "What's the use of making the worst of everything? Hasn't mother had quite enough to bear already?"

Horace subsided, and the three sat there in silence until the daylight faded and the footman brought in the lights and announced that coffee was ready in the drawing-room.

There was something like a shock about this interruption. What had they to do with men-servants and coffee in the drawing-room, they who an hour or two ago had supposed themselves wealthy, but now knew that they were little better than beggars?

"We shall not want coffee," said Mrs. Cruden, answering for all three. Then when the footman had withdrawn she said,

"Boys, I must go to bed. God bless you and give us all brave hearts, for we shall need them."

The funeral took place next day. Happily it was of a simple character, and only a few friends were invited, so that it was not thought necessary to alter the arrangements in consequence of Mr. Richmond's announcement of the evening before. But even the slight expense involved in this melancholy ceremony grated painfully on the minds of the boys, who forgot even their dead father in the sense that they were riding in carriages for which they could not pay, and offering their guests refreshments which were not theirs to give. The little cemetery was crowded with friends and acquaintances of the dead—country gentry most of them, who sought to show their respect for their late neighbour by falling into the long funeral procession and joining the throng at the graveside.

It was a severe ordeal for the two boys to find themselves the centres of observation and to feel that more than half the interest exhibited in them was on account of their supposed inheritance.

One bluff squire came up after the funeral and patted Reginald on the back.

"Never mind, my boy," said he; "I was left without a father at your age. You'll soon get over it, and your mother will have plenty of friends. Glad to see you up at the Hall any day, and your brother too. You must join our hunt."

next winter and keep up the family name. God bless you!"

Reginald shrank from this greeting like a guilty being, and the two desolate boys were glad to escape further encounters by retreating to their carriage and ordering the coachman to drive home at once.

A few days disclosed all that was wanting to make their position quite clear. Mr. Cruden's will confirmed Mr. Richmond's statement as to the source of his income. All his money was invested in shares of the two ruined railways, and all he had to leave besides these was the furniture and contents of Garden Vale. Even this, when realised, would do little more than cover the debts which the next week or two brought to light. It was pitiful the way in which that unrelenting tide of bills flowed in, swamping gradually the last hope of a competency, or even means of bare existence, for the survivors.

Neither Mrs. Cruden nor her sons had been able to endure a day's delay at Garden Vale after the funeral, but had hurried for shelter to quiet lodgings at the seaside, kept by an old servant, where in an agony of suspense they awaited the final result of Mr. Richmond's investigations.

It came at last, and, bad as it was, it was a comfort to know the worst. The furniture, carriages, and other contents of Garden Vale had sufficed to pay all debts of every description, with a balance of about £350 remaining over and above, to represent the entire worldly possessions of the Cruden family, which only a month ago had ranked with the wealthiest in the county.

"So," said Mrs. Cruden, with a shadow of her old smile, as she folded up the lawyer's letter and put it back in her pocket, "we know the worst at last, boys."

"Which is," said Reginald, bitterly, "we are worth among us the magnificent sum of sixteen pounds per annum. Quite princely!"

"Reg, dear," said his mother, "let us be thankful that we have anything, and still more that we may start life owing nothing to any one."

"Start life!" exclaimed Reginald; "I wish we could end it with—"

"Oh, hush, hush, my precious boy!" exclaimed the widow; "you will break my heart if you talk like that! Think how many there are to whom this little sum would seem a fortune. Why, it may keep a roof over our heads, at any rate, or help you into situations."

"Or bury us!" groaned Reginald.

The mother looked at her eldest son, half in pity, half in reproach, and then burst into tears.

Reginald sprang to her side in an instant.

"What a beast I am!" he exclaimed. "Oh, mother, do forgive me! I really didn't think what I was saying."

"No, dear Reggie, I know you didn't," said Mrs. Cruden, recovering herself with a desperate effort. "You mustn't mind me, I—I scarcely—know—I—"

It was no use trying. The poor mother broke down completely, and on that evening it was impossible to talk more about the future.

Next morning, however, all three were in a calmer mood, and Horace said at breakfast, "We can't do any good here, mother. Hadn't we better go to London?"

"I think so, and Parker here knows of a small furnished lodging in Dull Street, which she says is cheap. We might try there to begin with. Eh, Reg?"

Reginald winced, and then replied, "Oh, certainly; the sooner we get down to our right level the better."

That evening the three Crudens arrived in London.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy Earl," etc.

CHAPTER XVII.—THE FRESH TROUBLE.

It had not occurred to any one that Ivan might have gone out for a walk. He seldom went out alone, it is true, and his being absent from his room when Mr. Smirnoff sent for him to see Tenterton was alarming when viewed in connection with his having been lost once already.

If that mischance had not taken place the household would have been less alarmed. But the lost sheep is the dearest of all in the fold, and recovered treasure gains tenfold in value from having once been missed. Ivan had, as we already know, become very dear to Smirnoff, and his second disappearance filled him with dismay.

When Tatiana entered the study and announced that the boy was lost the shock was so severe that it was difficult to describe its effect upon her master. It was premature in Tatiana to do this; and the former trouble had prepared Smirnoff to believe the worst.

When he arrived at Kakaroff's he was nearer weeping than he had been any time since his childhood, and his disorder was so apparent to the police *chef* that he advised a doctor in the first instance.

"I will see all the doctors in Moscow if you like," said Smirnoff. "Only help me to find my little pet. How that boy has twined himself round my heart no one can tell, and I *must* have him back! How much shall I offer as a reward?"

"Nothing at all publicly. It may just be offering a premium to these rascals, whoever they are, encouraging them in their villainy. On the other hand, if you like me to make it known amongst my

people that a handsome reward is offered to any one who can find him, it might be as well. Anyhow, the idea of the reward must be confined to the detectives. Pray do not talk about the matter to anybody."

"Certainly not. I put the matter into your hands and am not going to withdraw it. Good morning."

The second disappearance of our hero happened on this wise. He felt a longing for fresh air; he had been sitting a long time over his school-books, but without deriving any benefit from them. At last he said, aloud,

"I must take a walk, that will clear my head."

Now it so happened that he was wearing his brown suit, not his Gymnasium uniform, but the hat and light overcoat which he wore with them were in his sitting-room. His head felt so odd and queer that he never noticed them, and he passed out on to the corridor without meeting a soul or thinking of his hat or coat.

He went downstairs, and, seeing his uniform cap and mantle in the hall, thought it better to put them on than to go all the way back up so many stairs to fetch the articles which belonged to the suit he wore. He therefore put on the cap and mantle and walked out.

He had not gone far when he was overtaken by an *izvoschick* with a splendid prancing horse, who reined in his steed and hailed our hero.

"You want to ride, barin? I'll take you cheap, wherever you like to go; jump in, barin."

So Ivan jumped in.

"Where to, barin?"

Now Ivan had no plans at all, but on being asked this question, and not knowing of the terrible work that had been going on in the place where Annie was used to live, it struck him that he ought to go and see her. Accordingly he said,

"Do you know the Novoye Derayvnie?"

"I should rather think so!"

"Schouvalovsky Peryoulok."

"All right, barin; fifty kopecks?"

"All right," replied Ivan, and off they flew.

Arriving within the precincts of the old house, Ivan paid the driver and descended. He had no trouble in recognising the place, although it was evidently in much worse repair than it was when Ivan was there before. The house especially seemed greatly changed for the worse. The tumble-down doorway had tumbled down entirely; the windows looked still more dissipated and revolting, like the human eye after bad courses. The court could not look more repulsive than it had done, and yet there was a something about the place that made our hero shudder.

Ivan certainly did not feel comfortable in the society of those by whom he found himself surrounded, but he put a bold face on the matter and asked a venerable-looking old rascal with a white beard half a yard long and a head of hair as white as the driven snow, whether he knew what had become of Hermann and Annie.

"Batuschka!" ["Little father," a common ejaculation.] "What next? they have been promoted."

This was unintelligible to Ivan, who said, simply,

"I did not know he was in the service," a speech which seemed to give general satisfaction, as it was greeted with a perfect yell of delight.

"Never mind them, duschinka!" cried a hag such as is hardly to be dreamt of out of Russia, unless a very indigestible supper has been indulged in. "Never mind, my dove, they are only laughing at you. Come with me, you shall see Annie; I know where she is. Come with me, dear; come with me!"

Greatly disliking his self-elected guide, Ivan recoiled from her touch, and, addressing a younger woman in the costume of a peasant and with a charming red handkerchief bound round her head,

practicable portions of blackened and grimy flooring over which they passed.

A very dark corridor was now entered, through which Ivan had never passed before. The girl made a sign to some person behind Ivan, who turned and stumbled as a crashing blow from a bludgeon struck the back of his head and felled him in an instant. Had he not stumbled just at that moment, thereby baulking the blow, he might never have

"Now," said Ivan, "tell me one thing—where am I?"

"Where are you? Why, where should you be but among your friends? This is 'Dom German,' you know, that you used to be so fond of."

"And where is Hermann? and where is his daughter?"

"You asked me that question before," said the old man, "and I told you they were promoted."

"Ivan, looking more like a savage Indian, jumped round him."

asked her whether she knew where Annie Feodorovna was.

"I know where they are," she answered, drily.

"Will you take me to them?"

"Yes; with pleasure."

"She cannot," said the old woman. "Natasha always tells lies; she can't help it. I will take you to them; she can't, she knows nothing about it."

The old woman tried to seize his hand, but he eluded her grasp, whilst the younger one looked jeeringly at her. Some rough fellows, with sallow complexions and black glossy hair, red shirts and loose white trousers, closed up the passage made by Natasha in the little mob of childish misery that had flocked into the yard. So she bore off our hero to the very wing of the house in which Annie had lived, but which now looked desolate indeed.

"Come along, barin," said Natasha; "you see I know the way. Come along."

And Ivan was just beginning to feel assured as she led him into the house, turning round to assist him over the less

spoken more, and this story would never have been written. He fell forward as though dead, senseless from the cowardly attack.

When he came to himself he was lying on a low truckle bed in a cellar, perfectly divested of clothing. A greasy quilted bed-cover had been thrown over him; no traces of his watch, clothes, or money were visible. On a miserable deal chair, blackened with all kinds of grease and dirt, lay some shabby articles of peasant's clothing, which seemed as though intended for him. He raised himself up and found that he was in a cellar dimly lighted by a grated window sunk below the surface of the court.

No one could describe the horror of the poor boy at finding himself precisely where he most dreaded to be. When he recovered from the surprise the first object he beheld was the old rascal with the venerable beard whom he had seen on entering the court. He had in his hand a cup of the species of thin beer called *qvass*, which he offered to Ivan. The boy was thirsty, and drank eagerly.

"How can that be? they were not in the service!"

"What a boy it is! The Emperor has promoted them."

Suddenly the possible meaning flashed across Ivan's mind, his guess being greatly assisted by the expression in the old man's face. "You don't mean—oh, you don't mean to say—Siberia?"

"Look here, my boy, if you use bad language in this house we have the means of punishing you—ah! and of making it quite impossible for you to offend like this again! First, there is the *knut* [a whip—or knout, as it is often written], then there is this," producing a large knife such as is used by the Russian butchers in their work, "and these nice quiet cellars tell no tales!"

"They would tell tales in my case, for though I did not tell Mr. Smirnoff that I was going to see Annie, he will guess it soon enough, and my friend General Kakaroff will be after you again. Besides, you would lose the reward?"

"What reward?" asked the old man, with a sudden gleam in his eye. "Will

there be a reward for such an imp as you?"

"A big one, I am sure, this time. Let some one write to Mr. Smirnoff and tell him that I am safe and well, that if a fair reward be offered I shall be given up, but if not I shall have to be buried in the cellar." The poor fellow shuddered with horror, recollecting what he had heard of those cellars of old. Then he added, "I say, if I am to wear those clothes, just hand them over and help me dress."

The quiet tone of command had its effect on the old man, who went slowly forward to pick up the things indicated. Gently Ivan rose from his recumbent posture without a sound. Being unencumbered by clothes, his motions were free and sure as those of a tiger on the spring; and just as the old man stooped to pick up the red cotton shirt which had fallen down, the boy threw himself on him, rolling him over by the suddenness of the attack. In the fall the old villain's head came into contact with a large stone in the uneven floor with such violence as to stun him for the moment. Taking advantage of this, Ivan tore some of the printed calico with which the quilt was covered into strips and rapidly bound the hands of his prostrate foe. Then feeling for the butcher's knife, which he found under the "caftan" which the old man wore, he cut strips from the stout cloth and bound the legs firmly together. He next pulled some of the wool and tow with which the coverlet had been stuffed into a sort of heap of wadding, from which he selected enough to thrust into the mouth of the old rogue. This he bound up with strips of the dirty calico, leaving the nose free for respiration.

The old scamp had returned to consciousness before all these operations were complete, but he was evidently unnerved by the fall, if not weakened by loss of blood, which now trickled from the wound. Ivan, looking more like a savage Indian than a Russian, jumped round his victim, brandishing the knife, and declaring that if the old fellow moved or tried to escape, or to free himself from his bonds, he would run the weapon into him.

Dazed and scared, the victim lay still while Ivan dressed himself in the clothes to which we have before alluded. But as the old man came more and more to himself he began to work with his hands so as to loosen the bonds. And so quietly was this done that Ivan would never have noticed the attempt thus made at freedom had he not, as soon as his toilet was completed, turned the prisoner over to see whether all were in order, and then he discovered that the bandages were giving way.

"Ah! would you?" he cried. "Now, look here, you old scoundrel, you had better lie still. These cellars tell no tales, you know!"

This bold speech had its due effect, and Ivan, taking advantage of it, stealthily glided from the place, taking the knife with him as a weapon of self-defence. But on leaving the cellar he remembered to stop and lock the door behind him, taking the key with him.

Thus guarding against pursuit, at least from his more immediate enemy, Ivan fled up the stairs into the court, through which he sauntered with as cool and unconcerned an air as he could assume.

The extreme pallor of his face from excitement, the filthy nature of his dress, and his wild hunted expression of countenance were all passports for him in that uncouth district, where a respectfully dressed person would at once have attracted the attention and excited the cupidity of the aborigines. So Ivan crossed the court cleverly enough, but once through the gates and in the street, boy nature could stand it no more; he cast but one look behind him and ran. Oh! how he ran for bare life, until he came into a wide open space, in the centre of which was the fountain whence the water-carriers drew supplies for the neighbourhood.

This was a centre from whence six streets diverged. Here he paused and looked round him, uncertain which direction to take, so he walked into a butcher's shop to ask his way of the presiding genius, a stout greasy Russian with a broad red face, black beard, no perceptible whiskers, bushy eyebrows, sunken eyes, very small, very piercing, and supernaturally bright. His black hair was parted accurately down the middle, like a woman's, but was cut so as to hang down straight behind, though not allowed to grow long enough to hide the nape of the neck, which was carefully cleared of all hair whatever. He wore a long caftan or coat reaching down to the calf of the leg and up to the neck, where the white cravat was disclosed. The high boots were crinkled about the ankle like the bellows of an accordion, which is reckoned a beauty in boots by the Russians. His apron professed to have belonged to the class called white, but the colours produced upon it by time and the exercise of his profession had long since rendered its claim to that distinction obscure. The shop was a low-browed beetling shed with a pent-house roof to keep off the weather, and behind was the dwelling-place of the butcher and his family. To this man Ivan, guided by a good-humoured twinkle in his eye, applied with the question, "Which is my way to the Straytinka?"

"Why, you are coming from it. You must be a stranger about here not to know that. From what part of the world do you come, youngster?"

"I was living in the Loubiyanka last." "Then how is it you don't know the way?"

"I have not been much about."

"Oh, indeed!" said the butcher, with a grin; "too much engaged in study, I suppose?"

"Just so," said Ivan, taken off his guard.

The butcher became suspicious and eyed Ivan more narrowly, until he became aware of the knife stuck into his girdle. He advanced to the boy, and laying one hand on his shoulder said,

"Look here, my bit of a boy, you! I wonder what you have been up to. There is something wrong about you. Now, for instance, what are you going to do with this knife?" drawing it from Ivan's girdle. "Hulloa? Why, Sascha! Come here. Look! This is the knife! Now, my man, what have you got to say for yourself? This knife is my property and was stolen from me the week before last. How did you get hold of it? Never mind. Peter, run for the budeschnik; I will hold the thief till he comes. Now be off."

It was vain for Ivan to protest his innocence. In vain he told the butcher

that he was a pupil of the First Gymnasium and where he lived.

This last assertion seemed very much to amuse the butcher, who exclaimed, "Why that is the most expensive house in the whole street! and all the servants there are rich people, well provided for. There is not one among them, no, not the poorest dvornik in the house, who would not be ashamed to own such a brat as you. Besides, there are no thieves there. Oh! here is the budeschnik. This boy is a thief; take him to the *Tschast* [district police office], and I will go with you to swear that this knife was stolen from me and I found it on him."

"Have you any witnesses to finding it on him?"

"Oh, yes; my man Peter Ivanoff saw me take it from this young thief, and he can bear witness to the fact of its being mine. Those are the initials of my name and surname, and that cross he made himself with a lot of little brass-headed nails that were knocking about the place."

"How did you come by this knife?" said the policeman.

"I found it," answered Ivan.

"Oh, yes, of course, but where?"

"In the *Novoye Derayvnie*."

"How did you get there? You said you were a stranger," interposed the butcher.

"I went to see some people whom I wanted to find. I was taken prisoner, stripped of my clothes, and found this knife on the person of an old man who would have killed me."

This was received by the police-soldier with great delight, as an amusing piece of ill-directed satire on his powers of discrimination.

"Well," he replied, "it would have been a pity to kill such a nice promising young felon as you. But if you are afraid, you must be under *police protection*, you know."

This sally was received with a roar of laughter from the now indignant butcher and his help. The scene had attracted a small crowd of idlers, a police corporal came up, and the two dragged off poor Ivan.

(To be continued.)

OUR NOTE BOOK.

TATTOOING EXTRAORDINARY.

A tramp was lately apprehended by the Leicester police, he having been found "climbing a lamp-post to get a drink." He was, when searched, found to be tattooed from his shoulders to his feet, the police description of his marks being: "Letter D and ship on breast, together with a house, pigeons, anchor and chain, haystack, fishes and trees, a man driving a sheep, a pig, the Union Jack, the Prince of Wales's feathers, an anchor, two inscriptions, 'Love me and leave me not' (Shakespeare), and a gravestone to 'The memory of all I love,' a Highland girl dancing, a Highland soldier and another soldier wearing a red coat, cross flags and bayonet, drum and sticks, a pile of shot, W. F., a gun, another gun and crossed flags, crossed pipes, and a jug and glass; on the right arm an ensign, sailors, a ship, a cross and a large fish, a sailor with crossed flags, and 'Charlotte' in capital letters; on the left arm a policeman taking a man into custody, and Faith, Hope, and Charity; on the left leg a man; on the right leg a woman and a flag." Could any folly well exceed this?

THE GOLD FISH.

BY REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER I.

EDWIN ASTON was a day boy at Highfield House. His parents were in India, and he lived with a maiden aunt. She rented a fine Elizabethan mansion standing in a grand old-fashioned garden, with terraces and steps and statues, and yew hedges cut into fantastic caricatures of beasts and birds.

Not least among the attractions of that garden was a fountain in the middle of the lawn, with a commodious basin, in which had lived for many years a red carp. This fish was the pride and delight of the maiden aunt. She did not care for pets as a rule; not a pug, nor a poodle, nor a parrot ever found sufficient favour in her eyes to merit adoption. But this carp was very dear to her heart. She had found him in the basin ten years before when she first came to live in Chesterton House. Perhaps he was the last of a family. He was a burly fish when she first knew him, and looked as if he might have grown fat upon other members of his race, the last by natural selection because the strongest. And ten years' careful feeding at the hand of his mistress had increased his burliness in due proportion.

Now, on the day marking the commencement of this story Miss Davis had occasion to pay a visit at a distance of some seven or eight miles. Her chariot and horses were ordered for 2.30 p.m. She was standing, clad in robes of state, on the broad steps of her porch. Her nephew was at her side, receiving her parting instructions. She was cautioning him against the temptation of angling for the red carp during her absence.

I know not what could have suggested the necessity of such a caution. Edwin was a well-disposed lad, by no means addicted to mischief, and had never shown the slightest inclination to meddle with the carp. Miss Davis may have noticed an unusual twinkle in his eye, and deemed it to portend angling intentions. Or she may have read the Billingsgate announcement in the paper that morning, or something else might have roused her suspicions. I cannot tell. But as she had never before hinted at the possible perpetration of such an outrage, and as it had never entered Edwin's mind to plot the capture of that fish, it was odd that Miss Davis should have called the boy and said to him, in a solemn and impressive voice, "Edwin, I am going for a drive this afternoon. Now mind, I forbid you to try and catch the gold fish!"

Edwin opened his mouth with astonishment, stared at her a moment, and answered, "All square, aunt."

"Edwin, I don't like that expression. You must be more careful of your words. I am afraid the Highfield boys teach you bad language."

Edwin looked even more astonished, not to say hurt, and as his aunt turned to ascend into her chariot, a casual observer might have noticed that he pursed up his lips as though to whistle.

When left to his own devices Edwin Aston reflected for a few moments, and

his thoughts, if put into words, would have been, "What does aunt mean? I don't want to catch the carp; I'm going for a walk with Dawson. He's coming round at three o'clock. It's nearly that now. There he comes down the road! Hullo, Jackdaw! Come in. Aunt's gone for a drive. Let's have some gooseberries!"

"Jolly!" cried Dawson. "Don't she mind?"

"Mind? No! She's an old brick, and lets me have as many as I like."

This was literally true. Miss Davis showed her wisdom in allowing her nephew to help himself to fruit at his discretion. She often said, "Edwin, you may take what fruit you please, only promise me that you will not be greedy, nor pick it unripe, nor eat the skins and stones." Was not she a sensible person? And Edwin obeyed her commands; and because he could at any time enjoy himself in the kitchen garden, he never abused the privilege. He cared not to fall upon the spoil like a starved lion. Oh, no. He was fastidious in his tastes, and would select the reddest in preference to the biggest strawberry, and preferred the small ripe yellow gooseberries to the large unripe green ones.

The two boys therefore made for the gooseberry bushes. Dawson was but little accustomed to such a treat, and Edwin was amused at the voraciousness of his appetite.

"Why, Jack, you gulp them down like an ant-eater!"

"Rather! If your aunt was a gooseberry I'd eat her!"

Dawson's gluttonous appetite was at length appeased, and the boys walked round the well-stocked beds of cabbages and beans and peas, and looked at the young apples and pears, and speculated on their destiny when ripe next term, and wandered off to the pigsty and stirred up the old sow with a bean-pole and made her snort. Talking and laughing merrily, they then repaired to the lawn and extemporised a game of cricket with a croquet-mallet and a tennis-ball, and played till they were hot.

"I say, Aston, it's awfully warm! Do you think we might bathe in the fountain? Hullo, what a fat fish! Let me find him a bluebottle!"

This was soon done. The carp lifted his nose and deftly sipped in the bluebottle, and seemed to ask for another.

"How jolly the water looks! I may bathe, mayn't I, Aston?"

"I don't mind. It's not very deep, and I don't suppose you'll be drowned."

Dawson soon disrobed and stepped in. The water was up to his waist. He flopped about, and began to flounder round the basin.

"Ha, ha! See if you can catch the carp, Jack! I'll stop him. Here, old fellow, not so fast! Steady! Wo, ho, my boy!"

On came the puffing Dawson like a white grampus. The carp grew alarmed, and exerted himself to escape, lashing

the water with his broad tail as though he were a screw steamer. Edwin strove to check the monster's progress with the croquet-mallet. The chase grew exciting.

"Now, quick! Here! Got him? Hold tight! What a slippery old curmudgeon he is! Ha, ha, ha!"

The sport waxed hot. The carp, unused to such violent exercise, gasped and puffed and put forth all his energies in the struggle to elude capture. Dawson continued manfully floundering round the basin, and more than once seemed on the verge of success, but the slippery fish invariably escaped. How long this aquatic entertainment might have lasted under uniformity of circumstances I cannot say. But at length it was summarily cut short by an unexpected manœuvre on the part of the carp, who made a prodigious leap when opposite the overflow pipe, and fell head downwards into it, disappearing all but his tail. This *début* was entirely unforeseen by the boys.

"I say," cried Edwin, "the carp has taken a header down the pipe! Stop him, Harry! Catch him by the tail. Oh, what a go! Can't you pull him out?"

Harry valiantly tried to seize the fish by his tail. A super-piscine wriggle enabled the carp to get completely out of reach, and the boys were put *hors de combat*.

"What will aunt say? Shan't I catch it!" cried Edwin.

"You duffer, Aston! if you catch it you can put it back in the fountain, and it will be all right. But I know! Happy thought! You run down to the pond, where the pipe comes out, and I'll pour a bucket or two of water down the pipe, and swill him out, and you can easily catch him."

"Oh, yes; we'll have him. Wait—let me get a couple of buckets."

These were soon fetched from the stables. One was given to Harry Dawson. Edwin took the other and scampered through the laurel hedge down to the pond, where the overflow pipe discharged the superfluous water. Planting his feet firmly, he held the bucket under the mouth of the pipe, and shouted,

"All serene; fire away, Jack!"

Dawson at once poured a bucket of water down the pipe, and then another, and even a third.

Edwin heard the subterranean gurglings which indicated the progress of the water, and anxiously waited for the appearance of the carp. Gurglings continued, and grew more pronounced. Water slowly trickled. Edwin's heart beat fast. There was a sudden commotion, a bursting report. Fish and water came out with a rush, and filled the bucket so suddenly that the weight of it was too much for Edwin. His feet slid on the treacherous clay, and in the flash of a moment, bucket, water, fish, and boy fell with a promiscuous splash into the pond.

"Hasn't he come out yet?" shouted Harry. "What a time he is! I must give him another dose."

Two more bucketfuls were poured in. Just as Edwin's head appeared out of the muddy water, the clean cataract burst in his face and sent him back again into the mud.

Harry, hearing no answer to his inquiry, thought he had better see what was going on down below. Clad in the garb of a young Dyak of Borneo, he threaded the mazes of the laurel hedge, and emerged to see the results of the direful catastrophe.

"What are you up to, Aston?"

"Up to! Come and help me out, you donkey! Don't stand there gaping like an owl. Oh, this horrid mud!"

The Dyak skipped nimbly down to the water's edge, and Edwin was soon rescued. Poor Edwin! Misfortunes seldom come singly. The carp was at large in the pond. He himself, encased in mud, resembled an Egyptian mummy. The clouds of his aunt's displeasure gathered gloomily on the horizon.

"Look here, Harry, you must make haste and dress and get my Sunday

clothes. You know my room. Bring a shirt as well and some socks and boots."

"However did you manage to tumble in?"

"Never mind how I managed it. Look sharp and get my things."

While Harry was gone Edwin lay down in the sun, thoroughly disgusted with fortune. He naturally dreaded his aunt's wrath. He was vexed that the awkwardness of the carp should have brought such trouble upon him. His muddy clothes would be sure to betray him, to say nothing of the absconding carp. Edwin did not see that it was his fault. Who could have imagined that the fish would try such a desperate venture as to escape through the overflow pipe? What could he say when his aunt questioned him? He was not going to get Harry into a row. He should simply say he had not caught the carp. She had told him not to, and he had obeyed her. She could not blame him. His tumbling into the mud was an accident, and accidents will happen in the best regulated family.

Edwin was not in a good humour when

Harry returned with the dry clothes. During the operation of changing dress Harry suggested that they should get a rod and bait a hook with a bluebottle and try and catch the carp.

"There's a rod in the stable," said Edwin, "but I won't try. Aunt said I wasn't to catch the brute."

"Well, but she didn't mean that you were not to try and catch him if he was mad enough to jump down the pipe into the pond. If a man was going to leap off London Bridge and I caught him by the coat-tails I don't suppose it would be an assault" [Harry's father was a solicitor]; "though if he were walking along the road and I did so he might lick me with his walking-stick, and I couldn't say a word."

"Yes you could, and you would; you'd howl like a maniac. But I'm not going to disobey. Aunt said, 'Edwin, you're not to try and catch the gold fish,' and she blew me up when I said, 'All square.'"

"Well, she'll blow you up a lot more when she knows that you drove him down the pipe."

"I didn't drive him down; you did."

"Steady! Wo, ho, my boy!"

"No, I'm sure I didn't."

"Yes, you did; quite as much as me, and more."

"Well, I'm not going to argue about it. If you like to sneak I can't help it."

"I'm not going to sneak, but you're just as much to blame as I am."

"All right; I don't care."

"No, but I do. That's the difference."

Harry soon afterwards took his leave without further ceremony. And Edwin ruefully gathered up his soiled garments, and as he wended his way towards the house he heard the sound of carriage wheels coming up the drive. He knew that his aunt had returned, and with that knowledge came an oozing away of all hope.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER I.—THE FOSTER-BROTHERS.

YOUNG Colin McLeod's eyes were not nearly so wide open as they ought to have been on this beautiful August afternoon. He was lying on the grass

"That interesting youth found himself sitting on the opposite bank."

at full length, but with his head on his half-raised arm, because he did not wish the ants and other inquisitive creepie-creepies to get inside the collar of his shirt.

Books were close beside him—two of them—one open, one shut. Colin was meditatively chewing the white or root end of a rush, and his long dark eyelashes swept his somewhat pale cheeks, but when he gave an occasional glance upwards at the trees above, it could be seen that those eyes of his were very dark, expressive, and somewhat thoughtful withal.

He had come to this wood all alone, with the intention of studying, for it was Friday, and to-morrow an epitome of all the work of the week would form the subject of examination; if he passed this, then—well and good; if he should blunder and forget—Dominie Clayton would go straight to the desk for the two-fingered hard leathern tawse, and Colin's fingers would soon after have to smart for it, Dominie Clayton being what was called "a tickler with the tawse."

The book that lay open was "Arnold's Latin Grammar," and, until it had slipped from his listless grasp, Colin had been deep in the mysteries of the gerund in *dum*, and the gerund in *do*. The other book was—let me whisper it—"Tom Cringle's Log." But, to Colin's credit be it said, he had brought it with him determined not to look at it until he had mastered his gerunds. Arnold meant work; Tom Cringle was to come afterwards as a treat and a reward, in the same way that a sugar-plum follows the swallowing of a nauseous draught.

Now gerunds in "dum," and gerunds in "do," and gerunds in general, for the matter of that, are drowsy things at the best. But it was also a drowsy kind of a place which Colin had chosen for his study. He loved it for its very retiredness. It was on the banks of a stream that meandered through a wood, a good mile from the village, and a good mile from a house of any kind, except the keeper's little cottage in the clearing.

A drowsy kind of place? Yes, for the blackbirds and thrushes that in earlier summer made wild melody in every bush and tree were silent now, the nightingale had gone away long ago, and his rival, the blackcap, had disappeared from his perch in the thorn-tree; only the linnets were left, and woodpeckers, robins, and wrens; but deep down in the darkest fir thickets cooed the cushat in mournful monotone. Then the air was filled with a drowsy chorus of insect life, flies of every genus, lazy beetles, madly-hurrying bluebottles, and bees of every "ilk and clan," some arrayed in orange and black, some radiant in purple, white, and crimson.

The day itself was a drowsy one, for it was very hot; there was not a single cloud in the grey-blue sky, and the little wind there was, though hardly strong enough to move the sturdy needles on the lofty Scottish pines, went whispering through the feathery larches, and made drowsy music among the leafy oaks.

The streamlet itself sang drowsily in the sunshine as it flowed onwards between its green overhanging banks; it sang to the big moss-covered boulders, round which it rippled; it sang to the red-ticked trouts that basked in the pebbly pools; it sang to the long, trailing, dank, dark weeds that floated on its sur-

face, and it sang to a thousand lovely wee wild flowers that bent their bonnie heads and ducked them in the pools, as if they had been instinct with life.

"Read I *must*," said Colin, half aloud; and stretching out his hand, he once more took possession of his Arnold, and began to scan its pages. But ere long the book slipped down again, and became an object of interest only to a whole lot of tiny red spiders whom their mother had brought out for an airing and to pick up some food.

The stream continued to sing, insects still hummed, the cushat crooded in the thicket, and the wind went whispering through the trees, but Colin McLeod heard them not. Nor would he have heeded them had he heard them, for now a very strange thing occurred, or rather a whole lot of strange things, for, first and foremost, not three yards from where the boy lay, a perfectly round grass-covered platform was suddenly raised, like a little woodland stage, and that is precisely what it turned out to be. Then right in the centre a kind of mist or smoke appeared, which gradually resolved itself into one of the queerest little old skinny men that ever Colin had seen in all his life. He was seated in a hard oaken arm-chair, and held a book in his hand; his face was as wrinkled as a raisin, his skin like old parchment, his lips as thin as the edges of an oyster shell, and his little dark beads of eyes winked and blinked in a way that was not at all pleasant to look at.

Something seemed to whisper and tell Colin that this was no other than the great Dr. Arnold himself.

"Now then," cried this strange being, "let the performance commence."

He had no sooner spoken, than up from the green sward rose dozens of queer comical little figures and filed past him. And every one was uglier than the other. They were humped in back, crooked in legs, and as twisted and bent and gnarled as if they had been made out of the branches of old apple-trees with the bark left on.

They were dressed in all the colours of the rainbow, and in a fashion which must have been quite antediluvian, for Colin had never seen such weird-looking coats and caps before, and inwardly hoped he never would again.

Each one passed on the grass in front of the great doctor's chair, and each one as he did so doffed his cap and bowed low and told his name. It was what man-of-war's men would call a kind of "muster by open list."

Their voices were very thin and crisp; they were more like the voices of insects than anything else. Nevertheless, Colin heard all they said.

"I'm the Gerund in 'dum,'" said one.

"And I'm the Gerund in 'do,'" said another.

"The Gerund in 'di,' by your leave," said a third.

"I'm a preterite!" cried a determined little fellow.

"I'm an active verb!" roared another, skipping past.

"I'm a preposition!" said a slower imp.

"I'm the verb 'to be!'" drawled a dandy, twirling his elfin moustache; "and I take a nominative before and a nominative after me."

"I'm alpha privite," said a very shy goblin.

"And I'm a past participle."

"I'm a conjunction."

"I'm an interjection."

And so on they went, till Colin thought they would never have done. Then they all began to dance, mingling and mixing themselves up together, and wheeling and whirling and waltzing in such an amazingly mazy, misty manner, that Colin's brain began to reel, and there is no saying what might have happened had not the awfully skinny old man in the chair suddenly raised his cane. Instant silence was the result.

"Very good—very good!" he cried. "I dismiss the class!"

Then birds flew down from the trees, and bees and butterflies came from the bushes and flowers, and in a moment or two every imp and goblin among them had mounted a steed of some kind and disappeared in the forest. Last of all, the great doctor himself went off with a bang like a sixty-four pound cannon.

Colin started up and rubbed his eyes.

"How you did startle me to be sure!" he said.

"Surely Colin McLeod isn't afraid of the sound of a gun!" said the new-comer—a strong, wiry young Highlander some sixteen summers old. I say sixteen summers in preference to sixteen years, though it means the same; but summer was indelibly fixed on the countenance of this keeper's boy. It had tanned his hands, it had burned his knees—he wore the kilt—and stained his face till his brow glowed like a marigold and his cheeks had the hue of russet apples.

When Duncan Robb laughed—which he very frequently did—he showed a set of teeth so white and so even that a queen might have envied him the possession of them.

Yes, summer was fixed indelibly on Duncan's countenance—and, let me add, sunshine on his heart. That heart of his was a very innocent one, and, as will be seen before our tale ends, a very bold and daring one.

Let me only add that he was four years older than Colin, to whom he had acted in the capacity of nurse and foster-brother ever since Colin was able to walk, and that there existed between these two lads, although born in different spheres of life, a tie of affection which few save mountaineers could fully understand.

"Afraid of the sound of a gun, Duncan!" replied Colin, his dark eyes sparkling and his face turning pink. "No, not quite; but I'm afraid I was asleep and dreaming"—here he laughed—"such a silly dream!"

"What was it? Let me hear!" cried Duncan. "Was it that all the fish had wings, and had taken to build nests in the trees, and that the hares and rabbits had taken to walking on two legs, and carrying blackthorn canes under their arms?"

"No, Duncan; worse than that. Sit down here, and I'll tell you."

Down sat Duncan, and listened very attentively indeed, while Colin related his dream.

Meanwhile there stood behind Duncan a noble-looking pure-white goat, with hair of immense length, and a beard that, tall as he was, almost touched the ground. His horns went arching over his back down almost to his loins. This was Duncan's constant companion in hills and woods; indeed, he followed him more

like a dog than anything else. But Billy, the goat, had good cause to like his young master. He had been bought when quite a kid, to be killed as soon as his hair grew long enough to make a sporran for Duncan's father. Only before this took place Billy had developed such great sagacity and affection, and looked all over so wise and old-fashioned, that Duncan begged his father to spare his life, and his life was spared accordingly. With the exception of Duncan, the only one else that Billy cared a blade of grass about was Colin McLeod, and there he stood while the boy told the dream-tale, looking as wise and as reverend as an old judge, only now and then he chewed his cud in a contemplative kind of way, and old judges do not do that.

"But I'm glad you've come, Duncan. The sun is very high up yet; suppose we have a game? There will be plenty of time for me to do my verbs after that. Have you got the dam-brod?" (Scottie, draught-board.)

"That I have!" replied Duncan, and, bringing the board out of his jacket-pocket, he unfolded it on the grass. Then he took from his sporran four good-sized carrots, and handing two to Colin, kept two for himself.

"You cut the round men," he said, "and I'll cut the square ones."

Knives were speedily at work, and in a few minutes the men were ready and the game commenced. It did not seem quite so enthralling to-day, however, to Duncan as usual, for, although by far the better player of the two, he made many ridiculous mistakes—suffered even single men to jump over and capture his crowned heads, and finally got fixed up in a corner, and so lost the battle.

"Have another?" said Colin; "there is time, you know."

"No," replied Duncan; "let us pitch the men into the burn. The fact is, my mind isn't with the play; I've been thinking all the time about something else."

"I thought I had beaten you far too easily. What were you thinking about—rabbits?"

"Rabbits!—no; I was thinking about you."

"And my silly dream?"

"Well, that began it. But I don't like your working so hard, and that old Dominie thrashing you almost every day."

"But he told my father it was all for my good, and my father said no doubt it was, and that when he was at school he was thrashed sometimes five times a day."

"But I don't believe it!" replied Duncan, sturdily; "I don't believe that all that Greek and Latin is doing you any good—nor the thrashing either. You don't get fat on it, you know. Your face is much whiter than mine, and I measure fifteen inches round the calf. Fifteen inches, Colin; and if you measure twelve, it's the most you can do."

Colin looked at his foster-brother's sturdy limbs and sun-browned hands admiringly, but did not speak.

"Now, what are you going to be," continued Duncan, "when you grow up? That is what I have been wondering all the time we have been playing draughts."

"Well, Duncan, I don't quite know. You see, my brother will be heir to the estate because he was born first, and I'll have to choose a profession."

"Ay," said Duncan, "that's the thing; there's the difficulty. You are a gentleman, and whatever you do when you grow up must be gentleman's work. As for me, you know, I suppose I shall always knock about with bag and gun, as my father did before me, and Billy here will walk behind me till his teeth fall out. That is good enough for Billy and me; but, Colin McLeod, everybody tells me you are come of one of the finest old families in Scotland, and you must keep up your name."

"Well," replied Colin, "so they say. My mother wants me to study for the Church."

"To be sure," said Duncan; "and that is what all the Latin and Greek are for."

"I suppose so; but, very dearly though I love my mother, Duncan—"

"The most perfect lady in the world!" cried Duncan, enthusiastically. "There isn't her equal in all broad Scotland, except the Queen herself!"

"Quite true," assented Colin. "But oh! Duncan, I'm not good enough ever to stand in a pulpit."

"Well," said Colin, "you are quite right, then, never to think about being a minister, for I've heard our own parson say that nobody should ever preach unless he feels he has a call for it."

"And I don't," continued Colin, musingly. "But then there is my uncle, Captain Peter, you know; he would have me be nothing else but a soldier—or rather a sailor, a real man-o'-war's-man, you know, just as he has been himself."

"That is what you *will* be!" cried Duncan; "that is what you are *born* to be. Heigho, man! poor Duncan's heart will break with sorrow the day you leave the glen. I have known and loved you all your life, and you are to me a brother—the only brother ever I had."

The tears were in good Duncan's eyes. Colin crept up closer to him and placed his arm affectionately on his shoulders.

"My dear brother," he said, "whatever betides I won't forget you, so cheer up. I feel that I am born to be a sailor, but is that any reason we should part? Couldn't you come with me? My uncle has lots of influence."

"Eh? What? How?" cried Duncan.

"Join the marines. You are strong and hardy; with my uncle's help—and your own good conduct you would soon get your promotion and be a sergeant."

Duncan laughed aloud with very joy.

"Hurrah!" he cried, "that will be splendid. Yes, I'd go like a shot. How clever you are to think of it! You've made me happy for once. Good-bye. Come on, Billy."

But the goat had lain down in the shade of some silver-birch trees, and did not seem at all inclined to stir, so off went Duncan whistling to himself but all alone.

Colin commenced his lessons again with redoubled vigour, and had soon mastered them so far as to have no fear of the coming recapitulation. Then he took up "Tom Cringle" and read a page or two, laughing as he did so.

"Yes," he said at last, "I'll be a sailor. I'm a queer boy, though; I really am afraid I'm not brave enough. All the other boys of my own age at school beat and bully me just as they please. My hands are very small, and I can't hurt them. I'll tell you," he added, speaking to himself, as if he was some one else,

"I'll tell you what I will do. I'll ask my uncle to teach me sword exercise—he offered to the other day—and then when any boy challenges me I'll say, 'Certainly, but the party challenged has the choice of weapons, and I choose sticks.'"

As he spoke he picked up a hazel switch that lay near, and commenced a vigorous onslaught upon a tall thistle that grew on the bank.

"Ha! ha! ha!" roared a voice he knew only too well; it was that of his greatest enemy; "Ha! ha! ha! what is the little boy trying to do? What is his mamma's darling about?"

The owner of this voice, which certainly was not a sweet one, sprang out of a thicket as he spoke and stood beside Colin, a great fat lout of a lad.

He laughed again, and, picking Colin's cap off with his finger and thumb, he held it for a moment high in air, then pitched it on the ground.

He next picked up the book and was about to put it in his pocket, when Colin flew at him and snatched it from his dirty hands.

"Ho! ho!" cried the lout, "ho! ho! Now, look here, my little gentleman's son. Might's right, isn't it? Well, I'm going to thrash you, then I'm going to put that book in my pocket, pitch your bonnet into the burn, and then go home to supper. Stop, I was thinking of taking my jacket off, but I won't, it isn't worth while for all the time I'll be, and you needn't take yours off either, you would feel the bats I'm going to give you if you had twenty jackets on."

Colin knew he would catch it, but he would not run, and next moment he was down on his back with his head towards the stream and his enemy kneeling over him holding him by the neck.

"Beg my pardon," he roared, tightening his grip.

"I won't, you coward," cried Colin.

But assistance came from a quarter whence it was least expected.

Billy the goat stalked out. Billy seemed to take in the situation at a glance. The lout, as I have said, was on his knees, and his back was to Billy. Billy backed astern, bent his nose for a moment to the ground, and appeared to take aim. Then he put on the steam, went ahead at full speed, and caught Colin's enemy straight in the rear, and next moment, after a hurried voyage through the air, that interesting youth found himself sitting on the opposite bank looking extremely foolish and very bewildered indeed.

Long before he had sufficiently recovered to know exactly where he was, both Colin and his friend Billy had left the wood and were homeward bound.

"Hullo, my lad!" cried Colin's uncle, who had come half a mile to meet him. "I've been looking for you all the afternoon. Glorious news for you! No such news since the fall of Sebastopol. You're going to be a sailor after all. I'm getting you a cadetship. What do you think of that, eh? You lucky young dog, you! Why, your old Uncle Peter feels quite a lad again when he looks at you."

At that moment I do not think Colin actually knew he was awake. He seemed walking on ether, his heart as light as eider down, his head up in the clouds. And Uncle Peter stumped alongside of him—he had a wooden leg—and kept up a rattling fire of joyful talk all the way home. But Colin only listened, he was

too excited to do anything else. Besides, he really half believed that if he did speak he would awake and find it was all a dream, and that he was lying beside the burn in the wood with no other companions save Arnold, the gerunds in "dum" and the gerunds in "do."

(To be continued.)

DOGS, AND HOW TO TRAIN THEM.

BY GORDON STABLES, M.D., R.N.

PART II.

TEACHING a dog to shake himself is accomplished by the same method. You see a dog when wet shaking his coat, and you say, "Good dog for shaking himself." He will soon learn what you mean, and do it at any time to order. This is a useful trick. On a wet day no favourite dog of mine is allowed to enter even the kitchen until he has shaken the rain-drops out of his jacket.

But if I order any of my dogs in a quick, sharp tone of voice to shake himself, as often as not he will make a bow instead, and I will have to repeat my words of command slowly and distinctly. This only proves how nervous a dog is, and how easily confused.

Another easily-taught and useful accomplishment is opening a door with nose or paw, and shutting the same when told to do it. I need hardly explain how this trick is taught; it is so simple that the method will suggest itself to any boy who possesses common sense.

Fetching and Carrying.—These are useful acquirements, and easily taught. But there must be a perfect understanding between dog and master to begin with, and the usual amount of affection. The first lessons are always given during a game of romps, with a ball, a stick, or—as good as either—an old boot. Throw the thing, whatever it is, and get him to run after it; then when he has seized it call him towards you, take it from him gently, and throw it again, giving him a reward when he deserves it. Then change ground when you call him, and he will speedily learn to follow you long distances with the article in his mouth. But observe—make him believe that you put considerable store by the ball or the old boot, and when he finally carries it home put it carefully away, letting him see you do this. Use the same thing every day for a week or two, then you may change it.

The next stage in the fetch-and-carry lesson is to place the article on the ground and teach him to bring it to you only when you say, "Now, go fetch!" You may put it down thus, and then lead him away by the collar—(N.B. Never lead a dog by the ear)—for some distance, and, quitting hold of him, cry, "Now, fetch it, boy!" Or make him keep close to heel by finger-motion until you give the word—which he will be intently watching for—to "Go fetch!"

You may afterwards gradually increase the weight of the article he has to carry; and so, if he has been previously taught to "keep to heel," he will soon become a very handy and useful light porter.

This keeping to heel is easily taught, partly by words, partly by the action of pointing behind you. The words must be uttered firmly, but not too much so or you will "cow" the dog, and a "cowed" dog is better dead, for his own sake as well as for his master's.

Immediately after he has been taught to fetch and carry you may teach him to ring a bell. This can be done in about three lessons. He will pull hard at first, as he naturally thinks he is expected to fetch the bell-pull right off; but if you say quickly, and in a pleased tone of voice, "Good dog," as soon as the bell rings, and give him a tit-bit, he will

let go the rope and run to you for the reward. That is how that trick is taught.

Following the fetch-and-carry drill come lessons in swimming. Throw the stick he carries into very shallow water at first, and do not risk his going beyond his depth until he is quite at home in splashing about. I do not mean risk of drowning, but risk of giving him a fright and making him water-shy. Never force a dog into the water.

One dog who can swim well will encourage another to learn.

Teach a dog diving by throwing into the water—which must not be deep at first—some article that will sink very slowly, and that can be seen at the bottom.

Another accomplishment a good water-dog should be taught, is that of taking the water with a spring; and still another, that of leaping from a height. This is a mere matter of gradation, but takes some time to acquire. Teach him first to jump off the bank of a stream. When he has completely mastered the art of springing with his fore-feet thrown well out, and his chin high in air, then you can increase the height from which he leaps, till finally he will jump from a high bridge as easily and willingly as from a low bank.

Jumping from a boat in motion would be the next step in his water-training. In this case never attempt to force him. Only you may excite him by pretending to throw the stick several times before it actually parts from your hand. Having worked him up to the proper pitch of enthusiasm, let the stick fly, and ten to one he will go after it. Then wait for him, and help him up into the boat.

Never put the dog into a very rough sea unless he be very accomplished indeed.

Never allow him to jump from a height without the word of command, or some day you may see him drowned or run down by a steamboat before your eyes.

Never put him into a strong river current, or into water of any kind, without first making sure that he can get easily out again.

One of the most useful of all accomplishments that can be taught to a water-dog is that of taking a piece of stick or wood with a line attached to it out to a boat or vessel some distance from the shore.

It takes time to teach this, and only Newfoundlanders need acquire the art, which, however, having once learned they never forget.

Two people are required as teachers, and there are several plans or methods of teaching adopted. Here is a good one. Suppose that you are the master of the Newfoundland, and he is already an accomplished swimmer and good water-dog; well, you must have the animal in a boat with you, your friend being on shore. Get some one to row the boat within easy distance of the beach or bank. Now, take the dog's favourite stick, and, after showing it to him several times, throw it right on shore. Your friend will be there ready to fasten on a piece of line to it, and as soon as the dog lands he must have the stick given to him and be told to "Hie off, boy!" which he will readily do. If he goes to the boat without the stick the master must look disappointed, and say, "Where is the stick, boy? Hie away and fetch it!" When he comes on board with it he is to be caressed and rewarded, and the same performance gone through over and over again.

He will soon get quite *au fait* at this sort

of work, and will not refuse to take a stick with a line by-and-by to any boat that is pointed out to him. But your friend should be in that boat first—not a stranger—and you yourself on shore.

Saving life usually comes natural to all well-bred Newfoundlands. When it does not it may be taught by getting up a dummy man and having it thrown overboard from a boat in the dog's full view, the dog and his master being both on shore.

Teaching dogs to stand on the hind-legs is easily done. It must be a small animal, and a poodle is best, because he has a better power of balancing himself. He must be put up in a corner first and commanded somewhat gruffly even not to move while you hold your finger up, but when he has come down he must at once be praised, patted, and have a tit-bit.

It is best to have the tit-bit ready in your hand so that he can see it.

When he has fairly mastered standing in a corner, he is next and in the same way to be taught to stand on his hind-legs in the middle of the floor, and having become an adept at this trick, hold up the tit-bit, and he will soon learn to walk a little way for it, and in time will be able to walk a hundred yards at least.

When standing, you can with care, and giving him many injunctions not to move, put a little hat on his head and a pipe in his mouth, or you can give him a miniature pike or sword or toy gun. In fact, there is no end to the funny things that a dog who can walk may be made to perform.

Here is one. Place two chairs back to back about a foot apart. Now teach your little dog to stand on these chairs, his hind-legs on the back of one, his fore-legs on the back of the other. When he is perfect at this, while he is still in position, gradually draw the chairs asunder, and you will finally find him spread out like a hunter at the gallop or a dead hare on a market stand.

The words to use for these tricks are, "Up!" "Good dog!" "Steady!" "Walk!" "Don't move!" etc.

Teaching a dog to jump through a hoop is easy enough, and large dogs will do the trick. I make a little barricade for them first, and, going to first one side, then the other, call them, and they jump easily. Then you can, instead of going over yourself, merely stand "stride-legs" across and hold your head to the side you want the dog to jump to. After a few of these lessons and the usual rewards he will jump first over a stick held out to him, then over half a wooden hoop, and finally through a complete one. When he is perfect at this exercise you can cover your hoop with thin rag, wet it with spirits of wine, and set fire to it; he will leap through it just the same. Or you can gradually cover up the hoop with thin paper till you get him to dash through it when all covered, as riders do at a circus.

The tricks of begging, giving a paw, snapping things from the nose, etc., are all too well known to need description.

Begin teaching a dog at six months, not earlier, and let him learn one trick pretty well before you begin him with another.

I think now I have said enough to show you the general principles on which dogs are taught tricks and accomplishments, and everything I have told you is practical.

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

II.—FISHING WITH THE NATURAL FLY.

DO not suppose that many of my readers know what a blow-line is. Let me at the onset explain. Briefly, then, as its name implies, it is a line supported and mainly manipulated by the

agency of the wind. Premising this much, I will detail the whole tackle, commencing with the rod. This weapon should be of light material, such as mottled cane or bamboo, and of not less than, say, sixteen feet in length. It should be of a tolerably stiff make, and its rings of solid brass or steel not overlarge. The reel may be of the ordinary oxydised or bronzed brass click pattern, and should be large and weighty enough to *balance the rod in the hand*. Perhaps this requires a little explanation. If a rod be properly made—that is,

tapered with the mathematical exactness which alone will ensure satisfactory and pleasurable wear—its weight in the hand appears to be considerably less than its actual dead weight really amounts to. This is due to a cause somewhat similar to that which accounts for a good rider in the hunting-field burthening his horse some pounds less than he would do if a bad mount or inert in the saddle. Hence also the necessity for a sufficiently weighty reel. If this be too heavy it will tire one's arms unmercifully, and if too light the rod will tire one, and the additional annoyance of uncertainty in striking one's fish accompanies the evil. Care, therefore, is in a word highly necessary in the selection of the rod and reel in "blow-line" as in other kinds of fishing.

The rod and reel being duly chosen, the "blow-line" itself next demands attention. This consists of the finest of floss or unwoven silk. There is but little twist in it and no plait, and it must be of the purest silk, or the fibres rapidly separate and break, and so the blow-line rapidly becomes unusable.

As a rule not more than twenty-five yards are required, and these are carefully wound on the winch outside an ordinary silk line, to which it may be attached. The bottom line consists of the finest gut and a

hook of No. 6 size. I like the sneak-bend pattern best. Thus the angler has his equipment for blow-line fishing.

Now for the *modus operandi*. The season is chiefly early summer, continuing on to its full meridian and decline. Whether for trout, or dace, or chub, this style of fishing is equally delightful and effective. On a hot day, for example, when now and then the gentlest of breezes ruffles the surface of the water, and when its shallows are so diaphanous as to reveal the glistening gravel to its uttermost pebble, and when assuredly the keen-eyed trout would instantly detect the "counterfeit presentment" of a fly—then is the season for the natural bait. The weather is possibly too hot to be pleasant for the active piscator casting unceasingly. Moreover, Piscator perhaps desires an occasional surcease without winding in his line, which, with the blow-line tackle, he has to accomplish only by sticking the spike of his rod in the bank, allowing his line and bait to blow in mid-air where-soever it listeth. Or in the even-time, when the trout or dace are on the shallows, and a zephyr-like wind is caressing the rippling water, when the limbs of the angler are tired, perchance, and he himself prefers the *dolce far niente* to energetic action, how pleasant it is to stroll along the bank and to basket such fish as the river-god sends for his breakfast-table.

"But how does one use this kind of tackle?" I hear the practical reader complain, tired with my digressions. In this wise, oh! impatient one. First secure your bait. The alder, May, and cinnamon flies are all available, but not always to hand. There is, however, one species of insect that is generally within reach. Know you not the noisy, bouncing denizen of slaughter-houses, the frequenter of odorous and pestiferous shambles, the spoiler and devourer of our meats, and yet without the possessor of a gem-like coat of mail and wings of sheeny gauze? Know you not the loud-singing bluebottle fly? That is the bait which for all-round purposes is most useful. Trout will but rarely refuse to take it.

It is not very easy to catch the bluebottle except with the net. It is to be found during sunny still days in spring bustling around and in and out of the thick-leaved solitudes of an ivy-covered house, or in and amongst the leaves of the yew-tree. As I now write I could catch hundreds from the ivy covering my house. Then of course there is your butcher's slaughter-house, and if you do not like going there yourself it is easy enough to offer a reward of a penny a dozen, or even less. Having obtained a sufficient quantity, or even less, kill such as are alive by means of the ordinary ammonia-bottle or other convenient means, but do not mutilate them whatever you do. Place them then in a dry and sheltered place, that the viscera, and indeed all the contents of the body, may dry, leaving only a mere shell. A few days, if the weather be warm, will accomplish this; and then, with deft fingers, tie a thread of sewing-silk round the centre of each fly. I advise the angler to do a dozen or two, and he can carry them with him in a little tin box.

On reaching the water the blow-line fisher must ascertain the direction of the wind first. Of course, as will be seen, he must so arrange his position with regard to the water that the wind may be at his back. On some days the wind therefore being adverse, it is impossible to use the blow-line. However, we will for the nonce imagine that the wind is gently blowing up stream. Piscator proceeds to adjust his tackle. Taking the hook before mentioned, he places it between the back of the bait and the silk which encircles it. The hook is thus free when a fish takes the bait, and much more likely to catch hold than if it were embedded in the body of the bait. All being ready, the rod is raised aloft, and the line, soft as gossamer, paid out. Floating before the wind, the bait probably arrives at a point twenty yards away from the angler before the latter deems it advisable to lower his rod's point and allow it to touch the water. Carefully now by the governance of the wind he allows it to wander along the surface. Now it flies carried by the wind, and again descends as softly as a snowflake to again skip off a few yards and then to skim along with most enticing movement. The watching trout notes the occasional disappearance with disappointment, but, lo! with most natural fall it comes again just before the fish's nose. With unhesitating impetuosity he is upon it, and presently finds himself reposing in the creel of the blow-line fisherman.

There is one species of accident which may occur to the angler employing this method, and that is the capture of swallows instead of fish. This is an occasional source of annoyance, not to mention the regret one must feel for the luckless bird. I recollect an incident that once occurred to me which will bear out this. I had been fishing long and had grown tired—arm-weary. At last I stuck the spike of the rod in the ground, and allowed the line to play before the wind. Suddenly a terrific jerk wrenched the rod from its position, and, snapping the top joint, carried away about twenty yards of my floss-silk line. This had been done by a swift-fly swallow without doubt, but where, and oh! where could it be? Two days afterwards I was rowing down stream in the neighbourhood, and, seeing something like a white line depending from a bush, I approached, and,

to my surprise, found it was mine, lost the evening or two previous. It was wound in and out with labyrinthine folds, reminding one of the historic silk clue of fair Rosamond memory. It did not lead to anything fairer, however, than a poor little dead swallow with a hook lodged in its crop.

Well do I remember my first lesson in this style of fishing, and this recollection probably invests it with a "dearness not its due." When quite a small boy of seven or eight I had the good fortune to attract the notice of a veteran angler, an old retired gentleman living near my home at Chertsey on the Thames. Alas! poor old gentleman! he has gone over long since to the "rest that remaineth," after suffering greatly. But I can sit back in my chair and, closing my eyes, recall as from yesterday that special evening when on Chertsey Mead he put his rod into my hands, and I caught my first dace with the blow-line. The shallows in the clear summer weather were multitudinously peopled by roach and dace, and I remember the delicious gloaming on the stream, and the deepening twilight on the dark plumes of the pines on Woburn Hill behind. I can hear the whirring call of the landrail, now near and then afar, and the twittering of the sedge-warbler as it trips from reed to reed. Bright over all rises the evening star over the expansive Shepperton Range, where our savage forefathers waged mighty strife against the Roman hordes. I can in fancy hear the gruff and kindly tones of warning and counsel as I hook my first fish, and can feel the congratulatory pat on my back as my master lands and shows to view the gleaming sides of a fine half-pound dace. Ah me! the golden days of boyhood! make the best and truest use of them, my friends.

A modification of this style of blow-line fishing is sometimes made use of on the Hampshire rivers during the rise of the Mayfly. On a winding stream there are of course points which the wind will not allow to be fished with the blow-line as ordinarily used. To get over this difficulty two persons fish with one bait in this wise. One stands on one side, and the other on the other, opposite each other; they both have rods and lines, and their lines are drawn out

and joined, as shown in the following diagram:—

A A are the two rods at opposite sides of the stream, B B are the two lines, and C indicates the hook-line. It is obvious now that with very little difficulty the C line can be worked all over the stream by either of the rods letting go or winding in fresh line, as may be necessary. Of course I need scarcely say that neither of the rodsters must persist entirely in having his own way, or a dissolution of partnership will inevitably ensue. The wind is of course supposed to blow in the direction indicated by the arrow.

Another killing way of fishing with the natural fly, or indeed with any natural insect, especially with cockroaches and cockchafers, is that termed dipping or dapping. A short thick rod is necessary for this and strong gut. The line is wound round and round the top of the rod, and this is introduced through any overhanging bushes which may be known to overshadow the haunts of trout. Some of the finest fish lie perdue in such otherwise inaccessible localities. After the point of the rod and the baited hook is thus over the water, the line is uncoiled and the bait gently let down on the surface. A gentle dapping motion is then imparted to it, and ten chances to one but you will get a fish during the first few minutes. You must be firm with him and not allow much grace, or, strong as is your tackle, the probabilities are he will break away. A worm is sometimes employed in a similar way, but its use, as that of the natural fly entirely, is not looked upon as sportsmanlike on many rivers, the artificial fly being alone countenanced.

(To be continued.)

A SILENT WITNESS.

By SOMERVILLE GIBNEY.

CHAPTER I.

move at Langton School. The examination for the Field Mathematical Medal was shortly to take place, and this quarter it was remarkable what a number of good mathematicians the Remove contained, and how nearly equal many of them were.

For it must be remembered that the boys took their positions in the school according to their ability in classics, mathematics being looked upon as a secondary study. This being so, it often happened that, though a form was rich in classical scholars, it possessed only one or two fair mathematicians. But, as I have stated, during this quarter the Remove was strong in mathematics.

Sir John Field was an old Langton boy, and, as the story went, had at one period of his life lost a considerable amount of money through some errors in his calculations, and he therefore founded a series of annual medals, one for each form in the school, to induce a deeper study of that science, ignorance of which had cost him so dear. He himself settled the condi-

tions and the manner of the examination, which varied with each form.

In the case of the Remove there were papers on arithmetic, algebra, and Euclid, on separate days, two hours and a half being allowed for each paper. Then there was *viva voce* Euclid, and added to these a paper of problems on the first three books of Euclid. This paper consisted of problems or deductions to be worked out by means of the propositions, and was a fair test of whether the boys were able to make use of the learning they were supposed to have gained.

This paper was given out some time before the days fixed for the rest of the examination, and was to be done at leisure times, the boys only being put on their honour not to receive help from any one.

It was half-past nine, supper was over, and the boys in the head master Dr. Marsdon's house were supposed to be deep in their books. One of them, Ernest MacVicar, certainly was. Seated alone in his room, with a sheet of paper in front of him covered with circles, lines, and angles, over which he was poring, his hands pressed to his head, and his elbows resting on the table. There was no mistaking the fact; he was hard at work.

THERE was a good deal of suppressed excitement hanging about the Re-

His face was not a clever one by any means, but there was a look of dogged perseverance that went far to make up for a lack of brilliancy.

The door opened, and a boy entered, the very opposite of MacVicar. There was no want of sharpness in the countenance of Dyer. A glance would tell you he was clever, but at the same time you would probably admit that there was a something you did not quite like. You might not be able to describe it exactly, but it was there all the same.

"Oh, I say, Mac, I want you to lend me your 'dic.' for a bit, I can't find mine anywhere. I fancy I must have left it in the grub-shop coming down from fourth school."

"I never saw such a fellow as you are, Dyer. You never seem to have a book of your own. Yes, you may take it; I've done my Homer. But let me have it back to-morrow first thing."

"Done your Homer? Lucky dog! I wish I had. Then what are you 'swotting' at there?"

Just then the silence of the house was broken by the cry of "B—o—y!" drawled out to an abnormal length.

"Bother it!" exclaimed MacVicar, rising. "There's Bidder calling. What on earth does he want?"

"What? Are you on night fag this week?"

"Yes," replied MacVicar, leaving the room.

"Well, tell us where I shall find the 'dic.' before you go. I can't wait for you coming back. I haven't half done my 'con.' yet."

"At the end of the third shelf from the top," came the answer from half way down the passage.

"Never saw such a fellow to grind as Mac is," said Dyer to himself, as he got out the dictionary. "I wonder what he's on to-night. The problems, as I live, and the very one I'm stumped over. Let's have a look."

For the next minute or two Dyer examined the figures closely, and then, with a low whistle, said,

"He's got it. He's as right as the mail; but I don't fancy he sees it. Pity his labour should be thrown away, it will be useful to me. Where's a bit of paper? Won't do to take any of his." Then feeling in his pocket, "Ah! here's Will's letter. I can use the back of that." And seizing a pencil, he rapidly copied one of the numerous figures from the paper before him.

He had not quite finished when he heard MacVicar's returning footsteps, and laying down his pencil, he thrust the paper into his pocket, and seizing the dictionary, seated himself beside the fire, pretending to be looking out a word.

"Hullo, Dyer; not gone yet?"

"No; you've got such a jolly fire, it tempted me, and I stayed."

"You've not been 'cadging' my work, I hope?"

"What work?" replied Dyer, looking up with well-feigned surprise.

"These problems. There's one here I've very nearly proved, but I can't make it quite come out clear."

"You young mug! Do you think I can't do my problems without sucking *your* brains? I'm not quite such a duffer as all that."

"All right, all right; don't get in a wax. But clear out, there's a good fellow, and take the 'dic.' with you, I can't get on when you're here."

"I'm off. Good-night. I'll let you have it back in the morning." And pulling the door behind him, Dyer left the room.

MacVicar was an unsuspecting boy, and was quite satisfied with Dyer's answer. Thinking no more about the matter, he was soon deep again in the problem.

(To be continued.)

THE CRICKET SEASONS OF 1884 AND 1885.

HAVING devoted so much space to the doings of the Australians in our part for last November, we can resume our yearly review with a clear field as far as they are concerned, and start at once with the ordinary first-class matches.

County cricket in 1884 was noteworthy for its having left no doubt as to which was the best and which was the worst of the teams. The usual warfare as to the claim to be champion county vanishes when Notts wins nine matches out of ten and draws the tenth favourably; and there can be no question as to which is the worst record when Derbyshire plays ten matches and loses every one of them. The top and tail of the list are thus afforded without fear of dispute; the intermediate places are not so easily assigned. Taking the losses as our guide, in the usual fashion, the order of success runs—Notts, Middlesex, Yorkshire, Surrey, Lancashire, Sussex, Kent, Gloucestershire, and Derbyshire. Considering only the number of wins, the order becomes—Notts, Yorkshire, Surrey, Sussex, Lancashire, Middlesex, Kent, Gloucestershire, and Derbyshire. Considering only the number of runs obtained per wicket, on the principle that some reformers affect, we get Notts, Middlesex, Surrey, Yorkshire, Sussex, Lancashire, Gloucestershire, Kent, and Derbyshire.

Thanks in a great measure to the astute captaincy of Alfred Shaw, the Notts record was the most brilliant the county has yet achieved. Owing to the great bowling controversy there were no matches with Lancashire, but the county of the red rose would not have had the slightest chance with such a thoroughly good all-round team. Morley's illness—which ended in his death at the close of the season—deprived the county of one of its best bowlers, but his place was ably filled by Attewell, whose advance brought him into the very front rank. If Attewell improved as a bowler, Scotton improved as a batsman, and he has now the reputation of being the stubbornest of the left-handers. In 1883 his county average was 15, in 1884 it was 34—a sufficiently great improvement. Shrewsbury, however, thanks to his 209 at Brighton, when he and Gunn put on 266 runs before they were parted, has the best average. Shaw was the best bowler, his best performance having been in the Gloucestershire match, when the Graces were standing out owing to the death of their mother; he then accomplished the hat trick in each innings, and took fourteen wickets for 65 runs! The Notts matches were with Middlesex, Surrey, Sussex, Yorkshire, and Gloucestershire; this year the same programme will be entered upon.

Yorkshire, led by Hall, won eight matches out of sixteen, the failures being four in number, and comprising the two Notts fixtures and the out match with Sussex and the home match with Lancashire. The captain was well in front of his men in the batting averages, thanks to his three scores of over a hundred against Kent, Sussex, and Middlesex. Emmett's release from the captaincy enabled him to take his full share of the bowling, and a remarkably successful return was the result. Peate and Ulyett were also in true form, the latter retaining his position as the best fast bowler in England. As usual, the most exciting match of the year took place at Bramall Lane against Notts, the southern county going in to make 53 runs, and losing six wickets for 32. To those who have never seen the enthusiasm that cricket can evoke amongst spectators, a visit to Bramall Lane or Trent Bridge when these famous shires are matched against each other is an event to be remembered. This year the fixture at Sheffield is fixed for June 29th, the return coming off at Nottingham on July 13th.

The Middlesex team of 1885 will be con-

spicuous by the absence of Mr. I. D. Walker, who retires from the captaincy he has held so long in favour of Mr. A. J. Webbe. It also loses Mr. C. T. Studd, who has gone out to China as a missionary, his companion being the late stroke-oar of the Cambridge eight. The lesson of the 1884 record is that which has been taught us over and over again—that a strong batting side is not necessarily a winning one. Middlesex, under the residential clause of county qualification, has the metropolis to choose from for recruits, and one of the mysteries of modern cricket is why, with such advantages, the record should always be so disappointing. The feature of the past year was the brilliant scoring of Mr. T. C. O'Brien, who made his hundred in each of the Gloucestershire matches.

Surrey is elbowing its way to the top again after a prolonged eclipse, and the results of the last season were very cheering. Mr. Horner's bowling and Mr. Read's batting proved invaluable. The policy of playing second-class counties, to afford a sufficiency of practice matches to drill the team together, is to be continued this year, and the Surrey card is a very full one. The Bank Holiday match at the Oval is to be against Notts, and the contest will be more than usually interesting. Last year 10,500 persons paid to see this match, and it was the only one in which the Notts career of victory was checked, Surrey beginning brilliantly and securing a draw. With the same captain, Mr. Shuter, and with the best of the old choices and some of the younger ones like Lohmann and Wood, Surrey in 1885 promises to be very strong.

Lancashire is descending from its high estate, but the decay is only temporary. Although its amateurs are ageing and not always available, and its professionals are falling off, yet the opening afforded by the residential clause for the infusion of new blood, which has been taken advantage of to such good purpose hitherto, is not likely to be neglected in the future. At the same time there can be no doubt that were the Lancashire players of Lancashire birth their deeds would be watched with more interest. The men of Notts may be pardoned at feeling a little sore when—to say nothing of style—their wickets are shattered by Crossland and their chances of runs are promptly nipped in the bud by Briggs; and on grounds in other counties we can sympathise with the wonder occasionally expressed when Lancashire is in the field at finding a Scotchman bowling, a Bedfordshire man at the wicket, an Oxfordshire man at slip, and a Yorkshireman at long-on. Five matches won out of ten was the record for 1884, the victories being over Kent, Surrey, Yorkshire, and two over unfortunate Derbyshire. It is a curious fact that Kent, Surrey, and Yorkshire each succeeded in defeating Lancashire on Lancashire grounds, the fourth match lost being that against Gloucestershire at Clifton. Among the noteworthy events of the season was the pleasant act of sympathetic courtesy by which the Gloucestershire match was abandoned at Manchester on the receipt of the news of the death of the mother of the Graces. Last year Lancashire added to its engagements by playing Cheshire and Somerset; this year they will play Cheshire and Essex.

Sussex, like Surrey, is coming to the front again, and the glories of the last generation have some chance of being repeated—thanks in a great measure to the liberality of Lord Sheffield, whose cricket subscription of £250 per year "for the good of the game" is worthy of note as a best on record. In Mr. Whitfield the patient—in the Surrey match at the Oval he was in for three hours and a quarter, having carried his bat through for 41—the county found an excellent captain, and in the two old Ardingly boys Messrs. Newham and Blackman, and Humphreys and Jesse Hide, it had and has four of the best men in England. Last year the team won six matches out of twelve, drawing only one,

and losing the Huddersfield match with Yorkshire and the brace of matches with both Notts and Surrey. The feature of the season was the moral victory over the Australians, to which we can only allude to note that the 396 is the largest innings total as yet made by a county against a colonial team.

(To be continued.)

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Writing Competition.

(Continued from page 432.)

MIDDLE SUBDIVISION (ages 14 to 16).

Extra Prize—10s 6d.

WILLIAM MORBY (aged 14), Kimsbury House, Upton, St. Leonards, Gloucestershire.

Certificates.

EDWD. A. DEARLE, Bearwood Hill Road, Burton-on-Trent.

THOS. G. MCARTHUR, Bonfield-by-Paisley.

FREDK. C. WOODLIFFE, 29, Brooklands Terrace, Swansea.

EDMUND W. ADAMS, 43, Thornhill Road, Barnsbury, N.

ARTHUR BROWN, 68, St. Giles Plain, Norwich.

JAMES E. GAUNT, Holly Mount College, Tottington, Bury.

HERBERT E. HOPKINS, 137, Petherton Road, Highbury New Park, N.

JOE NAYLOR, 13, Brae Street, Liverpool.

J. W. K. VERREN, Minehead, Somerset.

FRANK CHAPPELL, Eastover, Bridgwater.

EDWD. WILLIAMS, 91, Anthony Street, Everton, Liverpool.

CHARLES J. ANTHONY, St. Faith's Cottage, St. Faith's Lane, Norwich.

THOMAS BULLIVANT, 58, Abbey Street, Derby.

CHRISTIAN H. MILNE, 58, Rose Street, Aberdeen.

CARL SCHAEFER, 26, Piazza Maggiore Floriana, Malta.

RICHARD S. VARLEY, 119, Carter Street, Greenheys, Manchester.

JOHN FRENCH, Rosslyn House, Richmond Road, Barnet, N.

JOHN A. COOPER, 97, Goodramgate, York.

W. C. HOWLAND, 3, Mount Pleasant Road, Lewisham, Kent.

EDWIN M. STEVENS, 220, Kentish Town Road, N.W.

W. G. COLES, 9, Chaldon Road, Crown Road, Fulham, London.

CLEMENT WILCOCK, Westbourne House, Thirsk, Yorkshire.

S. TURNER, 31, Grosvenor Road, Highbury New Park.

JAMES S. COOPER, 1, Buckland Terrace, Plymouth.

JAMES P. PHASEY, 44, Johnson Street, Cheetham, Manchester.

DAVID C. ROBINSON, 25, Charlton Terrace, Grimsby.

HENRY MACKNEY, 57, Great Queen Street, Dartford, Kent.

WILLIAM R. GLARE, 45, Cardigan Road, Bow, E.

CHARLES W. SMITH, 84, Burleigh Road South, Liverpool.

JAMES W. RICHARDS, 14, Anson Road, Tufnell Park, N.

CHARLES H. CHANDLER, Basing, Basingstoke, Hants.

PETER GARDNER, 296, South Cumberland Street, Glasgow.

CHARLES F. FULLBROOK, 157, High Street, Hounslow.

WILLIAM G. GALLEY, 5, Guelph Terrace, Albert Road, Walthamstow.

ANDREW W. CLARKE, 65, Arundel Street, Liverpool.

ALFRED L. PEPIN, Le Ponterrin, St. Saviour's, Jersey.

WILLIAM C. RUSSELL, 9, Morpeth Road, South Hackney.

OWEN HILL, King Street, Lostwithiel, Cornwall.

GEORGE W. WILCOX, 37, St. Mary's Street, Southampton, Hants.

PERCY H. WILLIAMS, 11, High Street, Barnstaple, North Devon.

CHARLES R. BOWN, Victoria Terrace, Cromford, Derby.

ROBERT W. LISLE, 69, Pine Street, Scotswood Road, Newcastle-on-Tyne.

A. W. O. PAIN, 3, Sidney Street, Cambridge.

EDGAR J. TURNER, 12, St. Stephen's Road, Burman-tofts, Leeds.

FRANK H. GRIFFIN, 35, Devonshire Road, Hackney.

EDWARD E. JAMES, 7, Cambridge Terrace, Regent's Park, N.W.

ERIC W. WEST, Camden Lodge, Belvedere, Kent.

CHRISTOPHER WILLSON, Dudley House, Ramsgate.

WILLIAM F. DIGGORY, Wilton Lodge, Wergs Road, Wolverhampton.

FRANCIS W. DARCH, 36, Gedling Street, Dockhead, S.E.

ARCHIBALD MCLAY, Barnsdale Street, Ninians, Stirling.

FREDERICK W. WILTSHIRE, 36, Warwick Street, Deptford, S.E.

JOHN RAE, 62, Union Street, Aberdeen, N.B.

ERNEST C. BRIDGES, 4, King's Road, Southsea, Hants.

WILLIAM KEAVENY, 2, Ratcliffe Street, Duddeston Mill Road, Birmingham.

THOMAS F. LAYMAN, Paul Churchtown Board School, near Penzance, Cornwall.

H. J. RYLAND, Providence Street, Earlsdon, near Coventry, Warwickshire.

CHARLES A. TOWLER, Wortley, near Sheffield.

CHARLES A. HOOPER, Eastington Lodge, near Stonehouse, Gloucestershire.

HERBERT DANDO, Dixon's Green, Dudley.

WILLIAM RUDD, 23, Factory Square, Great Yarmouth.

GEORGE W. HOYLE, 110, Westleigh Lane, Westleigh, Lancashire.

THOMAS E. HAYMAN, 46, Talliour Road, Peckham, London.

WILLIAM H. FEARIS, 8, Seymour Street South, Denton, near Manchester.

JOHN SHEPHERD, 170, Fox Street, Pitsmoor, Sheffield.

PERCY BALMFORD, care of Mr. Isaac Balmford, Longwood, near Huddersfield.

ARTHUR J. BENSTED, Harold Road, Waltham Abbey, Essex.

J. DAVIDSON BOGIE, 8, Causewayside, Edinburgh.

CHARLES J. JONES, 2, Cross Hill, Shrewsbury.

WILLIAM PERCY NEATE, Pewsey, Wilts.

WILLIAM BOYD, 22, Linthouse, Govan, Glasgow.

HENRY E. HIBBERT, 4, Stone Villas, Knight's Hill, Lower Norwood.

ALFRED E. BIRD, 13, Henrietta Villas, Bath.

WILLIAM J. MCWILLIAMS, Royal Academical Institution, Belfast.

FREDERICK O'NEILL, Royal Academical Institution, Belfast.

A. J. MCDIARMID, 19, High Street, Deal.

PERCY BLACKALLER, Flyderville, St. Nicholas Road, Upper Tooting, Surrey.

PERCY F. RUFF, care of Mr. Bocking, Groombridge, near Tunbridge Wells, Sussex.

Correspondence.

LORA A. BRILL.—You almost deserve to lose your goldfish, and the poor thing would be better dead. He ought to have fresh water every fortnight in winter, and once a week or oftener in summer, and have regular attention in every way. You are an example of those young folks who invest in pets without ever troubling their heads to study the habits and requirements of the poor creatures they purchase. It is not *now* you should be asking anything about how to keep goldfish in good health; you should have learned that long ago.

ZULU.—"Six toes on a cat" is merely a freak of nature.

TRANTABOGUS.—Your rabbits are suffering from diarrhoea. Give more hay and less green food; remove to a clean hutch and keep them as sweet as possible. It is nearly always the fault of the owner when rabbits are ill.

COLUMBA.—Yes; why not? Price of a pair of good tumblers from five shillings.

BLENNHEIM.—Too late now to tell you about stuffing a skin; we go to press some weeks before the date of publication. Boys who have dogs sick will please note this answer.

VERO C. PALIM.—To answer all your questions would take two columns of our valuable space; pray be modest, and give others a chance. Get the back numbers containing our Pigeon series.

H. MENZIES.—Put a few drops of paregoric in its fresh drinking-water every day, and just feed as you are doing. The warm weather *may* cure it; if not, nothing can.

A. DUMBELL.—You might keep rabbits in your shed, but you won't keep them in health unless they have a run as well. All creatures must have fresh air and exercise, with plenty of sunshine.

FLY.—You will find a good description of fly-fishing in Derbyshire in "An Amateur Angler's Days in Dove-dale," published by Sampson Low and Co., price one shilling.

M.—The "Kriegspiel" is a highly complicated technical game for two players and many umpires, on which a descriptive manual has been published, which you can procure from any military bookseller. It is devised to represent the incidents of warfare, and is played as an exercise in strategy.

THOS. C. DART.—The insect you send is a beetle named *Mezium sulcatum*, generally found in houses, etc. Are you quite sure that it came from the flowers and seaweed you mention?

F. F. MAHON.—Your butterflies are—(1) *Purarga megara*; (2) *P. Ageria*, both of them common species.

F. HARDING.—Certain butterflies are apt to become greasy, although seldom to the same extent as is the case with many moths. We have often seen greasy *Vanessas*, for instance, and now and then a *Fritillaria* in like condition.

SOADY, W. H.—Such things are bought at any toyshop. To make a powerful spring pea-shooter, procure a piece of crinoline steel.

LEG BEFORE.—To keep the bat in condition give it a good cleaning once a month with raw linseed oil. See the article in the fifth volume on "The Cricket Bat, and how to use it," by Dr. W. G. Grace.

R. O. C.—Ivory for the keys of harmoniums and other musical sundries you can get from Mr. Dawkins, 17, Charterhouse Street, Holborn.

MAKER.—Of graph compositions there are scores. Here is one. Soak two ounces of Russian glue in four ounces of water till they are absorbed. Melt them over a fire, but do not let them boil. When melted add to the solution eight ounces of glycerine and five drops of carbolic acid, and mix it up with Paris whiting until it is as thick as cream. For ink use Judson's dyes.

MAORI.—1. You can take the verses from our Christmas and Summer Numbers, or any of our publications, but you must state whence you quote them. 2. You can give a separate setting for each verse if you choose, but there is no need for you to do so. Please yourself.

A. G. J.—The regiments of volunteers differ in their regulations as to uniform. It is, however, better to get your own.

JACK CHARTERS.—Buy a quarterly Navy List from Mr. John Murray, Albemarle Street, or any military or naval bookseller, and consult the regulations as to naval admissions for yourself.

ICH DIEN.—The passage appears in a book avowedly written for a party purpose; and as it is a question of the word of a spiteful woman against that of the Duke of Wellington and the majority of the nation, we prefer to think that the Iron Duke did not expose his troops to more dangers than necessary, and did win the battle of Waterloo on his merits. If it comes to mushrooms—dukes or otherwise—who was Lady Hamilton?

HORATIO.—In our mind's eye, Horatio, you had best apply to him who gave the information. He may, perhaps, be pleased to put down forty pounds for that for which another man would give but two-and-sixpence. Such random estimates do much mischief, and oft recoil on those who venture them.

H. H. WELLS.—Canary perches should be about a quarter of an inch in diameter.

ENGINE.—You can buy crucibles from the chemical appliance sellers. Try Townson and Mercer, of Bishopsgate Street; or Griffin, of Long Acre; or see the advertisements in any of the scientific or technical journals, and choose for yourself.

J. EDWARDS.—"My Friend Smith" began with the fifth volume, in the November part for 1832.

A READER FROM THE FIRST.—Apply direct to the Horse Guards, and mark your letter "Recruiting."

M. FOUBOURG.—1. You will find a list of French churches in London in the London Directory. There is one in Bloomsbury Street, one in St. Martin's-le-Grand, and one in Monmouth Road, Bayswater. 2. For every purpose two halfpenny stamps are as good as a penny one.

COMPETITIONS.—M. E. H.—Join in the competition by all means. FLORENCE.—There is no objection to your sending more than one story, but the details as to name, age, etc., must be given with each.

C. O. BROWN.—If you can reach the trees the best plan is to crush the green flies with your fingers; if not, syringe with soap and water.

No. 327.—Vol. VII.

SATURDAY, APRIL 18, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN:

A TALE OF CITY LIFE.

By TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER III.—NUMBER SIX, DULL STREET.

PROBABLY no London street ever rejoiced in a more expressive name than Dull Street. It was not a specially dirty street, or a specially disreput-

The Arrival at Dull Street.

able street, or a specially dark street. The neighbourhood might a hundred years ago have been considered "genteel," and the houses even fashionable, and some audacious antiquarians went so far as to assert that the street took its name not from its general appearance at all, but from a worthy London alderman, who in the reign of George I. had owned most of the neighbouring property.

Be that as it may, Dull Street was—and for all I know may still be—one of the duller streets in London. A universal seediness pervaded its houses from roof to cellar; nothing was as it should be anywhere. The window-sashes had to be made air-tight by wedges of wood or paper stuck into the frames; a bell in Dull Street rarely sounded after less than six pulls; there was scarcely a sitting-room but had a crack in its grimy ceiling or a handle off its ill-hung door, or a strip of wall-paper peeling off its walls. There were more chairs in the furnished apartments of Dull Street with three legs than there were with four, and there was scarcely horsehair enough in the twenty-four sofas of its twenty-four parlours to suffice for an equal quantity of bolsters.

In short, Dull Street was the shabbiest genteel street in the metropolis, and nothing could make it otherwise. A well-built, tastefully-furnished house in the middle of it would have been as incongruous as a new patch in an old garment, and no one dreamt of disturbing the traditional aspect of the place by any attempt to repair or beautify it.

Indeed, the people who lived in Dull Street were as much a part of its dulness as the houses they inhabited. They were for the most part retired tradesmen, or decayed milliners, or broken-down Government clerks, most of whom tried to eke out their little pensions by letting part of their lodgings to others as decayed and broken-down as themselves.

These interesting colonists, whose one bond of sympathy was a mutual seediness, amused themselves for the most part by doing nothing all day long, except perhaps staring out of the window in the remote hope of catching sight of a distant cab passing the street corner, or watching to see how much milk their opposite neighbour took in, or reading the news of the week before last in a borrowed newspaper, or talking scandal of one neighbour to another.

"Jemima, my dear," said a middle-aged lady, who, with her son and daughter, was the proud occupant of No. 4, Dull Street—"Jemima, my dear, I see to-day the bill is hout of the winder of number six."

"Never!" replied Jemima, a sharp-looking young woman of twenty, who had once in her life spent a month at a ladies' boarding-school, and was therefore decidedly genteel. "I wonder who's coming."

"A party of three, so I hear from Miss Moulden's maid which is niece to Mrs. Grimley: a widow"—here the speaker snuffled slightly—"and two childer—like me."

"Go on!" said Jemima. "Any more about them, ma?"

"Well, my dear, I do hear as they 'ave come down a bit."

"Oh, ah! lag!" put in the speaker's son, a lawyer's clerk in the receipt of two pounds a week, to whom this intelligence appeared particularly amusing; "we

know all about that—never heard that sort of tale before, have we, ma? Oh, no!" and the speaker emphasised the question by giving his widowed mother a smart dig in the ribs.

"For shame, Sam! don't be vulgar!" cried the worthy lady; "how many times have I told you?"

"All right, ma," replied the legal young gentleman; "but it *is* rather a wonner, you know. What were they before they came down?"

"Gentlefolk, so I'm told," replied the lady, drawing herself up at the very mention of the name; "and I hintend, and I 'ope my children will do the same, to treat them as fellow-creatures with hevery consideration."

"And how old is the babies, ma?" inquired Miss Jemima, whose gentility sometimes had the advantage of her grammar.

"The babies!" said the mother; "why, they're young gentlemen both of 'em—old enough to be your sweetheart!"

Sam laughed profusely.

"Then what did you say they was babies for?" demanded Jemima, pettishly.

"I never!"

"You did, ma, I heard you! Didn't she, Sam?"

"So you did, ma. Come now, no crackers!" said Sam.

"I never; I said 'childer,'" pleaded the mother.

"And ain't babies childer?" thundered Miss Jemima.

"Ad'er there, Jim!" chuckled the dutiful Samuel, this time favouring his sister with a sympathetic nudge. "Better give in, and own you told a cracker, ma!"

"Shan't!" said the lady, beginning to whimper. "Oh, I wish my poor 'Oward was here to protect me! He was a gentleman, and I'm glad he didn't live to see what a pair of vulgar brats he'd left behind him, that I am!"

"There you go!" said Sam; "taking on at nothing, as per usual! No one was saying anything to hurt you, old girl. Simmer down, and you'll be all the better for it. There now, dry your eyes; it's all that Jim, she's got such a tongue! Next time I catch you using language to ma, Jim, I'll turn you out of the house! Come, cheer up, ma."

"Yes, cheer up, ma," chimed in Jemima; "no one supposes you meant to tell fibs; you couldn't help it."

Amid consolations such as these the poor flurried lady subsided, and regained her former tranquillity of spirit.

The Shucklefords—for such was the name of this amiable family—were comparatively recent sojourners in Dull Street. They had come there six years previously on the death of Mr. Shuckleford, a respectable wharfinger, who had saved up money enough to leave his wife a small annuity. Shortly before his death he had been promoted to the command of one of the Thames steamboats plying between Chelsea and London Bridge, in virtue of which office he had taken to himself—or rather his wife had claimed for him—the title of "captain," and with this patent of gentility had held up her head ever since. Her children, following her good example, were not slow to hold up their heads too, and were fully convinced of their own gentility. Samuel Shuckleford had, as his mother termed it, been "entered for the law" shortly after

his father's death, and Miss Jemima Shuckleford, after the month's sojourn at a ladies' boarding-school already referred to, had settled down to assist her mother in the house work and maintain the dignity of the family by living on her income.

Such were the new next-door neighbours of the Crudens when at last they arrived, sadly, and with the new world before them, at No. 6, Dull Street.

Mr. Richmond, who, with all his unfortunate manner, had acted a friend's part all along, had undertaken the task of clearing up affairs at Garden Vale, superintending the payment of Mr. Cruden's debts, the sale of his furniture, and the removal to Dull Street of what little remained to the family to remind them of their former comforts.

It might have been better if in this last respect the boys and their mother had acted for themselves, for Mr. Richmond appeared to have lazy notions as to what the family would most value. The first sight which met the boys' eyes as they arrived was their tennis-rackets in a corner of the room. A very small case of trinkets was on Mrs. Cruden's dressing-table, and not one of the twenty or thirty books arranged on the top of the sideboard was one which any member of the small household cared anything about.

But Mr. Richmond had done his best, and being left entirely to his own devices, was not to be blamed for the few mistakes he had made. He was there to receive Mrs. Cruden when she arrived, and after conducting the little party hurriedly through the three rooms destined for their accommodation, considerably retired.

Until the moment when they were left to themselves in the shabby little Dull Street parlour, not one of the Crudens had understood the change which had come over their lot. All had been so sudden, so exciting, so unlooked-for during the last few weeks, that all three of them had seemed to go through it as through a dream. But the awakening came now, and a rude and cruel one it was.

The little room dignified by the name of a parlour was a dingy, stuffy apartment of the true Dull Street type. The paper was faded and torn, the ceiling was discoloured, the furniture was decrepit, the carpet was threadbare, and the cheap engraving on the wall, with its title, "As Happy as a King," seemed to brood over the scene like some mocking spirit.

They passed into Mrs. Cruden's bedroom, and the thought of the delightful snug little boudoir at Garden Vale sent a shiver through them as they glanced at the bare walls, the dilapidated half-tester, the chipped and oddly assorted crockery.

The boys' room was equally cheerless. One narrow bed, a chair, and a small washstand was all the furniture it boasted of, and a few old cuttings of an antiquated illustrated paper pinned on to the wall afforded its sole decoration.

A low dreary whistle escaped from Horace's lips as he surveyed his new quarters, followed almost immediately by an equally dreary laugh.

"Why," gasped he, "there's no looking-glass! However is Reg to shave?"

It was an heroic effort and it succeeded. Mrs. Cruden's face lit up at the

sound of her son's voice with its old sunshine, and even Reginald smiled grimly.

"I must let my beard grow," said he. "But, mother, I say," and his voice quavered as he spoke, "what a miserable room yours is! I can't bear to think of your being cooped up there."

"Oh, it's not so bad," said Mrs. Cruden, cheerily. "The pink in the chintz doesn't go well with the scarlet in the wall-paper certainly, but I dare say I shall sleep soundly in the bed all the same."

"But such a wretched look-out from the window, mother, and such a vile jug and basin!"

Mrs. Cruden laughed.

"Never mind about the jug and basin," said she, "as long as they hold water, and as for the look-out—well, as long as I can see my two boys' faces happy that's the best view I covet."

"You never think about yourself," said Reginald, sadly.

"I say, mother," said Horace, "suppose we call up the spirits from the vasty deep and ask them to get tea ready."

This practical suggestion met with general approbation, and the little party returned more cheerily to the parlour, where Horace performed marvellous exploits with the bell-handle, and succeeded, in the incredible time of seven minutes, in bringing up a small slipshod girl, who, after a good deal of staring about her, and a critical survey of the pattern of Mrs. Cruden's dress, contrived to gather a general idea of what was required of her.

It was a queer meal, half ludicrous, half despairing, that first little tea-party in Dull Street. They tried to be gay. Reginald declared that the tea his mother poured out was far better than any the footman at Garden Vale used to dispense. Horace tried to make fun of the heterogeneous cups and saucers, Mrs. Cruden tried hard to appear as though she was taking a hearty meal, while she tasted nothing. But it was a relief when the girl reappeared and cleared the table.

Then they unpacked their few belongings, and tried to enliven their dreary lodgings with a few precious mementoes of happier days. Finally, worn out in mind and body, they took shelter in bed, and for a blessed season forgot all their misery and forebodings in sleep.

There is no magic equal to that which a night's sleep will sometimes work. The little party assembled cheerfully at the breakfast-table next morning, prepared to face the day bravely.

A large letter in Mr. Richmond's handwriting lay on Mrs. Cruden's plate. It contained three letters—one from the lawyer himself, and one for each of the boys from Wilderham. Mr. Richmond's letter was brief and businesslike.

"DEAR MADAM,—Enclosed please find two letters, which I found lying at Garden Vale yesterday. With regard to balance of your late husband's assets in your favour, I have an opportunity of investing same at an unusually good rate of interest in sound security. Shall be pleased to wait on you with particulars. Am also in a position to introduce the young gentlemen to a business opening, which, if not at first important, may seem to you a favourable opportunity. On these points I shall have the honour of waiting on you during to-morrow afternoon, and meanwhile beg to remain

"Your obedient servant,

"R. RICHMOND."

"We ought to make sure what the investment is," said Reginald, after hearing the letter read, "before we hand over all our money to him."

"To be sure, dear," said Mrs. Cruden, who hated the sound of the word investment.

"I wonder what he proposes for us," said Horace. "Some clerkship, I suppose."

"Perhaps in his own office," said Reginald. "What an opening that would be!"

"Never you mind. The law's very respectable; but I know I'd be no good for that. I might manage to serve tea and raisins behind a grocer's counter, or run errands, or—"

"Or black boots," suggested Reginald.

"Black boots! I bet you neither you nor I could black a pair of boots properly to save our lives."

"It seems to me we shall have to try it this very morning," said Reginald, "for no one has touched mine since last night."

"But who are your letters from?" said Mrs. Cruden. "Are they very private?"

"Not mine," said Horace. "It's from old Harker. You may read it if you like, mother."

Mrs. Cruden took the letter and read aloud,

"Dear Horrors—"

("That's what he calls me, you know," explained Horace, in a parenthesis.)

"I am so awfully sorry to hear of your new trouble about money matters, and that you will have to leave Garden Vale. I wish I could come over to see you and help you. All the fellows here are awfully cut up about it, and lots of them want me to send you messages. I don't know what I shall do without you this term, old man, you were always a brick to me. Be sure and write to me and tell me everything. As soon as I can get away for a day I'll come and see you, and I'll write as often as I can."

"Your affectionate,

"T. HARKER."

"P.S.—Wilkins, I expect, will be the new monitor in our house. He is sure now to get the scholarship Reg was certain of. I wish to goodness you were both back here."

"He might just as well have left out that about the scholarship," said Reginald; "it's not very cheering news to hear of another fellow stepping into your place like that."

"I suppose he thought we'd be curious to know," said Horace.

"Precious curious!" growled Reginald.

"But who's your letter from, Reg?" asked Mrs. Cruden.

"Oh, just a line from Bland," replied he, hastily putting it into his pocket; "he gives no news."

If truth must be told, Blandford's letter was not a very nice one, and Reginald felt it. He did not care to hear it read aloud in contrast with Harker's warm-hearted letter.

Blandford had written,

"Dear Cruden,—I hope it's not true about your father's money going all wrong. It is a great sell, and fellows here, I know, will be very sorry. Never mind, I suppose there's enough left to make a decent show; and between you and me it would go down awfully well

with the fellows here if you could send your usual subscription to the football club. Harker says you'll have to leave Garden Vale. I'm awfully sorry, as I always enjoyed my visits there so much. What are you going to do? Why don't you try for the army? The exams are not very hard, my brother told me, and of course it's awfully respectable if one must work for one's living. I must stop now, or I shall miss tennis. Excuse more.

"Yours truly,

"G. BLANDFORD."

Reginald knew the letter was a cold and selfish one, but it left two things sticking in his mind which ran-led there for a long time. One was that come what would he would send a guinea to the school football club. The other was—it was it quite out of the question that he should go into the army?

"Awfully rough on Reg," said Horace, "being so near that scholarship. It'll be no use to Wilkins, not a bit, and fifty pounds a year would be something to—"

Horace was going to say "us," but he pulled up in time and said "Reg."

"Well," said Reg, "as things have turned out it might have come in useful. I wonder if it wouldn't have been wiser, mother, for me to have stayed up this term and made sure of it?"

"I wish you could, Reg; but we have no right to think of it. Besides, you could only have held it if you had gone to college."

"Oh, of course," said Reg; "but then it would have paid a good bit of my expenses there; and I might have gone on from there to the army, you know, and got my commission."

Mrs. Cruden sighed. What an awakening the boy had still to pass through!

"We must think of something less grand than that, my poor Reg," said she; "and something we can share all together. I hope Mr. Richmond will be able to hear of some business opening for me as well as you, for we shall need to put our resources together to get on."

"Mother," exclaimed Reginald, overwhelmed with sudden contrition, "what a selfish brute you must think me! You don't think I'd let you work while I had a nerve left. I'll do anything—so will Horace, but you shall not, mother, you shall not."

Mrs. Cruden did not argue the point just then, and in due time Mr. Richmond arrived to give a new direction to their thoughts.

The investment he proposed seemed a good one. But, in fact, the little family knew so little about business generally, and money matters in particular, that had it been the worst security possible they would have hardly been the wiser.

This point settled, Mr. Richmond turned to his proposals for the boys.

"As I said in my letter, Mrs. Cruden," said he, "the opening is only a modest one. A company has lately been formed to print and publish an evening paper in the city, and as solicitor to the company I had an opportunity of mentioning your sons to the manager. He is willing to take them, provided they are willing to work. The pay will begin at eighteen shillings a week, but I hope that they would soon make their value felt and command a better position. They are young yet."

"What shall we have to do?" asked Horace.

"That I cannot exactly say," said the lawyer; "but I believe the manager would expect you to learn the printer's business from the beginning."

"What would the hours be?" asked Mrs. Cruden.

"Well, as it is an evening paper, there will fortunately be no late night work. I believe seven in the morning to eight at night were the hours the manager mentioned."

"And—and," faltered the poor mother, who was beginning to realise the boys' lot better than they did themselves—"and what sort of companions are they likely to have, Mr. Richmond?"

"I believe the manager is succeeding in getting respectable men as workmen. I hope so."

"Workmen!" exclaimed Reginald, suddenly. "Do you mean we are to be workmen, Mr. Richmond? Just like any fellows in the street. Couldn't you find anything better than that for us?"

"My dear Master Cruden, I am very sorry for you, and would gladly see you in a better position. But it is not a case where we can choose. This opening has offered itself. Of course, you are not bound to accept it, but my advice is, take what you can get in these hard times."

"Oh, of course, we're paupers, I forgot," said Reg, bitterly; "and beggars mayn't be choosers. Anything you like, mother," added he, meeting Mrs. Cruden's sorrowful look with forced gaiety. "I'll sweep a crossing if you like, Mr. Rich-

mond, or black your office boy's boots, anything to get a living."

Poor boy! He broke down before he could finish the sentence, and his flourish ended in something very like a sob.

Horace was hardly less miserable, but he said less. Evidently, as Reg himself had said, beggars could not be choosers, and when presently Mr. Richmond left, and the little family talked the matter over late into the afternoon, it was finally decided that the offer of the manager of the "Rocket" Newspaper Company, Limited, should be accepted, and that the boys should make their new start in life on the Monday morning following.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy-Earl," etc.

CHAPTER XVI.—(continued.)

IVAN was shivering with cold, for the weather was giving signs of commencing winter. There was a light frost on the ground, and though the boots with which he had been supplied were not very bad, he had no stockings on his feet, and no covering on the body save the miserable cotton shirt and equally miserable trousers. He was more dead than alive when they arrived at the Tschast and he was confronted with the sergeant in charge. But the room was warm, and the warmth revived Ivan, who told his tale to this officer with more readiness than he had talked to the underling, and evidently produced a better impression.

"What is your Christian name, what is your patronymic, and what your family name?"

"Ivan Ivanovitch Dobroff," was the reply.

"Why it is not long since there was a large reward offered for a missing boy of that name, but he was found."

"I was found in the monastery of Kupsk," said Ivan, "and I was placed there by friends of this very Anastasia whom I came to seek. Can you tell me anything about her?"

"She was transported to the mines of Siberia. But all this is beside the mark. You are now charged with stealing a knife, the property of this honest butcher, and it does not depend upon me, but upon the officer, to decide whether you are to be detained or not. He will be here presently; sit down."

Ivan tremblingly obeyed, and, overcome with the sense of helplessness and wretchedness, he burst into a passionate flood of tears, and sobbed as though his heart would break.

"What is all this row about?" exclaimed a tall, handsome, but not very brilliant-looking officer of police, entering the guard-room of the tschast as the sergeant was entering into an agreeable chat with the butcher.

"A young thief has been arrested who wants to make us believe him to be a gentleman in disguise."

"Oh, indeed!" said the officer. "Very much disguised indeed, as it would seem! Here you! what's your name?"

"Ivan Dobroff," said our hero, between his sobs.

"WHAT!" cried the officer. "How can you prove that?"

"Ah! how indeed?" said the butcher.

"Silence!" thundered the officer. "Has the charge been formally entered?"

"Yes," answered the sergeant. "But there is no magistrate sitting to-morrow, and there is nothing to be done but to put him in a cell till Thursday if you are going to let him plead."

"What's the case?"

"The boy is taken by this butcher, from whom he stole a large and valuable knife some days ago. The knife is recognised, and so I took the charge. The boy cannot account for its possession."

"I have accounted for it," said Ivan, "and I have told the truth, and the nasty greasy butcher tells lies. I wish I had never gone out to find Annie!"

"And who is Annie?"

"Annie Feodorovna Hermann."

"Are those the people who have been so much talked about of late, and about whom there was the grand affair when the gendarmes were killed and General Kakaroff nearly?"

"The very same," answered the sergeant.

"And what relation were they to you, boy?"

"No relation, but she was a very good friend."

"Now, look here, malchitchka [brat of a boy]; it is not much to your credit to have such friends. The less you say about them the better. You are charged as a thief, and admit your friendship with the very worst class of people, and yet you claim to be Ivan Dobroff, the adopted son and heir of Mr. Smirnoff. Now this is a very clever trick, my youngster, but either too clever or not clever enough. I shall keep you in prison until the mirovoi [district judge] sits, then I will ask him to cause your

arrest to be made public, and then if you have more respectable connections than the Hermanns they will hear of you. If not you may have a chance of following them to Siberia, and there life is not so very gay."

"Will you send to Mr. Smirnoff and tell him I am here?"

This request seemed to amuse the sergeant, butcher, and all the underlings, but not the officer, who became grave as he asked Ivan how it was that he was thus wretchedly clad, seeing that it was cold.

"I have already told you that I left the house in my ordinary dress, not the uniform of the Gymnasium."

"Why you told me," said the sergeant, "that your Gymnasium mantle and kepi [little uniform cap] had been taken from you in the Novoye Derayvnie. How does that agree with having your ordinary clothes on?"

"I had thrown the mantle and kepi over my ordinary dress to keep me warm, because my paletot and cap were in my own room. I left the house for a walk, and in the moment saw the things hanging in the hall and took them. If you go to the house you will find the truth of what I say. You will find my cap and my paletot in the bedroom, and my Gymnasium uniform in the wardrobe in the corner near the window. My watch and money were taken from me, and I was thrown into the cellar with nothing on. I beg you to send to Mr. Smirnoff, and he will tell you that I am Ivan Dobroff. Or send to General Kakaroff; he knows me very well!"

At this the officer started.

"What!" he said; "do you know his High Excellency?"

"Of course I do," said Ivan, "and I know Anna Feodorovna also."

"Look here, you fellows," exclaimed the officer, angrily. "How can you behave in so shameful a way to a young gentleman like this?"

"Why you see he is charged with theft, and I am obliged to retain him."

"Who charges him with theft?"

"The butcher charges him with stealing his knife, and his man also recognised the knife in this boy's possession as being the same that was taken from the shop some weeks ago."

"I have told you how I came by the knife, and more than that, I have told you that the man from whom I took the knife lies locked up in the cellar of the house in the Novoye Derayvnie, and if you send quickly you will find him there now. Here is the key!"

The police-officer here gave orders that a party of men under the sergeant should at once proceed to the house Hermann in the Novoye Derayvnie. To the butcher he said,

"You are quite right in having this boy arrested. You see, if his story should turn out a true one, the best thing that could have happened to him is your putting him in our hands to see him righted, and if he be a thief you have done well in causing him to be brought to justice."

Nothing pleases the Russians so much as praise. As a nation they are singularly alive to the magic of kindness. This certainly lays them open to flattery, and knowing how much they like it themselves they lay it on pretty thickly when talking to others. The butcher was entirely won by this praise from the officer, and performed a series of bows that would have done honour to a monk before a shrine, and he felt so pleased with himself that he got quite fond of Ivan, saying as he prepared to depart,

"God give that you may turn out to be what you wish to make us believe you are!"

As soon as he was gone the officer directed a soldier to find a coat in which Ivan might be wrapped. The man left the guard-room and soon returned with a small shuba (or fur coat for the winter), which belonged to one of the non-commissioned officers, whose rooms were close by, and who had a family of boys. This coat just fitted Ivan, and as soon as he was dressed the officer said to him,

"You see, I give you credit for telling the truth, although the rules of the service compel me to have official proof of it. You are my prisoner, and must come with me, and don't try any tricks of escaping from my custody, or it will be much worse for you, I can tell you. Now, move on. Nikietier, you had better come with us to show our young prisoner how useless it would be to attempt to escape. Now sit down and wait till I am ready."

So Ivan sat down and stared about him at the unfamiliar objects by which he was surrounded. The meanness of the place contrasted strangely with its strength and size. There seemed nothing to guard and watch, and yet the amount of guarding and watchfulness would have led the spectator to imagine that heaps of wealth were stored up and guarded behind the walls and bars that frowned at the intruder from every part of the tschast. There were many things for the officer to do: reports to glance over and sign; passports belonging to the various inhabitants of the district to stamp, exchange, sign, mark, or return, as the case might be; dvorniks to interview on the momentous question of new servants engaged by families in dwellings over which they had special charge. There were servants applying for permission to change their places. Masters were there

who had been sent for to be interviewed on account of some irregularity in the passports of servants, which had laid them open to fines. Persons were there who had let rooms in their houses, or rather portions of flats, to other persons, and had neglected to give due notice to the police of the advent of the tenant. These and many other cases were arranged by the payment of fines to the police, and in many cases by the payment to the officer or sergeant of a larger sum than the fine itself would have been by timid people who wished to keep well with the police, or by foreigners who knew that the comfort of their stay in Moscow or the power of remaining there at all depended on the caprice of a police-officer or the good will of a dvornik.

You who "live at home at ease" in London may be grateful to a system which combines so much personal safety with so much personal freedom, for you can never imagine the countless annoyances which arise from the tyranny of the domestic passport system and the want of free will that arises when every movement in a household is watched and regulated by police.

Ivan was not troubled by any reflections of this kind. In the first place he highly appreciated the comfort of the shuba in which he was wrapped, and which set all thought of cold at defiance; secondly, he wondered what Mr. Smirnoff would do when he found his little *protégé* missing a second night; and, thirdly, he wondered why they could have sent such a good girl as Annie to Siberia—a word fraught with every possible horror to the mind of a Russian.

Among the cases which came before his new-found friend the police-officer was one in which a person had obtained possession of a passport intended for somebody else, and had contrived to travel upon it, but at last had been detected by the dvornik of a house (in which he had taken a furnished room) who happened to know the person to whom the passport referred. The possessor of this false document was brought before the officer of the tschast and would doubtless have been very heavily punished, but fortunately a friend of the officer's was also a particular friend of his, and thus there was a way opened for negotiations which ended in the payment of a sum of money. Of course this was bad, but the police is such an immense force in Russia that it is quite impossible for the Government to pay the officers anything like such salaries as should correspond to their rank and importance, they are therefore almost compelled to take bribes to be able to live at all. It is not uncommon when you take a little lodging and furnish it, as soon as you are in order you are honoured by a visit from a splendid individual resplendent in silver and silver lace. He turns out to be the officer of your "kvartal," or subdivision of your tschast, and you invite him to take a glass of tea with you. He accepts the invitation, and also an envelope containing a ten-rouble note as a fee for his countenance and protection. It is worth the money to see such epaulettes at your humble tea-table, and the man himself has a host of interesting things to tell you into the bargain.

Now Ivan was not a stupid boy, and the little circumstance of the passport greatly struck his fancy. He listened to the whole case with intense interest; he

looked on the fortunate possessor of the false document as little less than a hero, and he resolved to improve the occasion by learning how such tricks were played, for he had a vague idea that by some such means he should be able to do something to aid Annie, to whom he felt extravagantly grateful for her kindness and care during his sad adventures and unpleasant experience acquired through her father's means. He felt a strong impulse in his little venturesome heart to do something desperate in the service of one who had been a sister to him. Thus it flashed across him that in learning some of the ways of the Russian police he might be learning how to aid his friend. So he sat as quiet as a lamb until the officer had finished all the formalities which made up his work. Then the books were closed, the secretaries locked their desks, and Egor Sergeivitch Malutin, captain and kvartal-master of the Katmiewskie-tschast, rose, buttoned his uniform, put on his sword and cap, ordered a soldier to bring Ivan after him, lighted the unavoidable cigarette, and strode across the courtyard to his private quarters.

He walked through a small door, before which a police-soldier was on guard who saluted to his officer as he passed. This door led to a staircase common to several official dwellings connected with the tremendous machinery of the police system. On the first floor Malutin paused, and drawing a latchkey from his pocket opened his outer door. Within they found a broad threshold, beyond which was a second door, the object being to shut out the cold of the staircase before opening the actual door admitting into the rooms themselves. These rooms were dark now but very warm (fuel is found by the Government). The captain struck a match and showed Ivan by the lamp which he then lighted a large but oddly-furnished room. There were three windows shut in by double sashes, well fixed and secured against the outer air. Passing through the first room they found the sitting-room garnished in poor fashion, but still having some pretensions to elegance. There were white lace curtains to the two windows of the room and an old and shabby pier-glass between them. The furniture was of painted wood, covered with cheap damask. It consisted of a sofa, two arm-chairs, and six ordinary chairs. The last room was the "cabinet" of the master of the house, with a cheap writing-table, a book-case, and the usual sofa. A door at the back of this room led to the bedrooms of Captain Malutin and his wife, of his daughter, and the one maid-servant, a partition of wood having been made to divide the latter room into two portions, the last room at the back being, as usual, the kitchen.

There was no one in the dwelling of the gallant captain. His wife and daughter had gone out to a musical tea-party in the neighbourhood, and the maid-servant had leave for the evening. Egor Sergeivitch therefore went to the back staircase and called his police-soldier servant, whom he ordered to set up the samovar. He then came back to Ivan, and, making him remove his hot shuba, furnished him with an undress jacket of his own, and sat down for a good long private chat with the boy.

(To be continued.)

A SILENT WITNESS.

BY SOMERVILLE GIBNEY.

CHAPTER II.

THE Rev. Walter Welch, the senior mathematical master at Langton School, was seated at his study table, which was covered with the answers to the problem papers, which he had been looking over. Mr. Welch did not teach the Remove. In the Field examinations it was a rule that the papers for the various forms should not be set by their own masters. "It will be a close race between MacVicar and Dyer after all," he said to himself; "and from what Dowling remarked I never expected MacVicar would be anywhere near it." (Mr. Dowling was the mathematical master who took the Remove.)

"Let me see, Swain's and Talbot's and Lyon's papers are all good, but the other two are before them. Yes; the medal lies between these two. In their arithmetic, algebra, and Euclid papers the boys are within twenty marks of each other, MacVicar having the best of it, but then Dyer regains those in his *viva voce*, so that the result depends on the problems. Really, I'm growing as excited over it as if I were one of the competitors; but, fortunately, I can soon satisfy myself. I have marked the answers, so have only to add them up. Let me see, now, I'll take Dyer's first. Right, right, right," turning over the sheets; "I declare the boy's got full marks. It will be hard to beat that, MacVicar. Dyer should turn out a wrangler in time, and will, too, if he only has application. This last problem's a stiff one, and I'm surprised any of the boys have floored it."

Then, as he read through the problem, "Yes, your figure is all right, but, from your construction of it, you appear as if you were coming to grief over it; and yet in the proof you pull yourself together, and wind up uncommonly neatly. Yes, I must give you full marks. Now then for MacVicar's. Right, right, right, right, right," turning over the various sheets, as in the previous case, till the last one is reached.

"Hallo! what's this? Only eight marks! That loses you the medal, I am afraid, my boy, but as it's so close a thing I'll look through it again. No, MacVicar, I'm afraid I can't give you more than eight marks. Your figure is all right, and the construction is good, but you are not clear in the proof. You are a duffer. You had it all before you, and yet you missed seeing it. Look how Dyer gathers the threads together and makes the whole thing clear. You are a young duffer," continued Mr. Welch, as if he had had MacVicar in front of him and was addressing him; and then, looking from one sheet to the other as he held one in each hand, he exclaimed, "Hallo! hallo! this is curious. Dyer uses the letters L M N O P Q R, and MacVicar has I J K L M N O; and though both of the boys have that line, which they have lettered L M in their figures, yet neither of them has made use of it. There's something wrong here. They've either done it together, or else one has cribbed from the other; but which it is I should be sorry to say. I had better hear what Dowling's opinion is."

Mr. Welch rang for his butler and desired him to go over to Mr. Dowling's and ask him, if he were at liberty, to come and see him. He had not long to wait. Mr. Dowling soon came, and long and earnestly the two masters consulted together.

The following morning, as the Remove were leaving the room after Euclid, Mr. Dowling desired MacVicar to stay, and as soon as they were alone, asked him if he had kept the papers on which he had worked out the problems in the examination paper.

"Yes, sir, I think I have it. I did them on one sheet, so that they might all be kept together."

"Very well, then, after breakfast take it to Mr. Welch, he has a question to ask you about them. I may tell you you are well up for the medal, and do not, therefore, mention this matter to any one."

MacVicar duly appeared with his sheet of figures before Mr. Welch, who asked him various questions about them, as to the order in which he had done them, which he found most difficult, and when he had done the last one, which he had lettered I J K L M N O?

"That one, sir? Oh, I remember. I did that the night before the last time but two we did Homer. That would be the evening of last Tuesday fortnight. Let's see, to-day is Thursday, the 26th, so that would make it Tuesday, the 10th. That was when I did it, sir."

"Thank you, MacVicar; and now may I ask what was the reason of your choosing I J K, etc., for the letters, eh?"

The boy smiled and blushed, as he answered, "Well, sir, I suppose it was fancy. I J are my initials, Isaac John; but I didn't mean it for cheek—impertinence, I mean, sir."

"No, no, boy, I never thought you did; but they were funny letters to choose, so I thought I would ask you. You can go now, but don't mention my having seen you."

"Very well, sir; good morning." And MacVicar left the room.

That afternoon Dyer received a similar summons, and he, too, went to Mr. Welch with his papers. On looking over the various scraps, Mr. Welch said, "But, Dyer, I don't see among them this last one."

"No, sir; I did that on the back of a letter when I was down in the playing-fields one day. I think I have it in my pocket. Yes, here it is. There's nothing in the letter—you can read it, sir."

"Did it in the playing-fields, did you? Why cricket's been over some time now."

"Yes, sir; it was the first I did, directly the papers were given out, more than a month ago. I was waiting for my innings, and the idea flashed across me, and I sketched it down."

"And what made you use these extraordinary letters? I see you have only L M N O in your first sketch."

"I don't think I can give any reason, sir; they must have come the first into my head."

"That will do, Dyer; I may tell you your papers are very good. You can go now."

"Thank you, sir." And Mr. Welch was left alone.

For some time he sat comparing Dyer's rough sketch with that of MacVicar's. He was puzzled. "Which boy is the blackguard, I wonder? One of them is, I am certain. MacVicar gives a plausible reason for his letters; Dyer falls back on chance. It may be a coincidence, but it is a very ugly-looking one." Then he leant back in his chair and appeared to seek a solution to the mystery on the ceiling, all the time turning and twisting Dyer's letter between his fingers. At length his eyes fell on it, and he read it idly, while his thoughts were on the problems. It was in the large round hand of a child, and ran as follows:—

"Monday, 9th.

"DEAR ALEC,—I hop you are quite well. My rabbit has some little ones. I have been looking at them, but they have not got there is open. I want you to come home. I have no fun now. The cat cort a little berd this morning. I have nothing more to tel you.

"Your affte. brother,

"WILLIAM FORBES DYER."

Suddenly Mr. Welch became interested and sat bolt upright in his chair, read the letter once more, and rushed to an almanack

hanging against the wall. "Yes," he exclaimed, with a sigh, "Dyer's the culprit; he's convicted himself, though he little knows it. I must see the Doctor about this at once;" and gathering the papers together he took his hat and made his way to the head master's house.

The day for making known the result of the Remove examination for the Field medal had arrived, and, according to custom, the whole school was assembled in the Speech-room, as the big hall was called, to hear the list read out. The Doctor having entered, and taken his position behind the table at the end, said,

"Boys, you all know the reason we are gathered here—namely, to learn the result of the Remove examination for the mathematical medal presented by Sir John Field. In the first place I may congratulate the form as a body on their work. The papers, as a whole, have been good, very good, and the contest has been a keen one. And now, in conformity with the founder's directions, I have to ask the usual questions. Remove, stand up. Layton, on your honour have you done your problem paper without assistance from any one?"

"Yes, sir."

"Briggs, have you?"

"Yes, sir."

"Northcotte, have you?"

"Yes, sir."

"Dyer, have you?"

There was a change in the Doctor's voice as he asked the question which was noticed by many, but the answer came without hesitation.

"Yes, sir."

"Talbot, have you?"

"Yes, sir."

And so on, right through the form.

"Very well," continued the Doctor; "as you have all stated on your honour that you have done the paper fairly, it now only remains for me to read out the list, commencing from the bottom: Jones, Pain, Trevor, Northcotte, Briggs," etc., until all the names had been called with the exception of Dyer and MacVicar.

The Doctor paused, and then continued,

"Boys, now comes a very painful duty on my part, and one which I am deeply hurt to think any boy in this school should have caused me to perform. The two remaining names are those of Dyer and MacVicar. These two ran neck and neck for the medal, and until the problem paper came were equal. In this Dyer gained two marks on his rival, and would have gained the medal but for dishonesty. His crime has been brought to light, I am thankful to say, in a curious manner. Dyer, stand out."

Pale as death, the boy obeyed the command, and stood in the centre of the room, trembling violently. There was no bravado about him now. He could not face the gaze of his schoolfellows, and stood before them a cowering cheat.

"Dyer," continued the Doctor, "you have had the chance of confessing your error, but you refused it, and added a cowardly lie to your dishonesty. I shall now tell the school how your crime was discovered, and shall then be ready to hear anything you may have to plead in extenuation or explanation."

Then again addressing the school, he continued,

"Dyer's and MacVicar's problem papers were so nearly equal that there were only two marks between them, but in looking them over Mr. Welch discovered that both had used unusual letters in the last problem. This MacVicar explained by stating that he had taken the initials of his name as the first two, and gone on with those following them.

Dyer could only attribute the fact to chance. Mr. Welch was suspicious that there had been copying between them, and requested the boys to bring the papers on which they worked the problems out in the first instance. This they did, and MacVicar gave as the date on which he did the last problem, the 10th of this month. Dyer asserted that he had done the same problem on the back of a letter (which he handed to Mr. Welch) in the cricket-field some time ago. Mr. Welch happened to look at the letter (for which he had Dyer's permission), and found it dated Monday, 9th. The 9th last month was on a Friday, on the month before that it was on a Wednesday, on the one before that on a Sunday, but on *this*

month it was on a Monday. If, therefore, Dyer's story be true, he worked his problem out on a letter which at the time was never written, much less received."

"Don't go on, sir," broke in the wretched boy. "I confess I copied the figure from MacVicar's paper one night I went into his room. Without it I should never have done the problem. Once having seen the figure I easily worked the thing out. He knew nothing of this because he was not in his room at the time."

"I am glad to see, Dyer, you have some spark of honourable feeling left, though you have displayed it too late. Go to my room and wait for me there."

As soon as Dyer had gone the Doctor continued,

"After the confession we have just heard it but remains for me to congratulate you, MacVicar, on your success, and at the same time to hand you the medal, and to assure you that no suspicion whatever attaches itself to you."

Amid the hearty cheers of his schoolfellows MacVicar stepped to the table and received at the Doctor's hands the medal he had won.

Punishment is never a pleasant subject to write about, so my readers will excuse me if I draw a curtain over the after events in reference to Dyer.

(THE END.)

THE GOLD FISH.

By REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER II.

EDWIN ASTON made for the kitchen, where he delivered up his muddy clothes to the cook, with sundry regrets and apologies. He then walked as quietly as possible upstairs to his room, and paid much attention to his toilet, resolved to make himself unusually tidy in hopes of creating a favourable impression at the tea-table. He was minded to be particularly talkative during that meal on every subject he could think of that steered clear of fish.

The tea was laid out invitingly on the spotless tablecloth in the dining-room of Chesterton House as Edwin entered. Miss Davis was already seated at the teapot end of the table, and was pouring out a cup of the fragrant beverage. He took his seat with a forced smile, and at once began the conversation.

"Well, aunt, I hope you had a pleasant drive. It was such a beautiful afternoon. What did you see?"

"Thank you, Edwin; I like to hear you open conversation in that agreeable manner. I had an enjoyable drive, and found the Skipworths at home. They are very pleasant, clever, and well-informed people."

"Aunt, I should like to read that volume of Alison's history with the account of Napoleon's invasion of Russia. May I take it from the library?"

"Certainly, Edwin; I am always glad to encourage you in literary tasks. Historical study is of great value in forming the mind."

"Thank you, aunt. Do you think the old sow will have any little pigs this year? They were such jolly little rascals last time."

"I really cannot tell, Edwin. That topic is hardly suited to the refinement of the tea-table. You must be more careful and not so abrupt in passing from one subject to another. Your conversation should be more sustained. I had expected you to make further remarks upon your love of historical reading."

"Oh, I'm very sorry, aunt. The egg I had for breakfast this morning wasn't very nice. May I have some jam?"

The connection between the last statement and the request which followed it was not altogether clear to the aunt's well-balanced mind, but she gave consent; and as Edwin helped himself to the condiment he continued his conversation.

"I say, aunt, why don't you do your hair like Miss Trevor, who plays the organ in church? She had such a lovely chignon last Sunday, all plaited up with ribbons."

"Edwin, how often have I told you that personal remarks must never be heard in polite society. It is not good manners to draw attention to any peculiarity of another's dress or appearance. Besides which, I would sooner hear you comment upon the sermon you heard last Sunday than on the way the young person who presides at the organ arranges her hair. You distress me very much at times by the thoughtless and trivial character of your remarks. You must try and remember what I tell you."

Edwin put on an air of offended innocence, and answered, "I do try, aunt, but I think you are sometimes very hard upon me. I'm sure I didn't mean to be rude. You often make remarks on the way I do my hair."

"That's quite another thing, Edwin. It is my duty to take your mother's place in correcting your faults. But you would be more accurate in saying that I occasionally remark upon the way you do *not* do your hair. Whenever it is *done* I never make a remark upon it."

Edwin plumed himself with the idea that so far he had been eminently successful in keeping up the conversation, which had not flagged for a moment. He was now aware that in his anxiety to keep it up he had paid but little attention to the important matter of eating. His aunt showed evident signs of having pretty well finished her repast, and it was incumbent upon him to put his best leg foremost, so to speak, in the race, if he did not wish to be hopelessly left behind. So for some minutes he devoted his entire energies to the business of lading in tea and munching bread and jam. His aunt's falcon eye was upon him. He knew it, but pretended to be callous, though all the time he was inwardly apprehensive.

"Edwin, there are points about your way of eating and drinking which require improvement. You should not sip your tea with the spoon, and make such vulgar noises during the process. Take the cup in your right hand by the handle, thus, and drink without any sound. You should not bite but cut your bread, nor put jam into your mouth with the knife."

"All right, aunt, I'll try and remember in future. But isn't it wrong to waste food? There's half a pat of butter on your plate and all the crust of two bits of toast."

"Edwin, you forget yourself sadly, and are impertinent. My teeth are not so strong as they were. I am reserving these crusts for the gold fish."

The boy gave an involuntary start and blushed crimson, and in his confusion choked over a mouthful of bread, and made matters worse by swallowing his hot tea too fast. His aunt looked sternly at him, and was on the verge of administering a severe rebuke, but the boy decided that as she had spoken last it was his turn to go on. Restraining his convulsions with much difficulty, he continued the conversation as best he could from the point at which it had dropped, and said,

"Why don't you have some false ones, aunt? Old Pincers, the dentist, pulls them out at the first wrench, and he's got whole rows of teeth in his shop window. Do you know the fable about the old crab and its young one, aunt? I did it in Latin the other day, and got up top of the class."

"I am glad to hear you talk about your studies, Edwin. You know what an interest I take in your progress. I am delighted to hear that you have already advanced so far in the classics as to be reading the fables in the original language."

"It isn't the original language, aunt. Æsop wrote in Greek, and that cheat Phædrus cribbed them from him. Mr. Fields said so."

This last remark was too much for Miss Davis's nerves. To be flatly contradicted by her nephew was enough. To hear that a master of Highfield House deliberately encouraged his pupils in dishonesty by the fraudulent writings of ancient authors was absolutely insupportable. She resolved to write to Dr. Porchester at once on the subject. Mr. Fields was evidently not to be trusted to superintend the education of young and innocent boys. Rising from her chair, Miss Davis only said, "Edwin, if you have done your tea I think we had better go out into the garden."

"I'm rather tired, aunt. May I take the history book up to my room and read

quietly? I'd sooner not go out any more this evening."

"Very well, Edwin." The nephew began to beat a retreat from the room.

"Stay, Edwin; it is not good manners to bounce out of the room in that violent haste. Open the door gently for me, and wait till I have passed."

Miss Davis took up her parasol, and sailed majestically forth into the garden through the open bay window of the library. Edwin disappeared to his room without another thought of Napoleon. He was too nervous about the matter of the lost carp to care about the destruction of imperial armies. From the window of his room he could see the lawn. Ensnared behind the curtain he watched his aunt's progress in the garden.

Sure enough, after a turn or two up and down the broad gravel pathway, she stepped on to the lawn and made straight towards the fountain. The crusts were in her hand. She did not see the carp at first. She did not see it at last; no, not though she bent her head and brought her double eyeglass into focus and made a tour of the basin, peering closely into the water. Nay, more, she could not discover any signs of the pet carp, even though she closed her parasol and commenced operations of diving and dredging on an extensive scale among the ornamental stones at the bottom of the basin. She thought it possible that the carp might be taking an evening siesta in the seclusion of some sub-aqueous cave. But no success rewarded her search. Her brow darkened; ominous forebodings gathered in her soul. Where was the carp? What could have happened to it?

Miss Davis turned away from the fountain, holding her dripping parasol in the attitude of a nervous female confronted by a strange cow. Miss Davis

passed across the lawn, curiously scrutinised by her nephew's eye. He read her intention at a glance—beyond doubt bound for his room, and with all her canvas set.

Edwin grew red with excitement, and indulged in quaint antics akin to the movements of a Highland schottische as it ought not to be danced. He heard her steps deliberately ascending the stairs. He heard her heave a deep sigh when she reached the top, whether from the effects of physical exertion or mental distress he could not tell, but he delivered himself of the opinion that "the old lady was wheezing like a steam-roller." It is needless for me to remind you again that Edwin was a very unmannerly little boy,

"I fancy he is trying to hide from me."

whose example is quoted to be avoided, you understand, like that of all the other unmannerly little boys that figure in other school stories. I quite agree with

his aunt that he was often not particular about his language. He now emphasised his last remark by reference to one of the zodiacal signs, "Oh, Gemini! she's on the war-trail and no mistake!"

With all his mock bravado, accompanied by pantomimic action, Edwin—to use another of his expressions—was in a "blue funk." Nearer came the dreaded step, and he crept with extreme caution under the bed.

A knock at the door. No answer.

A louder knock. No answer.

The door was opened.

"Edwin, are you in your room?"

No answer.

Miss Davis put her head inside the door. Not seeing her nephew, she might have been expected to withdraw. But she didn't. She went and opened a cupboard, and shut it. She examined the window curtains. She pulled up the muslin hangings of the dressing-table. She didn't look under the bed, because it would have been a laborious and undignified operation. But she did not feel at all certain that Edwin was not there. In fact she was so confident on the matter that she went to the door and opened it, and called to the housemaid, "Jane! Jane!" She took three steps along the passage to call down the back stairs, leaving the door of Edwin's room open, and keeping an eye upon it all the time. "Jane, come here a moment, please."

The faithful domestic was at her mistress's side in a trice.

Preceding her to Master Edwin's room, the mistress said, "Jane, just see if Master Edwin is under the bed. I fancy he is trying to hide from me."

"Oh, miss, how shocking!"

The housemaid knelt down to obey the command.

"No, miss, he's not there."

Certainly not; for while his aunt was in the passage Edwin, rightly conjecturing probabilities, had emerged from his hiding-place and removed himself to the shelter of the cupboard, holding tight to the tongue of the fastening inside, resolved to hold on till he fainted should any attempt be made to storm his castle.

"Perhaps he's in the cupboard, miss?"

"No, Jane, I have looked already."

Mistress and maid left the room and went their respective ways down the front and back stairs.

Edwin, reassured that the coast was clear, came out of the cupboard, undressed, said his prayers, and went to bed.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER II.—COLIN'S CHARACTER AND SCHOOL LIFE.

COLIN McLEOD was a peculiar boy, but as "there is nothing new under the sun," and as therefore there doubtless have been, doubtless will be, and no doubt are at this moment, a great many boys more or less like him, there is no occasion for me to apologise for his peculiarities.

First and foremost, then, Colin was neither a big boy for his years nor a very robust one, nor was there any likelihood that he would develop into a very tall or very strong man.

Colin was a Scotch boy, and the son of a Scottish laird, one of the chiefs of a branch of a noble clan, the McLeods of Glenthora; but then all Scotch boys, or Highland boys, are not quite as you see them in the sensational pictures that sometimes grace the stories of—

"The land of green heath and shaggy wood,
Land of the mountain and the flood."

"I don't believe I can do it," said Colin, at last.

If you take these as types, then Colin's elder brother Roland was far more of a Scot than he, and a good thing for that youth he was, else the lads of the glen would have had but small respect for their young laird. Roland was his father's favourite, and, though not much over fifteen, followed him, gun on shoulder, over moor and mountain, often from three o'clock on a summer's morn-

ing until seven at night—for indeed there seemed no possibility of tiring either father or son. Between the two of them they kept the house well supplied with fish and game from one year's end to another, and that is all that either of them ever did.

Time was when all the land and all the lakes that could be seen from the peak of Ben Vawn belonged to the chiefs of the

McLeods of this particular ilk. *Tempora mutantur*, they did not do so now, and Roland's patrimony, when he succeeded to it, would be little more than a farm of average size, a heather hill or two to shoot over, a patch of pine forest and stream, and a tumble-down old building that once upon a time had been a castle, and might still be termed so by lovers of the antique.

But Roland's life was a happy one, if only for this reason—he was contented. Perhaps that was the reason also why he was so strong and hardy compared with Colin, for there were few lads of his age in the glen who could throw the heavy hammer such a distance as Roland, or compete with him successfully at “putting the stone” or “tossing the caber.” The sons of that gallant outlaw Rob Roy McGregor could, I am told by a scion of that line, bring down an eagle from the sky—though soaring around the sun—with a bullet, or drive a dirk clean through a two-inch deal board—and this, too, when mere lads; and even at such smart practice as that I believe young Roland McLeod would have run them hard.

To Roland's credit be it said, he was good-natured and kind-hearted, and he dearly loved his “little brother,” as he was fond of calling Colin.

Well, Roland would be laird, Roland would never leave the glen, but in good time marry and settle down in it, as the former lairds of Glenthora had done; but the world was all before Colin. He had his fortune to make, his career to cut and carve. The gentle lady-mother of these boys, whom both of them loved more than life itself, had laid her plans for Colin. She possessed that pride of birth or ancestry which is so common to this day among many Highland families, and, rightly or wrongly, she despised what is called “business.” No doubt Colin could succeed in business if he tried, but the very idea of his entering an office, or standing anywhere near a counter, was distasteful to her in the extreme. Well, then, there were the four professions—the Kirk, medicine, the law, and the sword. Of these Mrs. McLeod preferred the first-mentioned—mother-like; and her brother, Captain Peter, preferred the last—sailor-like.

Captain Peter—he was never called anything else—had left the navy on half-pay, and on a wooden leg, and settled down at the castle, and Colin was his especial favourite, and many were the friendly after-dinner debates between him and his sister as to what the boy should be; but as to Laird McLeod himself, he never interfered in the argument at all.

“You'll make something of the lad between you, no doubt,” he would say, laughing, “and I'm sure I can't do better than let you fight it out.”

In the meantime Colin—the bone of contention—was kept at school. The parish school it was, but my English readers must not imagine it was anything like the Government schools of southern Britain. No, for gentle and simple, all went to this school; the standard of education was high, and the seminary being connected with the Established Church of Scotland, as distinguished from the Free Kirk, the worthy dominie laboured hard to turn out better boys and better men than could be done by the other denomination.

There was a rivalry between the pupils or scholars themselves, too, which was not always so innocent, for the two schools often met on the field of battle, and combats sometimes raged night after night for weeks. In summer the lads fought with canes or wands, in winter with snowballs. It was great fun, upon the whole, and there was seldom any

harm done by either army. Blood was always hot on both sides, but not very often spilt.

In these contests young Colin McLeod was a hero, for strength was not so much required as courage and skill, and the boy possessed both in a marked degree; his personal prowess was of little account, but he made an excellent leader, and was never more at home than when in the battle's van.

But, alas! for his peace of mind, his schoolfellows forgot what they owed to their little captain almost as soon as the fights were finished. Internal dissensions were rife at this school. It was an unwritten law, but one which nevertheless was very binding, that every boy must take rank according to his physical abilities, and the big lads, I am sorry to have to record it, very often bullied the smaller, and beat them too; and it was probably quite as well in the long run if the weaker lads submitted to such treatment with all the grace they could command, looking upon it, in fact, as on the inevitable. But there were times when a small but spirited lad would throw off the yoke of allegiance, defy and conquer his burly oppressor.

“*Vae victis!*” or “Woe to the vanquished!” is an expression we constantly hear, but in this case matters were reversed—it was not woe to the conquered but woe to the conqueror, for the following is an example of what such a victory always entailed. Let B be a bully, and C, D, E, F, and G, five boys about his own size who are afraid of him, and who tamely submit to take a kick or a cuff whenever B, the bully, has a mind to give them one. Let H be a little hero, very much smaller than either B, the bully, or than C, D, E, F, and G, the boys who are bullied by B. Well, little H has long owned allegiance to B, but one day in the playground, finding himself rather much put upon, he turns upon his oppressor. He is as wild as a mountain cat, he has crossed the Rubicon, he has struck B the bully, and he cannot now retreat, so he showers his blows like wintry rain, and in less than five minutes, very much to his own surprise, he finds himself standing, out of breath and pale perhaps, but triumphant over the bully, who is prone on the playground, and pleading for mercy.

Ah! but H soon finds out that his is a dearly-bought triumph, for C, D, E, F, and G never looked upon H as their master, and never would, although they were submissive to B, and the mere fact of H's having conquered B does not make him king over them, so war is declared forthwith, and continues perhaps for a week and more, till poor H is so tired, so harassed and worried, that even B plucks up courage once more, and the small hero is deposed, and reduced again to the *status quo*.

More than once during his school career had Colin McLeod found himself in the position held by H as just described, for courage he never lacked, but strength—well, that had yet to come. Some might have thought that the fact of his being the son of a chief would have gained the boy some slight respect at this Highland school. Not a bit of it. Scottish chiefs gained their position in olden times by personal prowess and physical force, and their descendants fall very much indeed in the esteem of the clansmen if they are not able to sustain

by similar qualities the honour of the name bequeathed to them.

One of Colin's peculiarities was his fondness for retirement. He delighted in being alone. Now this was not a healthy trait in the boy's character; it was one he ought hardly to have fostered; it is one that is apt to grow on a youth, sapping the mainsprings of his life, and rendering him unfit to hold his own against the world, for it should be remembered that the great battle of life is carried on in the open, and that ambition which is only begotten in solitude can rarely be a true one. Ambition and work must go hand in hand. Youth is the season for activity, and a boy who wishes to do well in the world must be no idle dreamer. Let age

“fly concourse, cover in retreat
Defects of judgment, and the will subdue,
Walk thoughtful on the silent solemn shore
Of that vast ocean it must sail so soon,”

but youth must never think of rest and never dream of failure.

Well, Colin was a nervous lad, and mistrusted his own powers. He was hardly as yet lord of his own heart. Was it a faint heart? No, but as yet an untried one, and yet one thought that gave him infinite pain and sorrow was hardly ever absent from him in his solitary rambles—namely, the thought that he was not courageous. He would not call himself a coward; he did not believe he was quite so bad as that; and if conscience had applied the epithet to him he would have wished to die. He was fond of reading of all daring deeds by sea and by land, but as he did read this question was always cropping up in his mind: How should I have behaved under such circumstances? And the answer he was compelled to give was invariably a painful one.

Now, think you, reader, that heroes good and true can be made from such material as you can judge from what I have said Colin McLeod was composed of? I say they *can*, and *are* every day, so let nervous lads take heart of grace. And this is true: the bravest men are those who can see the danger of a situation they may be called upon to face, but who face it nevertheless.

Rough though the school at which Colin received the groundwork of his education, it was a useful one. He learned many a lesson even in its playground.

Honest Duncan Robb, the keeper's son, humble though he was, had ever proved a friend of friends to Colin. This lad could see all Colin's good points, and many an encouraging little lecture he used to give him, for there was a great deal more in Duncan than his rough and humble exterior could have led one to imagine. His very love for his foster-brother it must have been that prevented him from seeing his faults, or if he did see them he thought with himself, “He'll grow out of all that,” and so he said nothing about them.

But Duncan gave his foster-brother some useful lessons as well as lectures. He taught him to climb, a very useful accomplishment for a boy who is to be a sailor, and at the time our story opens there was no tree in all the forest too tall for Colin to get to the top of; sometimes, indeed, while swaying about among

their uppermost branches, he looked, as Duncan said, "no bigger than a magpie."

He taught him to swim. His method of tuition was a peculiar, not to say dangerous, one, and while we record we do not recommend it. He perfected Colin in all the motions and movements of natation on the bank of the loch, then he swam straight in with him into deep water—not telling him what he was about to do, of course—then simply shook him off. The dark waters seemed to close over Colin's head, and shut out the world and everything in it. Then it suddenly occurred to him that he was drowning; this made him kick and splutter as a puppy would; but it immediately after occurred to him to go through the motions that Duncan taught him; he did so, and presently found himself swimming. His foster-brother had been close by his side all the time.

Many months after this, on a beautiful summer's day, making a bundle of their clothes and strapping them on their shoulders, the two boys swam out to an island some distance from the shore. They fished for some hours, then went into the interior to eat their lunch of bread and cheese and enjoy themselves. Colin, lying on the grass, pulled out one of Kingston's stories and commenced to read aloud. He read and read, and Duncan lay and listened entranced. And thus

"The time flew by wi' tentless heed,"

till at last they both awoke to consciousness of the fact that the sun had gone down and that the wind had got up.

They had quite a long way to swim, and the surface of the lake was very rough indeed. The wind was in their favour, that was one good thing; but for all that Colin's heart seemed to come disagreeably near to his mouth as he gazed away over that dark and stormy water to the shore that looked such a long, long distance off.

"I'll never be able to do it," he said to Duncan.

"You never know," replied Duncan, "what you can do till you try."

"Come on," cried Colin, "I mean to try."

"Spoke like a McLeod," said Duncan; and next moment they were both together, shoulder to shoulder, buffeting the waves.

The water felt terribly cold at first,

almost paralytically so, but they soon warmed to their work, only the water constantly broke over their heads and prevented their breathing or seeing with freedom.

There was no talking, the work was too serious, only Duncan found time now and then to splutter out a word or two of encouragement.

But it got nearly dark before the distance was much more than half accomplished.

"I don't believe I *can* do it," said Colin, at last.

Duncan's reply was very brief. It consisted of but one word—"Fiddlesticks!"

Presently, however, he turned towards his foster-brother and said, kindly,

"If you really are getting tired, you know, lean a hand on my shoulder."

But Colin McLeod said "No, not for all the world."

Ten minutes after they were both dressed and laughing at the danger they had just come through.

"But," said Colin, "I'm so glad I didn't accept assistance."

Colin's uncle looked somewhat serious when told of the exploit, but he presently smiled.

"Duncan is a bold but a good lad," he said. "I'll do something for him if I can. He has given you a lesson, though; don't forget it. Life is all before you just as the dark and troubled waters of Loch Leean were. Fear life and its troubles no more than you feared the loch. Brave it, battle with it, buffet with it, and you are sure to be successful."

Captain Peter worked away quietly, and was finally successful in getting the boy a cadetship in the Royal Navy. Then, and not till then, did good Mrs. McLeod give in, for she was, as many Highland ladies are, somewhat of a believer in destiny; so all she said to her brother when he brought the to him "glorious" news was, "Well, dear brother, what will be must be. Perhaps it is for the best. I will not venture to oppose what may after all be the workings of Providence."

But there were tears in the dear lady's eyes when she added, "May Heaven in mercy watch over my darling boy, and guide him safely through every danger."

"Amen! Amen!" said Captain Peter, heartily. Then he pressed his sister's hand and hobbled joyfully away to meet young McLeod.

When, next day, Colin told the news to his foster-brother the effect upon him was very wonderful indeed, and to many would have seemed inexplicable, for first of all he flung his Highland bonnet high in air with a wild Highland "Hooch!" that resounded through the forest, and startled even the wild deer; then, as soon as the bonnet came back to earth, he leapt nimbly on top of it, and cracking his thumbs in true Scottish fashion, danced six steps of the Lonach fling thereon before ever he drew breath. After that he grew sad all of a sudden.

"It is no use," he said, drawing his sleeve rapidly across his face. "I'm ashamed to shed a tear, but—I cannot help it. Heigho! I'm going to lose the only one I love in all the wide world."

And Duncan threw himself face downwards on the grass, his intention evidently being to succumb to his feelings and indulge in the unwonted luxury of a cry. But no sooner was he down than he sprang to his feet again, his eyes sparkling with excitement and determination.

"I had forgotten! I had forgotten!" he exclaimed. "I'll join the marines, as you proposed. I will."

Colin went back to school for a few weeks, but the news went there before him, and when he entered the playground on that Saturday morning, rough and uncouth in many of their ways as they were, the lads all gathered kindly around, and many a not over-clean hand was held out to grasp and shake his. Even the big lout whom the goat had pitched over the stream came up.

"Let bygones be bygones," he said. "Mind I *did* mean to give you *such* a thumping this very day. That brute of a Billy gave me a fearful fling. I shan't be able to sit down fair and square for a week, but— You're going to leave us. There, shake hands."

Well, Colin made a great many mistakes that day in his Latin epitome and exercise; plural nominatives took singular verbs, active verbs governed ablative cases, nouns in "um" were content with adjectives in "a," and gerunds in "dum" impudently usurped the places of gerunds in "do." But for all that the tawse rested quietly in the desk; it was never even once appealed to; and the blue eyes of Dominie Clayton beamed mildly over the gold rims of his spectacles on the pupil he was so very soon to lose.

(To be continued.)

THE STORY OF MADAGASCAR.

THE French attempts to possess themselves of Madagascar have brought the island into considerable prominence; and this, with Admiral Pierre's ill-advised imprisonment of Mr. Shaw, for which the French Government apologised and paid damages, will ensure for our energetic missionary's interesting book, just published by the Religious Tract Society, a cordial reception.

Madagascar is to most people an unknown land, and the literature regarding it is not extensive. The new book, "France and Madagascar," has therefore almost the field to itself, and as the information, historical and scientific, is brought up to the hour, the book is sure to be welcomed by a large circle of readers, not the least proportion of whom will be those interested in mission work, of

which so much has been done among the Hovas and their dependents.

It is indeed something to be proud of to find that the island has a Christian Queen, that converts can be numbered by thousands, that the London Missionary Society, the Friends' Foreign Missionary Association, and the Society for the Propagation of the Gospel have between them in the island 859 schools and 108,037 scholars, and that the work of education is by the Queen's orders in no way interfered with by the hostilities.

Very little is known of the history of Madagascar. Between the island and the African continent there is a deep channel, and from this and other reasons it is assumed that it has never been connected with the continent of which at first sight it would seem

to form part. There is such a difference between the character of its life and that of the mainland that early communication is most unlikely. Its existing population have come at different remote periods from the east, and are of the same stock from which the Malays and Malayo-Polynesians have sprung.

A dark race drove its predecessors into the interior; the Hovas came afterwards, lived some time near the coast, and when powerful enough drove the Vazimba out of Imerina and there settled. The landing of the Hovas is calculated to have taken place about the time of our own Norman Conquest from the number of the monarchs of the race who are remembered to have reigned.

Madagascar, like many other lands, pos-

sessed no written language until the missionaries began their work. It was they who reduced the words to writing, and it is to them that we are indebted for the ortho-

graph. It is assuredly a pity that there are no means of sprinkling in a few capitals so as to cut up her Majesty's name into short lengths!

The French have had their eyes on the island ever since 1643, when their Eastern Company took possession of it in the name of the King of France; but it had already been discovered by Suarez, the Portuguese, in 1506, and he had founded trading stations on its coast. Tristan d'Acunha also landed in Madagascar, and under King Emmanuel an exploring expedition, commanded by Lopez de Figueira, was sent to report on its treasures. The Dutch also had some stations on the island for a time; and so did the English,

ever shadowy, came to an end. At the peace of 1814 we gave back Bourbon to the French, and handed over all our stations in Madagascar to the reigning king on condition of his abolishing the export slave trade. In 1823 the French made another attempt to get a footing in the island, but the natives were too strong for them. In 1829 an expedition led by Gourbeyre was sent against Madagascar, to return defeated.

A Malagasy Beggar.

Musical Instruments.

graphy. The letters having our ordinary full sounds, there is little difficulty in pronouncing these words, unless, as in some Polynesian dialects, they are of undue length. Madagascar has, however, such an unfortunate pre-eminence in this matter that it requires some effort to take an interest in its political history. The names of the monarchs are almost appalling. It requires a bold heart for instance to devote much attention to Queen Radodonandrianampoinimerina, and

who were swept off by the deadly climate of the beautiful St. Augustin's Bay.

The only serious attempt at French colonisation was made by Benyowski in 1774, but he was unsupported, and the French possessions remained for years limited to the Isle of St. Mary—one of the wettest spots on the earth, with 230 rainy days in the year. In the great war the British cleared the French out of Madagascar and all the islands of the Indian Ocean, so that all their claims, how-

intriguing, began again in 1840 to procure some of the sub-chiefs to sign a treaty that might be used as a fulcrum to lift the Hovas; and that unsuccessful intriguing has gone on ever since, and we have had the recent bombardment of open towns as its results. So offensively insolent was the conduct of the French admiral that at one time the Dryad had her guns cleared for action, and it was only with the greatest difficulty that Admiral Pierre was dissuaded from bringing on a conflict between his fleet and the English sloop, that might have landed us in a serious war.

Mr. Shaw gives a full account of all these matters, and tells how he was seized on shore and hurried on board the *Nievre* as a prisoner, and how the charge that had been trumped up against him of his being a belligerent, owing to a bottle of laudanum having been found amongst his stores when his house was pillaged, was eventually abandoned. He also tells the story of his treatment in prison, when his food was served in a bucket, without knife, fork, or utensils. To those who care not for these things political, his book appeals on account of its terse and graphic notes on natural history, and to this division of it we now turn.

Madagascar is the land of the Lemurs. Some thirty-three species have up to the present been discovered, thus forming almost half the number of the mammalia in the island. "Some of these lemurs are of large size, standing three feet six or four feet, such as the *Indris* and the Black Lemur of the Betsileo; while others, such as the *Microcebus Smithii*, are not more than four inches from snout to root of tail. They, generally speaking, inhabit the forest region, where their piercing cries or long mournful wails can be heard for miles in the otherwise quiet and apparently lifeless solitude. As the various species are unlike in appearance and size, so they are unlike in habits. Some are diurnal, others nocturnal, of every shade of colour, from the purest white to the intensest black. Some feed entirely upon fruits and berries; others enjoy, if they do not wholly subsist on, insects, spiders, beetles, and moths. Some

The Tombs of the early Missionaries and of Mr. Cameron in Ambatonakanga Churchyard, Antananarivo.

have long bushy tails; others smooth round ones; others have no tail at all. Some have long claws; others have smooth, soft, flat hands. Some are gentle, easily trained, and used as pets by the people; while others are savage, repulsive, and very difficult indeed to tame."

In regard to the fauna and flora of the island, some of the facts given by Mr. Shaw are most curious. As an instance we may quote the following as to the captive snakes: "It is no uncommon thing in the south central part of the island to find in the lowest chamber of the ant-hills one of the light-coloured snakes that abound on the prairie land. Whether the creature creeps in at the entrance and makes its way into the warm and dry spot to sleep off the effects of his last meal, or whether it is a nursling of the ants, has at present not been satisfactorily proved. I can only witness to having discovered them in such a place, but it would be difficult without keeping constant watch to ascertain whether the snake has free ingress and egress from what the natives say is its prison. The tradition of the people is that the ants keep the snake as a captive, providing it with plenty of food, until it is fat and in good condition, when they kill and eat him. There is, however, a great difference of opinion as to how the snake first gets there. Some think it is carried there when quite small; others that these sagacious ants make regular snake-traps in the lower part of their nests, which are two or three feet high, from which, though easy to enter, it is impossible for the snakes to escape. When it is remembered that the ants take care of and feed the aphides for the sake of the sweet honey-like exudations from their bodies, one is led to give some credence to a statement so universally accepted by the natives."

Some of the huge animals of the past are still believed to linger in the forests in the

islands in latitude 8 deg. south; and although usually accepted as an extinct animal in

• The Brown-Mouse Lemur.

unexplored interior. On this subject Mr. Shaw says: "M. Grandidier discovered the half-fossilised remains of two species of tortoises of gigantic size, identical with those found in the desolate Aldabra group of

Madagascar, it is reported by the natives to still live in the forest land on the west. One was kept in a garden in Tamatave two years ago, which was said to have been brought from the west coast, measuring over four feet in length, without the head and neck, and somewhat broader. This was smaller than those from the Aldabra in the Zoological Gardens, one of which was nearly six feet broad, weighed over eight hundred pounds,

The Lace-Leaf Plant.

The Pitcher Plant.

and was able, it is said, to carry a couple of tons on its back."

But it is in the birds that we come nearer home: "The bones of an enormous bird, supposed to have lived in the island less than two hundred years ago, were found by M. Grandidier in the southern part of the island. He formed a skeleton from the materials to hand, and by deductions therefrom we get the representation of a bird considerably larger, but of the height of an ostrich. This is doubtless the *ruk* referred to by Marco Polo in the account of his voyages. Grave doubts have long been cast upon that traveller's veracity regarding this matter; and his gigantic bird had been classed with the Arabian *roc*, as equally of imaginative origin. Other remains have since been found, and Professor Owen supposes the *Epyornis* to have been a struthious or terrestrial bird of the same genera as the *Dinornis* of New Zealand. Many travellers have worked hard to discover a complete skeleton, but hitherto nothing has been found but a few bones, and the eggs. Many of the latter are more or less broken, some when discovered were being used as water-pitchers by the natives; but some have been found entire. One I saw in the possession of a merchant in Bourbon was without the least flaw, and sixteen inches in length."

Of the forest scenery we have many pleasant glimpses: "In travelling in the Betsileo and along the east coast I have often been struck with the variety of bird life near the lakes and rivers. Some on the water, others hovering over it, waiting for their prey, some wading in the shallows, or stalking along from one lily-leaf to another, assisted by their large and wide-spreading feet. There are the large Muscovy ducks (*Sarcidiornis Africana*), frequenting the inland marshes of the central and south central provinces, with the duck (*Anas Melleri*) and little grebe (*Podiceps minor*) on almost every rushy stream, furnishing abundant sport for the sportsman and good food for his bearers. The wild ducks are not in the least fishy in flavour, but rich and gamey, proving quite an addition to the not remarkably varied character of the dishes procurable in the island. There is also a beautiful waterhen, with black plumage, but scarlet head, which enjoys the home of the above, although not their distinction at the table of the foreigner. It is called the *otrika* by the people. There are three or four kinds of ibis found in the island, the crested variety being peculiar to the country. It is found in the north-east, and is there fairly abundant. It is scarlet on the body, with long legs, yellow beak and claws. The so-called sacred ibis of Egypt is found in large flocks. A white egret is a very common gregarious bird, living near the rice-fields, about which it walks in search of food, or it follows closely after the herds of cattle, which attract the insects that to a great extent constitute its food."

The entomology, too, comes in for due notice: "The insect life of the island is prolific, specialised, and often very beautiful. Among the *Lepidoptera* are some magnificent specimens of gorgeous colouring and variety of form. The most remarkable is one that has frequently been described, the *Urania riphæus*; that is found principally in the upper part of the eastern forest belt; its dazzling mixture of blue, green, gold, and red renders it a conspicuous object as it flies lazily across one's path. Very many of the butterflies are more remarkable for their peculiar shape than for their beauty of colouring, imitating the dead leaves to such a nicety as to deceive the casual observer. They close their wings against each other, and one fancies he can see the midrib and veining of a dried leaf standing up from the dead branch, in colour dark brown slightly mottled with black, while the upper side of the wing presents a bright and gaudy colouring. In the interior the butterfly called by the natives the lime-tree butterfly, a large

yellow-and-black variety, is a very common object, as it flutters about through the lime and lemon trees, seeking suitable spots to deposit its eggs. In some places in the forest the small streams seem to be literally alive with butterfly and moth life. There are also several very large nocturnal moths; one found on the east coast is six or seven inches across the spread of the wings, of a light pinkish drab colour, with little square transparent spots on each wing. One found on the west coast measures eight inches and a half from shoulder to point of tail, and eight inches across the upper wings. But its most extraordinary characteristic is the formation of the long delicate tail-like appendages to the hind wings, which have extremely narrow shafts and are enlarged at the ends; their points have two spiral twists or folds, graceful in appearance. There are four distinct eye-like spots near the centre of each wing, which are of light-buff tinged with lemon-yellow. The buff-coloured body is two inches and a quarter long. It is proposed to be called *Tropæa Madagascariensis*."

The spiders, too, from the large *Hala-be*, like a black-and-yellow crab, to the poisonous *Hala-mena-vody*, are duly described, and the trapdoor gentry receive the customary attention. "But another genus makes a most ingenious trap for ants and woodlice by throwing up the loose sand in which it lives so as to form a cup-like hollow. At the bottom of this it lies concealed, waiting for any luckless ant that may fall into the trap, from which it seldom escapes, because the sides of the hollow are composed of such loose sand that no foothold can be found, and the disturbance caused only helps to attract the enemy and confuse the victim. These cups are about three inches in diameter at the top and an inch and a half deep, and are made by the insect working in a small circle just under the surface, and throwing up the sand from the centre with a twitch of the tail, which is half the length of the body. So strong is it that with very little difficulty it can throw out any substance twice or thrice its own weight to a distance ten or twelve times its own length. These nests are always made under cover where the sand is light and dry, and it is astonishing how quickly these insects will repair or re-make an injured or demolished trap. I have kept some in confinement, supplying them with food from time to time, and their diligence and perseverance might point as good a moral as those qualities in the ants which they prey upon."

Varied and strange as is the animal life, it yields in interest to the flora. After suggesting that the long-spurred *Angræcum sesquipedale* is fertilised by ants, and not by a moth with a long proboscis as hitherto stated, Mr. Shaw proceeds: "Of all the many beautiful varieties of vegetable life in Madagascar none are more attractive, from their delicate perfume and the purity of their colour, than the orchids, of which there is a great variety in the country. The flowers like wax shining out star-like amid a dense cluster of dark-green leaves, perched in the forks of branches, or springing from the protruding roots of the smaller trees and bushes, present a picture not easily erased from the memory. The *Angræcum Ellisii*, brought to this country by Mr. Ellis, is still, and justly so too, a great favourite. Its large cluster of butterfly-like flowers, each with a spur seven or eight inches long, when in full bloom is a splendid sight. The *A. superbens*, to be met with in such profusion among the bushes on the coast, has a spur of flowers two feet long, and exhales a beautiful fragrance. Many of the orchids in the island are still unnamed, and only a few comparatively have found their way to England alive. I had the opportunity of seeing in Tamatave a splendid collection growing in the ground of a French collector, among which were thousands of specimens, of all sizes and of various colours—white, white and yellow, yellow, yellow striped with red, brown and gold, mauve and

white, purple, etc., presenting as gorgeous a show of flowering beauty as it is possible to conceive."

But our extracts have run to undue length, and with one more we must close our notice of Mr. Shaw's most excellent book: "Among the curiosities of the plant life on the east coast should be mentioned the three most notable. The sensitive plant, growing in abundance about one hundred miles south of Tamatave, is a conspicuous object, with its delicate flowers, resembling tufts of pink threads, and its highly sensitive leaves and leaf-stalks. When touched the leaves immediately fold themselves up, and then the leaf-stalk falls, almost hiding the leaves under the branches of the plant. The pitcher-plant also grows in the marshes along the east coast, but generally out of sight among the rushes and sedges at the water-side. At the end of each leaf, which narrows to a mere stalk at the tip, it carries a vase-like excrescence, very much resembling a pitcher, with lid and all complete. This pitcher seems provided for the purpose of keeping the leaves well supplied with moisture, as I have frequently found them with a considerable quantity of water in these receptacles. The lace-leaf plant, the other curious plant to which reference is made, has frequently been described. In the rivers west of Tamatave great quantities of this fresh-water yam may be seen sending its two-forked flower just above the eddying of the water, in which it bobs backwards and forwards in a fantastic dance. The root is edible, but the interest of the plant centres in its leaves, which are about eight to fourteen inches long, and resemble a square-patterned lace, or a skeleton leaf with parallel veining, the whole space between being empty. These are supported on stalks two feet or three feet long, just sufficient to raise the leaf to the level of the water. For many years it was thought to be confined to Madagascar, but since the time that Mr. Ellis first made the scientific world acquainted with the strange *Ouvirandra fenestralis*, it has been discovered that plants somewhat similar have been growing in other parts of the world."

THE CRICKET SEASONS OF 1884 AND 1885.

(Continued from page 448.)

KENT lost half their matches and won only four, two of the wins being over Derbyshire, the others being over Lancashire at Manchester, and over Surrey at Maidstone, when Lord Harris won the toss and put his opponents in first. His lordship was the mainstay of his county. His batting was remarkable, his 44 out of twenty-three innings being the highest county average of the year. In Wootton, Mr. Christopherson, and A. Hearne the side had three excellent bowlers, and it will probably give a good account of itself in 1885. The Canterbury week, which opened last year with the match against the Australians that resulted in so notable a victory for the home team, will be occupied by Kent and Yorkshire on the Monday and by Kent and M.C.C. and G. on the Thursday.

Gloucestershire won a match. Everything that could tell against the team seems to have occurred during the season. Their captain damaged his finger, and then sprained his leg, so that he had to play henceforward tightly bandaged. Their only bowler split his hand, and a death caused the abandonment of one match, and the retirement of the chiefs of the team from two. Out of twelve matches seven were interfered with by accidents, so that the record is not so bad as at first sight it would seem. Gloucestershire, like Middlesex, is in sore need of a bowler and a more constant eleven. It has too much variety in its tail. The county, like Kent, has its "week;" in this case at Cheltenham, com-

mencing on August 17, the first match being against Sussex, the second against Surrey.

Of Derbyshire, that never wins or draws a match and never even wins a toss, the best that can be said is to wish it better luck next time. In its matches with Cheshire, Hampshire, and Essex it may discover some rising talent to improve a record that has been very dispiriting for some years past.

With Derbyshire we end the first-class counties. Other counties there are striving to enter the magic ring, some of them of very promising strength and worthy of more respect than has been hitherto accorded them. Cheshire, Durham, Essex, Hampshire, Hertfordshire, Leicestershire, Norfolk, Northamptonshire, Northumberland, Somersetshire, Warwickshire, and Worcestershire have all properly organised elevens, and all played a fair number of matches during the past year. And in 1885 we shall have Cheshire, Essex, Hampshire, Leicestershire, and Somersetshire contending with first-class counties, although not reckoned in their average list.

The great matches need not detain us long. Gentlemen and Players at the Oval in 1885 takes place on July 2, and at Lord's as usual four days afterwards. Last year's Oval match was won by the Players over a poor team of Gentlemen; the Lord's match was won by the Gentlemen over a strong team of Players. In this match 1000 runs were scored for four wickets. The Players made 290, out of which 94 were due to Ulyett; the Gentlemen headed them by six, Lord Harris scoring 85 and Mr. W. W. Read 67. The Players then made 209, out of which Bates claimed 72 and Ulyett 64, and left the Gentlemen 204 to get to win. Of these Messrs. Grace and Steel when in partnership scored 137, and the number was obtained with the loss of four wickets—Grace 89, Steel 63, Lucas 6, and Lord Harris 0, the not-outs being O'Brien and Read. The four innings thus stood at 290, 209, 296, 205—a somewhat level array.

In more popular cricket, Oxford beat Cambridge easily, and Eton and Harrow, still hovering over the twenty-five wins apiece, were unable to finish the match. May the elements be as kind to them in 1885 as they generally are to the Universities, which have not known a draw for the last forty years. The University match is fixed for the 29th of June, the Eton and Harrow match for the 10th of July.

And now for the individual performances. In first-class matches there were a dozen scorers of over a thousand runs. Dr. W. G. Grace still heads the list, this time with an average of 34 out of 1361, Lord Harris coming second with 33 out of 1471. Of the other scorers over a thousand we have Barnes, Bates, Hall, T. C. O'Brien, W. W. Read, and Ulyett, and the Australians, Bonnor, Giffen, McDonnell, and Murdoch, with whom we are not now concerned. Ulyett, with a total of 1334, has an average of 29; Mr. W. W. Read, with a total of 1256, has the same. Barnes's average was 29, Mr. O'Brien and Louis Hall have each 27, Bates has 23. Of the scorers under a thousand, Mr. A. G. Steel comes first with a total of 967, and a splendid average of 38. Scotton's average is 34, Mr. Mackinnon's 33, Mr. Newham's 32, Mr. Blackman and Mr. I. D. Walker each claim 28, the Hon. Alfred Lyttleton, Mr. W. H. Patterson, Mr. J. Shuter, and Mr. C. T. Studd have each 26.

The season having been an exceptionally fine one, the bowlers who delight in miserable weather had rather an unfortunate time of it. The best of the year were Shaw and Emmett, the first with 71 wickets at a cost of 10 apiece, the other with 107 wickets at 11 apiece. Peate with 137 wickets for 13 each, and Attewell with 101 wickets for 12 each, were perhaps next in merit, while Barlow, Barratt, Wootton, Woof, and Mr. Horner each obtained over the coveted hundred wickets, Mr. Horner's record of 14 being by

far the best of the amateur performances. Dr. W. G. Grace's average was 21, Mr. Christopherson's was 22.

Dr. W. G. Grace heads the list of centuries with no less than seven scores of over a hundred, three of them against the Australians. There were five scores of over three hundred runs due to Messrs. Bruce, Dumbleton, Holms, Shuter, and Howard. Mr. Holms's 303, not out, was for Blair Lodge against Campsie. Mr. Shuter's 304, not out, was for Bexley against the Emeriti, when he and Mr. Ashdown went in at twenty minutes to three and remained till the stumps were drawn at half-past six. Mr. Ashdown made 62, and there were 36 extras, so that three hours' cricket yielded 402 runs.

Of the two-hundreds there were forty, one of them, Shrewsbury's, made in a first-class match. Mr. Bettesworth played a 203 not out innings for Blair Lodge against Stirlingshire; Dr. E. M. Grace scored 219 for Thornbury against the Bristol Medicals; Mr. M. C. Kemp scored the same amount for Hertford against Trinity College, Oxford; Mr. F. E. Lacey scored 211 for Hampshire against Kent; Mr. D. Q. Steel scored 226 for Liverpool against Sefton; Mr. A. J. Webbe scored 214 for the Free Foresters against the Aldershot Division; and Mr. S. D. Maul scored two two-hundreds—one of 284 and another of 235. Fine weather means hard grounds, and hard grounds mean long scores. It is therefore not surprising to find the century list of 1884 of unusual length—nearly eight hundred scores exceeding the hundred having been recorded. Of these Barlow claims three—two for Lancashire against Cheshire and Leicestershire, and one for the North of England against the Australians. Barnes has two—one for M.C.C. and Ground against Australians, and one against Suffolk. Bates has three—two for Yorkshire, one against Notts and one against Cambridge University, and another against Cambridge University for Mr. Thornton's eleven. Mr. J. H. Brain has three—one for Gloucestershire against Australians, one for Gloucestershire against Surrey, and one for Clifton against Lansdown. Briggs has three, Mr. F. W. Bush has four, Mr. J. T. Day has four, Mr. H. F. Fox has four, Mr. W. R. Gilbert has three, Mr. Greatorex has four. Gunn has four—two for M.C.C. and Ground, one for Notts against Sussex, and one for Notts against Middlesex. Hall has four—all for Yorkshire against Kent, Sussex, Middlesex, and Cambridge University. Lord Harris has four—for Kent against Hampshire, for Kent against Derbyshire, for Kent against Sussex, and for East Kent Yeomanry. Mr. Newham has three—two for Sussex, one against Yorkshire, and one against Kent. Painter has two—one for Gloucestershire against Lancashire, the other for Gloucestershire against Surrey. Mr. A. Payne has three, Mr. E. O. Powell has four, Mr. O. G. Radcliffe has three, Mr. W. W. Read has three—one for Surrey against Leicestershire, one for Surrey against Gloucestershire, one for England against Australians. Mr. C. Roberts has four, Mr. W. N. Roe, of long-score fame, has three, and Scotton has three—one of them against Middlesex, another against Australians. Captain Spens has four, Mr. G. D. Spiro has four, Mr. A. G. Steel has four—two of them against the Australians; and Mr. H. B. Steel has four. The Rev. R. T. Thornton has five, Ulyett has four—two for Yorkshire and one for the Players; and Mr. J. G. Walker has four.

Leaving the individual scores for the totals, we find the largest completed innings of the year to have been 674, compiled by the Royal Engineers against the Royal Marines. Hampshire's score of 645 against Somersetshire is also worthy of note. For incomplete innings the palm must be given to Gravesend, who scored 676 for nine wickets against Town Mallings, where in days of yore Fuller Pilch used to live. Another extraordinary score was the total for five wickets

of 665, obtained by Sheffield Park against Mr. Ellis's team; another, the 544 for two wickets obtained by Caius College against Magdalene. As a sample of small scoring we may instance the collapse of the Radcliffe Wesleyans before the men of Bingley—they only got one run, and that was a bye! Of curiosities there were the usual assortment. Three family elevens had their deeds recorded—eleven Christophersons, eleven Wallgates, and eleven Waterfalls. At Worcester College there was a match between two blind elevens, in which the ball was a bell in a wickerwork case, and the bowling and batting were guided by sound!

OUR NOTE BOOK.

THE UNION JACK.

This well-known flag was called "Union" because it represented England, Scotland, and Ireland; and "Jack," because James, or Jacques, brought those three shields into one. It therefore means "the union established by James." The royal standard was the first of all our flags, and properly ought only to be hoisted when a member of the Royal family is present. The Union Jack came next; it was made up of three crosses, which respectively represented the three countries. England had the cross of St. George, which was red on a white ground; Scotland had a white cross on a blue ground; and there was also the red cross of St. Patrick for Ireland. —Rev. J. King, M.A.

THE TRAVELLING PLANT.

To the number of curious plants already described and illustrated in our pages, such as the carnivorous and fly-catching plant, a new specimen has lately been added which is described as the travelling plant. It is said to be of the lily of the valley species (*Convallaria polygamatum*), and has a root formed of knots, by which it annually advances about an inch distant from the place where the plant was first rooted. Every year another knot is added, which drags the plant farther on, so that in twenty years' time the plant has travelled about twenty inches from its original place.

THE BOOKMARK.

A correspondent of a foreign journal relates the following: A young lady once presented me with a bookmark, having the inscription "God bless you!" and exacted a promise that it should be placed in my Bible, but never to remain a day opposite the same chapter. Faithful to my promise I took it home, and, rubbing from the lids of my Bible the dust of a week, I placed it in the first chapter of Matthew, and daily read a chapter and changed its place. I had not read long before I became interested as I had never been before in this good book, and I saw in its truths that I was a sinner and must repent if I would be saved. I there promised God that I would seek His face at the earliest opportunity, and if He saw fit to convert my soul, I would spend my life in His cause. It came; I sought His face and received the smiles of His love, and now I have a hope within me big with immortality; and all do I attribute to that bookmark and the grace of God.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Writing Competition.

MIDDLE SUBDIVISION (ages 16 to 18).

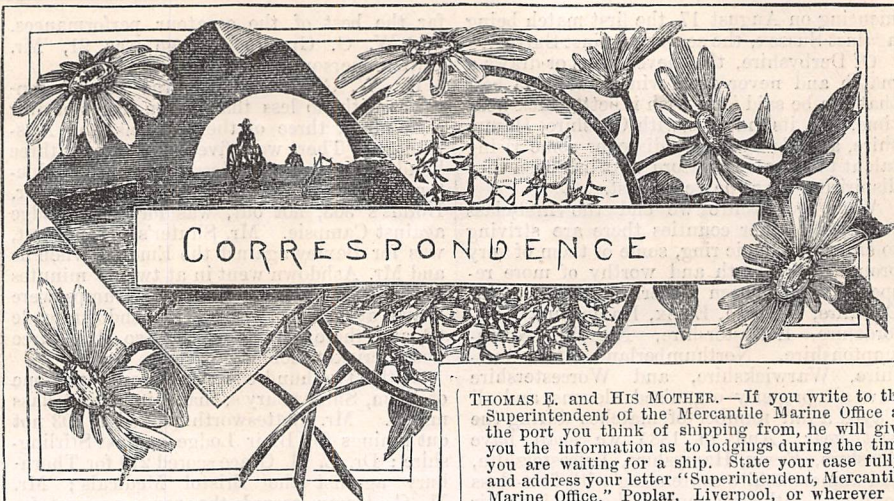

Prize—One Guinea.

ARTHUR G. LEIGHTON (aged 17), Rosemount, Blenheim Road, Nottingham.

Certificates.

C. W. HARRIS, West Ludworth Villa, Neath.

CHARLES JENKINS, Nestor's Square, Narberth.
 JOHN EASTON, Union Road, Inverness.
 GEORGE S. COOPER, 1, South Howard Street, Great Yarmouth.
 W. DOUGLAS HALL, Victoria Terrace, Walmersley Road, Bury, Lancashire.
 JAMES R. ARROWSMITH, 7, Chesnut Street, Darlington.
 WALTER R. SIMMONDS, New Romney.
 WILLIAM DALTON, Cedar Bank, Hawthorn Lane, Wilmslow, near Manchester.
 FRANK S. WALKER, 16, East Norton Place, Edinburgh.
 CECIL C. PICKERING, 153, Church Road, Islington, E.

OLD BOY.—You can know nothing whatever about the paper, or you would have seen the four coloured plates and long series of signal articles, that almost exhausted the subject which you wish to have "something said about."

WALLINGTON HARRIERS.—We were pleased to hear of your paper-chase, but it does not come within our plan to give reports of such matters. They would be so woefully out of date.

ELECTRICAL.—You could get a cylinder for an electrical machine from any chemical appliance seller. Buy a number of "Nature," the "English Mechanic," or "Science Gossip," and consult the advertisements.

SAILOR.—The price of Mr. Dixon Kemp's "Boat Sailing" is twenty-five shillings. It is published by H. Cox, Strand, and gives a complete description of all the usual rigs, and the ways of working them.

B. A. CLARK.—1. With the exception of the Great Eastern, the largest vessels now afloat are the Umbria and the Etruria, belonging to the Cunard line. They are sister ships, forty feet shorter than the City of Rome, but five feet broader and four feet deeper. Their length is five hundred and twenty feet, breadth fifty-seven feet, depth forty-one feet. Their tonnage is over eight thousand. They are of fourteen thousand horse-power, carry five thousand tons of cargo and two thousand five hundred tons of coals, and steam nearly twenty knots an hour. Their main saloon is nine feet high and seventy-six feet long. 2. The standard gauge of Britain is 4ft. 8½in. The broad gauge on which the Great Western started was 7ft. The Festiniog Railway has a gauge of only 1ft. 11½in. The Irish gauge is 5ft. 3in. In the United States the gauges are 3ft., 5ft., 5ft. 6in., 6ft., 4ft. 9in., and 4ft. 8½in. In South Australia they are 5ft. 3in. and 3ft. 6in. In Queensland the gauge is 3ft. 6in.; in New South Wales 4ft. 8½in.; in Victoria 5ft. 3in.

CANAILE.—1. An inch of rain means one hundred tons of water on every acre. 2. The China Canal is 1,000 miles long. The Languedoc Canal, cut in 1681, is 148 miles long. The largest ship canal in Europe is the North Holland, from Amsterdam to the Helder, 51 miles. The Caledonian Canal, including the lakes, is sixty miles long. Some of the American canals are rather large. The Erie is 350½ miles long; the Ohio, from Cleveland to Portsmouth, measuring 332 miles; the Maine and Erie, from Cincinnati to Toledo, 291 miles; the Wabash and Erie is 374 miles.

A. O. C.—1. Jeweller's solder is said to consist of nineteen parts of fine silver, one part of copper, and ten parts of brass. The hardest solder is made of four parts of silver and one of copper. 2. There is a treatise on soapmaking in Spon's "Workshop Receipts," first series.

V. R. G.—There is no difficulty in making diagrams from woodcuts if you have a magic-lantern. Trace the picture on a piece of ground glass, and then, using the glass as a slide, throw the image on to a piece of paper hung on the screen, and copy it there. You can enlarge it to any size you like, and all the parts will be in proportion. Another plan is to use the pantagraph described in our fifth volume.

COLONIST.—Hardly any occupation exists of which such startling statistics could not be compiled. Even a compositor setting type has been reckoned up, and it appears that one Michael Quin, of the Erie "Daily Herald," has handled 358,020,000 pieces of metal twice over, that the metal so lifted would weigh ninety-four tons, and that in setting it in position his hand has travelled 516,000,000 feet, or 97,727 miles, or nearly four times the circumference of the globe!

W. F. T.—The "face value" of a bond is its nominal value as distinguished from its market value. A "bounty" is the premium manufacturers receive from Government in encouragement of their special trade.

RAVS.—You will find an article on early cricket in the second volume.

THOMAS E. and HIS MOTHER.—If you write to the Superintendent of the Mercantile Marine Office at the port you think of shipping from, he will give you the information as to lodgings during the time you are waiting for a ship. State your case fully, and address your letter "Superintendent, Mercantile Marine Office," Poplar, Liverpool, or wherever it may be.

S. T. D.—A tumbler sounds its shrillest note when empty. The more water you put in, the basser the note becomes.

THE NAVY.—Buy a quarterly Navy List, and consult the recent circulars. You must procure a field officer's nomination.

HERON.—Order your volume through a local bookseller, and it will cost you nothing for carriage.

HATCHLEY.—For ordinary float-fishing there is no more recent book than the Trent Otter's two-shilling manual, published by Sampson Low and Co.

W. M. P.—The distances between England and Australia, by both routes, and between all the principal ports in the world, are given under the heading of Ocean Highways in the "Standard Commercial Handbook," price five shillings, published by Messrs. Warne and Co.

CONSTANT CHUM.—Waterproof your tent by coating it once or twice with boiled oil.

AN ARTICLED CLERK.—You can get a "Guide to the Intermediate" from any of the booksellers in Chancery Lane.

MUTTON.—New Zealand mutton can be obtained from Fitter and Co. and several other firms in Leadenhall Market. It is not frozen in ice, but is brought over in a cold-air chamber.

S. B. M.—No dumbbell should exceed two pounds in weight. The heavy bells are a great mistake.

MODEL YACHTING.—1. The stem is put on to strengthen the boat, but the curve of the bow should be unbroken, and the catwater should be as sharp as you can make it. Both stem and stern should rake. 2. By "carrying a lee helm" is meant that the boat requires her rudder to keep her up to the wind. 3. Fasten the mainsail after reefing by passing the clew through a cringle on the line of the reef points, and threading it through a hole in the boom on to the cleat. 4. Weighted rudders are always better than weighted tillers, and your headsail should be reduced rather than employ them.

W. H. G. (Southend.)—Your spider appears to be one of the hunting species, but we cannot say for certain. It was dead and shrivelled up when it reached us, and no wonder; whoever heard of feeding a spider on bread-crumbs?

OWEN KING.—Your egg was considerably damaged in its transit through the post, but we have nevertheless identified it as that of the Whitethroat. Pack a little more carefully next time. We cannot return eggs, etc., sent to us for names, whether accompanied by stamps or not.

F. WOODLIFF.—There is a book containing "Articles on Swimming," and its title is "Boy's Own Annual," Vol. 1, price six shillings, published at 56, Paternoster Row.

FRED.—Dumbbells are for light exercises, Indian clubs for heavy exercises. Dumbbells should never exceed four pounds the pair; Indian clubs should be chosen according to the table of weights on page 690, Vol. IV.; but you will do well to follow the advice there given as to not having them too heavy.

SARGENT.—The story of John Maynard, who steered the burning ship from Detroit to Buffalo, first appeared in the "British Workman," and you will find it in the "A 1 Reciter," price sixpence, published by G. Caudwell at 60, Old Bailey.

POUNTRY.—The address of the Willesden Waterproof Paper Company is Willesden Works, Willesden Junction, London, N.W.

B. L.—Thanks; but the fact that "cleanliness is next to godliness" is found in the Mishna (Talmud, treatise Sotul, chap. ix.) does not affect our statement that it was not in the Bible and had been ascribed to Matthew Henry.

WELL-WEISHER (?).—You cannot enter the army without passing an examination, in spelling too. You cannot purchase a commission, for none are now sold; and you cannot be an ensign, for the rank has been abolished.

No. 328.—Vol. VII.

SATURDAY, APRIL 25, 1885.

Price One Penny.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

"Coolly dropping the broom and facing his enemy."

CHAPTER IV.—THE "ROCKET" NEWSPAPER COMPANY, LIMITED.

THE reader may imagine that the walk our two heroes took Citywards that Monday morning was not a very cheerful one. It seemed like walking out of one life into another. Behind, like a dream, were the joyous, merry days spent at Garden Vale and Wilderham, with no care for the future and no want for the present. Before them, still more like a dream, lay the prospect of their new work, with all its anxiety and drudgery and weariness, and the miserable eighteen shillings a week it promised them; and, equally wretched at the present moment, there was the vision of their desolate mother, alone in the Dull Street lodgings, where they had just left her, unable at the last to hide the misery with which she saw her two boys start out into the pitiless world.

The boys walked for some time in silence; then Horace said,

"Old man, I hope, whatever they do, they'll let us be together at this place."

"We needn't expect any such luck," said Reginald. "It wouldn't be half so bad if they would."

"You know," said Horace, "I can't help hoping they'll take us as clerks at least. They must know we're educated, and more fit for that sort of work than—"

"Than doing common labourer's work," said Reg. "Rather! If they'd put us to some of the literary work, you know, Horace—editing, or correcting, or reporting, or that sort of thing, I could stand that. There are plenty of swells who began like that. I'm pretty well up in classics, you know, and—well, they might be rather glad to have some one who was."

Horace sighed.

"Richmond spoke as if we were to be taken on as ordinary workmen."

"Oh, Richmond's an ass," said Reg, full of his new idea; "he knows nothing about it. I tell you, Horace, they wouldn't be such idiots as to waste our education when they could make use of it. Richmond only knows the manager, but the editor is the chief man after all."

By this time they had reached Fleet Street, and their attention was absorbed in finding the by-street in which was situated the scene of their coming labours. They found it at last, and with beating hearts saw before them a building surmounted by a board, bearing in characters of gold the legend, "Rocket Newspaper Company, Limited."

The boys stood a moment outside, and the courage which had been slowly rising during the walk evaporated in an instant. Ugly and grimy as the building was, it seemed to them like some fairy castle before which they shrank into insignificance. A board inscribed, "Work-people's Entrance," with a hand on it pointing to a narrow side court, confronted them, and mechanically they turned that way. Reginald did for a moment hesitate as he passed the editor's door, but it was no use. The two boys turned slowly into the court, where, amid the din of machinery, and a stifling smell of ink and rollers, they found the narrow passage which conducted them to their destination.

A man at a desk half way down the passage intercepted their progress.

"Now, then, young fellows, what is it?"

"We want to see the manager, please," said Horace.

"No use to-day, my lad. No boys wanted; we're full up."

"We want to see the manager," said Reginald, offended at the man's tone, and not disposed to humour it.

"Tell you we want no boys; can't you see the notice up outside?"

"Look here!" said Reginald, firing up, and heedless of his brother's deprecating look; "we don't want any of your cheek. Tell the manager we're here, will you, and look sharp!"

The timekeeper stared at the boy in amazement for a moment, and then broke out with,

"Take your hook, do you hear, you—or I'll warn you."

"It's a mistake," put in Horace, hurriedly. "Mr. Richmond said we were to come here to see the manager at nine o'clock."

"And couldn't you have said so at first?" growled the man, with his hand still on his ruler and glaring at Reginald, "without giving yourselves airs as if you were gentry? Go on in, and don't stand gaping there."

"For goodness' sake, Reg," whispered Horace, as they knocked at the manager's door, "don't flare up like that, you'll spoil all our chance."

Reg said nothing, but he breathed hard and his face was angry still.

"Come in!" cried a sharp voice, in answer to their knock.

They obeyed, and found a man standing with a pen in his mouth at a desk, searching through a file of papers. He went on with his work till he had found what he wanted, apparently quite unconscious of the boys' presence. Then he rang a bell for an overseer, whistled down a tube for a clerk, and shouted out of the door for a messenger, and gave orders to each. Then he sent for someone else and gave him a scolding that made the unlucky recipient's hair stand on end; then he received a visit from a friend, with whom he chatted and joked for a pleasant quarter of an hour; then he took up the morning paper and skimmed through it, whistling to himself as he did so; then he rang another bell and told the errand-boy who answered it to bring him in at one o'clock sharp a large boiled beef underdone, with carrots and turnips, and a pint of "s. and b." (whatever that might mean). Then he suddenly became aware of the fact that he had visitors, and turned inquiringly to the two boys.

"Mr. Richmond—" began Horace, in answer to his look.

But the manager cut him short.

"Oh, ah! yes," he said. "Nuisance! Go to the composing room and ask for Mr. Durfy."

Saying which, he sat down again at his desk, and became absorbed in his papers.

It was hardly a flattering reception, and gave our heroes very little chance of showing off their classical proficiency. They had at least expected, as Mr. Richmond's nominees, rather more than a half glance from the manager; and to be thus summarily turned over to a Mr. Durfy before they had as much as opened their mouths, was decidedly unpromising.

Reginald did make one feeble effort to prolong the interview and to impress the manager at the same time.

"Excuse me," said he, in his politest tones, "would you mind directing us to

the composing room? My brother and I don't know the geography of the place yet."

"Eh? Composing room? Get a boy to show you. Plenty outside."

It was no go, evidently; and they turned dismally from the room.

The errand-boy was coming up the passage as they emerged—the same errand-boy they had seen half an hour ago in the manager's room; but, as their classical friends would say—

"Quantum mutatus ab illo Hecfore!"

His two arms were strung with the handles of frothing tin cans from the elbow to the wrist. He carried two tin cans in his mouth. His apron was loaded to bursting with bread, fish, cheese, potatoes, and other edibles; the necks of bottles protruded from all his pockets—from the bosom of his jacket and from the fob of his breeches, and round his neck hung a ponderous chain of onions. In short, the errand-boy was busy; and our heroes, even with their short experience of business life, saw that there was little hope of extracting information from him under present circumstances.

So they let him pass and waited for another. They had not to wait long, for the passage appeared to be a regular highway for the junior members of the staff of the "Rocket Newspaper Company, Limited." But though several boys came, it was some time before one appeared whose convenience it suited to conduct our heroes to the presence of Mr. Durfy. Just, however, as their patience was getting exhausted, and Reginald was making up his mind to shake the dust of the place from his feet, a boy appeared and offered to escort them to the composing room.

They followed him up several flights of a rickety staircase, and down some labyrinthine passages to a large room where some forty or fifty men were busy setting up type. At the far end of this room, at a small table, crowded with "proofs," sat a red-faced individual whom the boy pointed out as "Duffy."

"Well, now, what do you want?" asked he, as the brothers approached.

"The manager said we were to ask for Mr. Durfy," said Reginald.

"I wish to goodness he'd keep you down there; he knows I'm crowded out with boys. He always serves me that way, and I'll tell him so one of these days."

This last speech, though apparently addressed to the boys, was really a soliloquy on Mr. Durfy's part; but for all that it failed to enchant his audience. They had not, in their most sanguine moments, expected much, but this was even rather less than they had counted on.

Mr. Durfy mused for some time, then turning to Reginald he said,

"Do you know your letters?"

Here was a question to put to the captain of the fifth at Wilderham!

"I believe I do," said Reginald, with a touch of scorn in his voice which was quite lost on the practical Mr. Durfy.

"What do you mean by believe? Do you or do you not?"

"Of course I do."

"Then why couldn't you say so at once. Take this bit of copy and set it up at that case there. And you, young fellow, take these proofs to the sub-editor's room, and say I've not had the last sheet of the copy of the railway acci-

dent yet, and I'm standing for it. Cut away."

Horace went off.

"After all," thought he to himself, "what's the use of being particular. I suppose I'm what they call a 'printer's devil'; nothing like starting modestly! Here goes for my lords the sub-editors, and the last page of the railway accident."

And he spent a festive ten minutes hunting out the sub-editor's domains, and possessing himself of the missing copy.

With Reginald, however, it fared otherwise. A fellow may be head of the fifth at a public school and yet not know his letters in a printing office, and after five or ten minutes' hopeless endeavours to comprehend the geography of a type-case he was obliged to acknowledge himself beaten and apprise Mr. Durfy of the fact.

"I'm sorry I misunderstood you," said he, putting the copy down on the table. "I'm not used to printing."

"No," said Mr. Durfy, scornfully, "I guessed not. You're too stuck-up for us, I can tell you. Here, Barber."

An unhealthy-looking young man answered to the name.

"Take this chap here to the back case-room, and see he sweeps it out and dusts the cases. See if that'll suit your abilities, my dandy," and without waiting to hear Reginald's explanations or remonstrances Mr. Durfy walked off, leaving the unlucky boy in the hands of Mr. Barber.

"Now, then, stir your stumps, Mr. Dandy," said the latter. "It'll take you all your time to get that shop straight, I can tell you, so you'd better pull up your boot. Got a broom?"

"No," muttered Reg, through his teeth, "I've not got a broom."

"Go and get that one, then, out of the corner there."

Reginald flushed crimson, and hesitated a moment.

"Do you 'ear? Are you deaf? Get that one there."

Reginald got it, and trailing it behind him dismally, followed his guide to the back case-room. It was a small room, which apparently had known neither broom nor water for years. The floor was thick with dirt, and the cases ranged in the racks against the walls were coated with dust.

"There you are," said Mr. Barber. "Open the window, do you 'ear? and don't let none of the dust get out into the composing room, or there'll be a row. Come and tell me when you've done the floor, and I'll show you 'ow to do them cases. Rattle along, do you 'ear? or you won't get it done to-day," and Mr. Barber, who had had his day of sweeping out the shops, departed, slamming the door behind him.

Things had come to a crisis with Reginald Cruden early in his business career.

He had come into the City that morning prepared to face a good deal. He had not counted on much sympathy or consideration from his new employers; he had even vaguely made up his mind he would have to rough it at first; but to be shut up in a dirty room with a broom in his hand by a cad who could not even talk grammar was a humiliation on which he had never once calculated.

Tossing the broom unceremoniously into a corner, he opened the door and walked out of the room. Barber was

already out of sight, chuckling inwardly over the delicious task he had been privileged to set to his dandy subordinate, and none of the men working near knew or cared what this pale, handsome new boy did either in or out of the back case-room.

Reginald walked through them to the passage outside, not much caring where he went or whom he met. If he were to meet Mr. Barber, or Mr. Durfy, or the manager himself, so much the better. As it happened he met Horace, looking comparatively cheerful, with some papers in his hand.

"Hullo, Reg," said he; "have they promoted you to a 'printer's devil' too? Fancy what Bland would say if he saw us! Never mind, there's four hours gone, and in about another six we shall be home with mother again."

"I shall be home before then," said Reg. "I'm going now. I can't stand it, Horace."

Horace stared at his brother in consternation.

"Oh, Reg, old man, you mustn't; really you mustn't. Do let's stick together, however miserable it is. It's sure to seem worse at first."

"It's all very well for you, Horace, doing messenger work. You haven't been set to sweep out a room."

Horace whistled.

"Whew! that is a drop too much! But," he added, taking his brother's arm, "don't cut it yet, old man, for mother's sake, don't. I'll come and help you do it if I can. Why couldn't they have given it me to do, and let you go the messages!"

Reginald said nothing, but let his brother lead him back slowly to the big room presided over by Mr. Durfy.

"Where is it?" he inquired of Horace at the door.

"That little room in the corner."

"All right. I'll come if I possibly can. Do try it, old man, won't you?"

"I'll try it," said Reginald, with something very like a groan as he opened the door and walked grimly back to the back case-room.

Horace, full of fear and trembling on his brother's account, hurried with his copy to Mr. Durfy, and waited impatiently till that grandee condescended to relieve him of it.

"Is there anything else?" he inquired, as he gave it up.

"Anything else? Yes, plenty; but don't come bothering me now."

Horace waited for no more elaborate statement of Mr. Durfy's wishes, but thankfully withdrew and made straight for Reginald.

He found him half hidden, half choked by the dust of his own raising, as he drew his broom in a spiritless way across the black dry floor.

He paused in his occupation as Horace entered, and for a moment, as the two stood face to face coughing and sneezing, a sense of the ludicrous overcame them, and they finished up their duet with a laugh.

"I say," said Horace, as soon as he could get words, "I fancy a little water would be an improvement here."

"Where are we to get it from?" said Reg.

"I suppose there must be some about. Shall I go and see?"

"We might tip one of those fellows outside a sixpence to go and get us some."

"Hold hard, old man!" said Horace, laughing again. "We're not so flush of sixpences as all that. I guess if we want any water we shall have to get it ourselves. I'll be back directly."

Poor Reg, spirited up for a while by his brother's courage, proceeded more gingerly with his sweeping, much amazed in the midst of his misery to discover how many walks in life there are beyond the capacity even of the captain of the fifth of a public school.

He was not, however, destined on the present occasion to perfect himself in the one that was then engaging his attention. Horace had scarcely disappeared in quest of water when the door opened, and no less a personage than the manager himself entered the room.

He was evidently prepared neither for the dust nor for the duster, and started back for a moment as though he were under the impression that the clouds filling the apartment were clouds of smoke, and Reginald was another Guy Fawkes caught in the act. He recovered himself shortly, however, and demanded, sharply, "What are you doing here, making all this mess?"

"I'm trying to carry out Mr. Durfy's instructions," replied Reginald, leaning on his broom, and not at all displeased at the interruption.

"Durfy's instructions? What do you mean, sir?"

"Mr. Durfy—"

"That will do. Here, you," said the manager, opening the door, and speaking to the nearest workman, "tell Mr. Durfy to step here."

Mr. Durfy appeared in a very brief space.

"Durfy," said the manager, wrathfully, "what do you mean by having this room in such a filthy mess? Aren't your instructions to have it swept out once a week? When was it swept last?"

"Some little time ago. We've been so busy in our department, sir, that—"

"Yes, I know; you always say that. I'm sick of hearing it. Don't let me find this sort of thing again. Send some one at once to sweep it out, this lad doesn't know how to hold a broom. Take care it's done by four o'clock, and ready for use. Phew! it's enough to choke one."

And the manager went off in a rage, coughing.

Satisfactory as this was, in a certain sense, for Reginald, it was not a flattering way of ending his difficulties, nor did the spirit in which Mr. Durfy accepted his chief's reprimand at all tend to restore him to cheerfulness.

"Bah, you miserable idiot, you! Give up that broom and get out of this or I'll chuck you out."

"I don't think you will," said Reginald, coolly dropping the broom and facing his enemy.

He was happier at that moment than he had been for a long time. He could imagine himself back at Wilderham, with the school bully shouting at him, and his spirits rose within him accordingly.

"What do you say? you hugger-mugger puppy, you—"

Mr. Durfy's adjectives frequently had the merit of being more forcible than appropriate, and on the present occasion, what with the dust and his own rage, the one he wanted stuck in his throat altogether.

"I said I don't think you will," repeated Reginald.

Mr. Durfy looked at his man and hesitated. Reginald stood five foot nine, and his shoulders were square and broad. Besides, he was as cool as a cucumber, and didn't even trouble to take his hands out of his pockets. All this Mr. Durfy took in and did not relish; but he must not cave in too precipitately, so he replied, with a sneer,

"Think! A lot you know about thinking! Can't even hold a broom. Clear out of here, I tell you, double quick; do you hear?"

Reginald's spirits fell. It was clear from Mr. Durfy's tone he was not going to attempt to "chuck him out," and

nothing therefore could be gained by remaining.

He turned scornfully on his heel, knowing that he had made one enemy at any rate during his short connection with his new business.

And if he had known all he could have counted two; for Mr. Durfy, finding himself in a mood to wreak his wrath on some one, summoned the ill-favoured Barber to sweep out the back case-room, and gave his orders so viciously that Barber felt distinctly aggrieved, and jumping to the conclusion that Reginald had somehow contrived to turn the tables on him, he registered a secret vow there

and then that he would on the first opportunity and on all subsequent opportunities be square with that luckless youth.

Caring very little about who hated him or who liked him, Reginald wandered forth, to intercept the faithful Horace with the now unnecessary water, and the two boys, finding very little to occupy them during the rest of the day, remained in comparative seclusion until the seven o'clock bell rang, when they walked home, possibly wiser, and certainly sadder, for their first day with the Rocket Newspaper Company, Limited.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XVII.—A CONSULTATION AND ITS RESULTS.

MR. BRANDT, the German lawyer to whose keeping the valuable papers discovered by Tenterton had been confided, lived in the Tollylolskie Peryoulok, in the immediate neighbourhood of the English church. Everybody knows the former. It is a short street almost at right angles with the Katmewskie, and therefore parallel with the Doggiebowwouskie Boulevard. The houses, though perfectly respectable, are not like those of the wealthier classes to which the reader has been accustomed. They are chiefly large houses built in flats, and so constructed that each storey should contain accommodations for two families. Every lodging is therefore a self-contained "house" in the sense of house meaning home.

The lawyer is hard at work. There is a heavy case in which he is concerned, and on which his whole mind is now being concentrated. He is working at home, and not at the office, which is situated nearer to the courts of law.

"Good morning, Mr. Tenterton. You don't work like this in England. I have not been to bed yet, so you will excuse my dressing-gown, slippers, and general seediness. What can I do for you?"

Tenterton smiled as he answered, "I have come from Mr. Smirnoff to ask you to meet him, Count Schaafstadt, the police-master, and myself, at his house in the Loubiyanka to-morrow."

"I shall be only too happy if the time they decide on will suit, but I must be in court until four o'clock, so there is not much chance of an interview before evening."

"I am very anxious about this consultation," said Tenterton; "so much—nay, everything—depends upon it. Those papers which you have are such complete evidence of the worst possible conduct on the part of Abrazoff, and yet the rest seem to desire to shield him from the consequences of his conduct in the suppression of Ivan's identity. To me it seems unpardonable. And yet at Pretchiestova it did not seem so very terrible, somehow, from hearing the Russians speak of it with comparative indifference."

"You feel the effects of contrary in-

fluences very keenly, most likely on account of your youth, for you are really very young to have so much upon your hands. I am all the more rejoiced that the papers are safe in my keeping. Now I must ask you a very important question. Has the boy, upon whom so much depends, turned up yet?"

"No, nobody has any idea of what has become of him. Mr. Smirnoff is quite beside himself, and although no reward is publicly offered, it would be a good day's work for any one who should find him and bring him home. It will be a week to-morrow since he has been missing for the second time."

"Very well, I shall not fail to be present, and what advice I can give on the law of the matter shall be at your service. You have quite recovered from the effects of your accidents and adventures by flood and field?"

"Thanks! I am all right now. There was no particular damage done to me on the railway; I came off worse at the fire."

"Have you any theory about those papers beyond what we have arrived at as to their accidental position in the drawer?"

"What other theory could I form?"

"Oh, I don't know. I am not going to prompt you. Of course I know nothing of the business beyond the instructions received from you. But you must *think* a great deal about the matter. It is a serious event in so young a life to set such machinery in motion, for such ends too, among such important people in a foreign country. Upon my word you begin your Russian career uncommonly well."

"What did you mean about the extra theory I was to form? That question puzzles me still. Of course I *think* about it, as you say, but there is nothing new in the matter to be evolved by my thinking or theorising."

"Did you ever *think* what might have caused the fire?"

Tenterton started.

"Who, I? No. How should I?"

"It never occurred to you, did it, that the house might have been set light to just to destroy those papers? You see, in a family like that—"

"I saw nothing against the family. I disliked Mr. Abrazoff's manners, which were coarse and occasionally brutal, but I never gave him credit for such a crime as arson."

"Would it have been much worse than the trick of keeping this boy out of his own, suppressing him, socially murdering him, and enjoying his possessions? I don't see much difference. It may be a step deeper in a bad course, but I can't see, for the life me, that it is so much worse a crime from a criminal point of view."

"I am horrified at the idea," said Tenterton, who had been gazing at Mr. Brandt in mute astonishment. "I never suspected such a thing, nor do I suspect it now. Such a suspicion will never be referred to seriously, I hope. Should it arise I should feel bound to combat it."

"Very good," replied Mr. Brandt; "we will keep our suspicions to ourselves for the present, but I fear they will not be kept down so completely as you wish."

The next day was the scene of the conference in the Loubiyanka, which was arranged to take place at eight o'clock in the evening. The first arrival was Count Schaafstadt, who was at once shown up into the grand new suite of salons recently prepared for Smirnoff, who received the great man most respectfully, but still with an amount of sadness which was greatly at variance with his usual jovial demeanour and unconstrained manner. He led his distinguished guest to a seat on a gilt sofa covered with white satin, which was the colour and material of the hangings and upholstery. The count was most engaging in his manner, and the charm of his conversation soon made itself felt.

"No," he said; "there is nothing in the whole world so holy as paternal love. And when a man has been denied offspring of his own there is generally some channel found into which this love can flow. In your own case you may be sure that this object of your fondest care, this curious boy Ivan Dobroff, will turn out the fitting medium for the development of this highest of all human feelings in your own heart. Depend upon it that this second absence is only a trial of your

"It was torn into fragments."

heart, and you will love your adopted son all the more for your present separation."

Smirnov could not reply. He pressed in silence the hand of the count, who was about to speak when a servant announced his High Excellency Ivan Petrovitch Kakarov. Smirnov rose, and the count gave the new comer one of his most engaging smiles.

Shortly after Tenterton arrived with Mr. Brandt, who was provided with a portfolio closed with a formidable lock. The two last comers were warmly welcomed by the assembled guests, and after the usual Russian formal but very courteous way of arranging preliminaries, Brandt stated the case in due form, greatly to the surprise and indignation of Smirnov. The other parties were, as we know, fully acquainted with the story in its general aspects, but the legal skill of Brandt gathered the whole evidence into a narrow circle, and put them all in possession of the facts in a new and striking way.

"I do not see," he added, "after having the facts put before us in so palpable a way, and after the proofs have been examined, I do not see how we are justified in dealing with this matter privately. To me it seems that, whatever the rank and standing of the parties may be, the whole thing ought to come before a court of justice."

As he said these words, a servant approached and announced Abrazoff.

It was a serious moment for the guests, and Tenterton felt particularly awkward at having been the means of bringing all this about. No person seemed at his ease. Certainly Abrazoff did not as he bowed ungracefully to the assembly.

"Good evening," said the count, bowing to the new comer. "We have asked you to be present this evening at a small family council in which it would appear you are an interested party."

"You do me too much honour to include me in a party in which you yourself take a prominent position."

"Pray take a seat," said Smirnov, wheeling an enormous gilt chair, covered with white satin, towards the new comer, but on the farther side from the sofa on which, as the seat of honour, the count and Kakarov sat. At the two ends of the table were Smirnov and Tenterton respectively, and opposite the count and the prefect of police (in full uniform) sat Brandt and Abrazoff.

The proceedings were opened by Kakarov, who addressed Abrazoff in these words:

"Nicolai Alexandrovitch Abrazoff, at the instance of his Serene Highness the Count Schaafstadt we have invited you to meet us here to discuss a question greatly affecting the honour of the order, and to suggest a certain mode of action to yourself, as the party most concerned."

"I concerned!" exclaimed Abrazoff, turning pale with excitement. "I can hardly conceive how I can have the honour to be concerned in a matter which touches the interest of such a distinguished person as Count Schaafstadt."

"Will you kindly allow us to present the whole case to your mind as it really

exists, and divested of all legal subtleties? We wish to have your opinion as to how we ought to act, and, to put it plainly, to give you the choice of two alternatives—either to allow the matter under discussion to be settled amicably amongst us now, or to have the whole story brought before a judge in full court."

"Your Excellency has the advantage of me in knowing all about the subject on which this interesting cabinet council has been called. I must remind you that I am perfectly ignorant of the question."

Kakarov resumed, without any change of demeanour, "That is just, but I must premise before opening the matter to you that I am going out of the way of the strict course both of law and of justice in allowing you to have the choice which we think it advisable to give to one of the order, whereas in the case of a common offender arrest and investigation by the police would be preliminaries to a trial in the criminal court at the Kremlin."

(To be continued.)

THE GOLD FISH.

BY REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER III.

MISS DAVIS had resolved not to question her nephew immediately about the lost fish. She knew enough of his character to believe that, if he had committed an act of disobedience, his guilty conscience would drive him to unburden himself before long of the heavy secret; so, when Edwin made his appearance in the breakfast-room next morning with an anxious heart, he found his anxiety groundless. His aunt never alluded to the cause of his apprehension. Her only question in any way connected with it was, "Edwin, where were you last evening when I came to your room?" To which question the answer was returned, "Please, aunt, I would rather not say."

Breakfast was soon over. Edwin got his books and went off to Highfield House. Miss Davis, having attended to her domestic duties, settled herself at her davenport. A look of stern resolution was stamped upon her face. She had thought deeply upon Edwin's last words at tea the evening before. They had harassed her dreams and made hideous her waking thoughts. And the result of her cerebration was the grim conviction that Mr. Fields was a thoroughly unprincipled man, intentionally undermining the morality of the Highfield boys by countenancing—nay more—encouraging dishonesty in the use of "cribs."

Now Miss Davis had a dreadful horror of the word "crib," and "quite right too" you will surely say. It is to be hoped that every boy who reads the *BOY'S OWN PAPER* has the same dreadful horror of the word "crib." If you ever degrade yourself so miserably as to cheat in lessons, please stop reading this story. I am not writing for you. I should not like to have anything more to do with you until you first learn the inamy of such a practice. Cheats, swindlers, and forgers are of one class.

Miss Davis very properly detested the word "crib." She had good cause so to do. For her favourite brother, I regret to say, once got into desperate trouble at school through using cribs. Detected and denounced, he ran away in terror of the consequences, and brought indelible disgrace upon himself and his family.

The maiden aunt, therefore, sat down, determined at once to bring the imaginary culprit to justice. She mended her pen and wrote the following letter to Dr. Porchester:

"Dear Sir,—I feel it my painful duty to inform you that I have strong reasons to believe that Mr. Fields is encouraging dishonesty in work among the boys entrusted to your care. I have no doubt you will know how to deal with the matter discreetly. Regretting the necessity of this information, I remain, yours truly,

"M. DAVIS."

This letter, dispatched by special messenger, was delivered to Dr. Porchester in the schoolroom while he was enjoying what he called a "field-day" of spelling and dictation with the junior classes. He had just delivered the following sentence to be written down: "The soldiers

were a prey to the miseries of gnawing hunger." And he was standing on the form looking over the curly head of an audacious youngster who had spelt the word "gnawing" thus—"kngnaghning." This is no invention, mind, but a positive fact, and so interesting in its ingenuity that it deserves to be recorded.

The Doctor was always prepared for eccentricities of orthography, and kept a book in which any worthy of special notice were entered. This specimen was like a magnum-bonum plum, and was duly recorded with his best embellishments of penmanship.

At such a juncture was Miss Davis's note received by the head master of Highfield House. He read it forthwith, in case it might require an immediate answer. His amazement was only equalled by his amusement. He found the accused in the quarter-hour, and, taking him familiarly by the arm, marched him off to the cricket-field, where he thus disclosed the extraordinary information:

"Look here, Fields. I have received a letter from Aston's aunt, bringing a serious charge against you. Just read it!"

Mr. Fields read it; and as he read, his eyes opened wider, his eyebrows were elevated, the corners of his mouth quivered with twinkling undulations. He looked up at Dr. Porchester and burst into a fit of uncontrollable laughter.

"Well," said the Doctor, likewise laughing; "what have you to say in your defence? What explanation can you give?"

"None, Doctor! The lady is not sufficiently explicit. What in the world has she got hold of?"

"I can't tell. The best way will be to call upon her this afternoon and ask. Shall you be agreeable to a walk that way?"

"Certainly, Doctor, thank you. I shall be delighted."

Accordingly, as soon as dinner was over, Dr. Porchester and Mr. Fields proceeded on their visit to Chesterton House, and rang at the house-door bell about 2.30.

Miss Davis had not calculated upon this move in the problem. For once her sagacity was at fault. She was eminently of a nervous temperament. She fondled herself upon the notion of her extreme sensitiveness. In many a skirmish with her nephew she would clench the matter, and prevent all further parley, by a prominent display of pocket-handkerchief, and a whimpering, pathetic appeal that he would "consider her weak nerves." This was unanswerable. Edwin had always to capitulate unconditionally.

Miss Davis was reposing after the fatigue of lunch when the bell rang. The sound startled her. She jumped up, flew to the window, peeped through a slide of the Venetian blind. The prospect of visitors was always agitating. Two gentlemen! Horrible! How in-

considerate of them! Who could they be? What could they want? Being short-sighted, and not having her spectacles at hand, she could not recognise them.

The man-servant soon afterwards knocked at the door of her room, and announced that Dr. Porchester and Mr. Fields were waiting below.

Miss Davis, flurried and excited, declared that she positively could not see them.

"It's quite out of the question, James. My nerves are so upset this afternoon. I must decline to see any one. Present my compliments to the gentlemen, and make my excuse with suitable apologies."

James retired, but shortly returned with a very polite expostulation. Dr. Porchester was extremely sorry to be importunate, but would esteem it a great favour if Miss Davis would kindly grant him a few moments' interview.

"Oh, well, I suppose I must consent, James. Come in, and find my salts-bottle. It's somewhere about the room, or else in the library, or possibly in the drawing-room. And tell Jane to fetch me another handkerchief, and let the coachman know that I shall take a drive at four o'clock. And then show Dr. Porchester upstairs. Request Mr. Fields to remain below. Oh, my poor nerves!"

James retired, to execute as much or as little of his mistress's injunctions as he deemed the occasion to demand. He was accustomed to her vagaries, and knew how to treat them.

A brief interval, and Dr. Porchester was ushered into the lady's presence.

"Good afternoon, Miss Davis. I am sorry to hear you are somewhat indisposed. The hot weather is very trying. I thought it best to—"

"Thank you, Dr. Porchester; it's very kind of you to call. Don't come any nearer; please take a seat. I'm in rather a nervous state. I'm not so strong as I used to be—I have had some painful anxiety about my nephew—since yesterday" (Dr. Porchester fondly hoped she was coming to the point at once). "I have reason to fear he has been guilty of an act of disobedience—I should like to confide in you—may I?—You take such kind interest in the boy—I think he is well-disposed and honest as a rule—but I fear he yielded to temptation yesterday."

Miss Davis had a way of delivering her sentences with a peculiar punctuation, inserting between each a little tremulous gasp, apparently on the point of pausing for a reply, but always continuing the conversation just as her listener was about to take it up. It is no easy task to converse with such a person. It is a matter requiring tact and delicacy and self-control, and imperturbable patience. In all these elements of social politeness, Dr. Porchester flattered himself that he excelled. But he was sorely tried on this occasion, and before the interview closed he half-doubted his title to rank as a man of unquestionable patience and self-restraint.

Miss Davis was compelled through physical exhaustion to pause for breath. Now was the Doctor's chance. He saw that she was launching forth upon a dangerous digression. His time was precious. School at four. He grudged each moment not spent under the blue firmament of heaven. He therefore seized the opportunity to hint in the broadest manner that he had called specially to ask on what grounds Miss Davis had reason to suspect Mr. Fields of dishonest inclinations.

"Oh yes, to be sure, Dr. Porchester. It was very kind of you to call—Mr. Fields is undoubtedly a very pleasant young man with boys—my nephew always speaks of him with regard; I may say admiration. He's a very dear man."

"But, may I ask?"—the doctor forced himself to the front—"what reasons you have, Miss Davis, for throwing such grave suspicions upon his character?"

Surely Miss Davis must be brought to bay by such a point-blank question. "Varium et mutabile semper femina," says the poet; and the Doctor found this specimen as difficult to lay hold of as Harry Dawson found the tail of the gold fish.

"Oh, Dr. Porchester, I was conversing with Edwin at the tea-table. He is a very thoughtful child—and I hope you find him diligent and attentive in his studies—he was talking to me upon historical and classical subjects—really, for so young a boy, his conversation is considerably beyond his years—yes—beyond his years—I anticipate for him a brilliant future."

Again the worthy Doctor leapt in at the breach.

"I sincerely hope so, Miss Davis. But I have very little time to spare this afternoon" (taking out his watch ostentatiously), "and if you would kindly tell me what grounds—"

"Oh, certainly, Dr. Porchester—certainly—Yesterday afternoon I had occasion to take a drive—Before starting I called my nephew, and said to him distinctly—without any irritability of voice or gesture—Edwin—"

As has been previously intimated, Dr. Porchester was a man of polished and courteous manners at all times. His respect for the female sex was absolutely unimpeachable. Was it his fault that at this particular moment he should be seized with a spasm of bronchial catarrh, under the influence of which he gave vent to a somewhat violent guttural noise, the immediate effect of which was to startle Miss Davis into an abrupt pause in the course of her speech, and to elicit from her the exclamation,

"Oh, my poor nerves!"

Now it was indeed sad that a man so well trained in bearing with the idiosyncrasies of parents and guardians of the young lambs committed to his care—that a man who prided himself upon never being taken off his guard—should ever be betrayed into any unceremonious conduct. True that his time was precious, that his soul was vexed with indignation at the consciousness of being thwarted in his purpose. But should he have risen from his seat so hastily? Should he have taken two steps towards the lady with hat in hand and walking-stick unnecessarily brought to the front? No, he certainly should not. But man is only mortal after all, and a schoolmaster

is so accustomed to receive instant obedience to his wishes that we must make some allowance for the worthy man's behaviour.

"Really, Miss Davis," said he, with some warmth, "I have hardly five minutes to spare. I must beg you to postpone other matters for another occasion, and let me know the plain truth about your accusation against—"

"Oh, don't come nearer me, please. My nerves are very sensitive, Dr. Porchester—I assure you I hardly know sometimes how I shall get through the day. Edwin is a very dear—"

"I must apologise for interrupting you, Miss Davis, but as you are unable to inform me upon the extraordinary information conveyed in your letter of this morning, I see no need to intrude further upon your time, and—"

"Not at all, I assure you, Dr. Porchester. You are so sympathetic and considerate—"

"Well, good afternoon, Miss Davis. I hope you will soon recover your sen—I mean, I hope to-morrow you will be not quite such—that is—hm—hm. Good-bye, Miss Davis!"

"Good-bye, Dr. Porchester—it was so kind of you to call—it does me so much good to talk to you about my dear nephew—I hope he will always—"

But Dr. Porchester was half way down the stairs, and only heard the distant echoes of the last remark.

(To be continued.)

OUR NOTE BOOK.

THE COLLEGES AND CHRISTIAN MISSIONS.

Our readers already know of what our leading public schools are doing in the way of sustaining home mission work in the poorer and

more ignorant districts of the metropolis, particularly in the East End. Now we have another cheering event to chronicle.

On February 4th a meeting was held in Exeter Hall, London, of more than usual interest. It was arranged for by the Young Men's Christian Association to give the little company of young men—consisting of a curate, a late captain of the Cambridge eleven, a late stroke of the Cambridge eight, three other Cambridge graduates, and two officers from the army, one from the 2nd Dragoons, the other from the Royal Artillery—the opportunity of addressing once more their fellow young men on the subject of Missions, before themselves proceeding to China to devote their lives to Christ, as well as of declaring to them the grand old Gospel. Some forty undergraduates from Cambridge were present at the meeting, having come up for the occasion, and the great hall was nearly filled with young men. The names of those thus going out to battle with ignorance, idolatry, and heathendom were as follows:—Rev. W. W. Cassels, B.A., St. John's College, Cambridge; Mr. Stanley P. Smith, B.A., Trinity College, the well-known Cambridge stroke; Mr. C. T. Studd, B.A., Trinity College, the equally well-known Cambridge cricketer; Mr. D. E. Hoste (late of the Royal Artillery); Mr. Montagu Beauchamp, B.A., Trinity College, Cambridge; Mr. Cecil Pollhill-Turner (of the 2nd Dragoon Guards); and Mr. Arthur T. Pollhill-Turner, B.A., Trinity Hall and Ridley Hall, Cambridge.

In the course of his farewell address Mr. Stanley Smith said:

"I would just call your attention to this fact—and it is a fact, and a fact that we ought to take deeply to ourselves—that the knowledge of this precious Jesus, who, I hope to most of us, is everything in the world, is absolutely wanting to thousands and millions of our brethren and sisters in the present day. What are we going to do? What is the use of calling big meetings like this if the outcome is not to be something worthy of the name of Jesus? He wants us to take up our cross and follow Him. To leave fathers and mothers and brethren and sisters and friends and property and everything we love, and carry the Gospel to the perishing ones. We are not to labour, said He, for the meat that perisheth, but for that which endureth to everlasting life."

Then Mr. Studd, in the course of an earnest address, said:

"I want to recommend you to-night to my Master. I have tried many ways of pleasure in my time; I have been running after the best Master, and, thank God, by His grace I have found Him. I wish to tell you how the Lord has sought and found me, and how He has led me back to Himself. It was seven years ago when I was converted—saved—when I knew the Lord Jesus Christ as my Saviour, and felt that He had forgiven me my sins. I knew ever since I was a little child—for I had always been so taught—that Christ was the Saviour of the whole world; but I had never known that He was *my* Saviour until then. When I did know it I was happy, and loved Jesus Christ with all my heart. But instead of going and telling others of the love of Christ, I was selfish and kept the knowledge all to myself. The result was that gradually my love began to grow cold, and as it began to grow cold, the love of the world began to come in. I spent six years in that unhappy backsliding state. God brought me back at the beginning of last year, and I then saw what the world was worth. The Lord restored to me the joy of His salvation. Still further, He set me to work for Him, and I began to try and persuade my friends to read the Gospel, and to speak to them individually about their souls. The Lord was very loving, and He soon gave me the consolation of saving one of my nearest and dearest friends. . . . I wonder what you would say of me if, now that I am going out to China, I bought a large outfit of things absolutely useless out there. You would say I had gone mad. But what are you doing? You are only going to be on this earth for a short time, and there is eternity to come. And which are you really living for? Are you living for the day, or are you living for the life eternal?"

In the midst of all the war and rumours of war that now disturb and distract the nations, it is surely something to cheer all Christian hearts to see a noble band of young men thus voluntarily giving up all worldly distinction, and foregoing all worldly advantage, to devote their lives to the proclamation of the "good tidings" of the Prince of Peace.

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER III.—COLIN'S FIRST SORROW—UNDER ARREST!

"Revenge, at first though sweet,
Bitter ere long on itself recoils."
—Milton.

IT occurred rather suddenly one morning to Colin McLeod that he loved his father and mother, his brother, and his old uncle very much indeed. This was just about a week before he was to start south in order to join his ship. He had already been away to pass his first examination, which, thanks to the tuition of good old Dominie Clayton, he did so successfully as to score within one hundred of the largest number of marks that it was possible to obtain.

When the letter containing the joyful news arrived at Colin's Highland home it was received with varied feelings of emotion by those to whom it was written.

The old running-postman brought the news about luncheon time. McLeod himself tore open the letter in a more nervous manner probably than quite became the dignity and stoicism we generally expect in a Scottish chief.

His wife sat anxiously watching him as he read it. Captain Peter was all of a fidget with impatience. Ronald went quietly on with his luncheon, but he was thinking.

"I knew," said the McLeod, "the lad would never disgrace the name he bears. Bless his heart!"

Ronald was thinking that he might as well have gone to sea or been a soldier and come in for a share of the pay and position inseparable from such professions, and he almost sighed to think there was and could be no chance of it; that he must stay at home and lead the life of a gamekeeper, or something very like it; a Highland chief indeed, but with no more means to support his position than that possessed by a Lowland drover.

Mrs. McLeod read the letter from her dear boy, and handed it to her brother without daring to speak, for the tears were welling up in her mother's heart and almost choking her. If the truth must be told, she would have been almost pleased had Colin failed to pass. Others might have said he was not clever, she would have put it down to nervousness, and been glad to have him back again.

Captain Peter read the letter, then pushed away his plate and pushed back his chair and took a few turns up and down the floor, stamping vigorously with his wooden leg as if to control some emotion of which he was ashamed. Then he shook hands with every one in the room, beginning with his sister and ending with the white-haired serving-man, Raoul Cabrach.

"This is a memorable day," he cried, "for the house of McLeod. That boy will be an admiral before he is a dozen years older. Raoul," he continued, "run as fast as your aged limbs will carry you to Dominie Clayton's; tell him the news, tell him to give the school a holiday, and come over to the castle for a spell."

"To be surely, sir," cried the duinewassel, "she'll do that whate'er, and quik'll be her motions."

Raoul did not wait to put on his bonnet, but went off with a rush, his long white hair streaming behind him in the breeze.

Yes, in one brief week more Colin McLeod was to leave home to commence his cadetship. The week that had gone before had passed all too soon, and so would the coming one; then he would go from home, really from home for the first time in his life, for what appeared long interminable months. He could not help noticing that his mother's eyes were frequently red, that his brother's manner was subdued towards him, and his father's softened from its wonted Spartan austerity; that he was even an object of mournful interest to servants and retainers. And so in his heart of hearts he loved them all for their love for him. He had always been in the habit of looking upon his uncle as—well, just a trifle peculiar. He had often laughed—he felt sorry and ashamed of it now—to see the old man stumping excitedly up and down the floor of the tartan parlour as he talked politics with Colin's father, with that wonderful old wooden leg of his which he would not have exchanged for a modern cork one for all the world.

"Shams, madam! shams! shams!" he exclaimed one day to his sister, as she ventured to suggest the propriety of his investing in one of the new-fashioned flexible not-to-be-detected limbs. "Shams, madam. I'm not ashamed of my timber toe." Here he smacked it lustily with the palm of his hand as it stuck out from the chair in front of him. "I left the real one on the battle-deck of the Bellona, and I'd have parted with the other and clattered around on two wooden ones for the sake of my Queen and my country."

The week passed by. I am not going to mention any of the sorrowful details of the parting. Partings are sad things at the best, and there is a deal about all of them that an author may well leave unsaid.

Of course Colin met the keeper's boy Duncan the day before in the dear old wood, their usual trysting-place, and there was a lump in the throat of each. They sat for a long time talking about the future, and Duncan still stuck to his determination to join the marines as soon as his friend should finally pass, and Colin promised to get his uncle's influence to get him into the same ship after his shore drill was completed.

They said "Farewell" at last, and Colin stopped in the wood to think a bit while Duncan marched off, trying hard to whistle.

Colin threw himself on the ground. "What a dear quiet old place," he thought. "No more gerunds in 'dum' nor gerunds in 'do' now, though. I'll often think of home when far away at sea. I dare say most boys would feel as I do. I hope they would. The only thing is that I mustn't ever be afraid to do my duty. I'll keep a journal from the very first, a log they call it; and I'll write a little bit every night to my

mother and post the letter once a week. Must write to uncle as well. What a shame of me ever to laugh at him. But if—"

"Ahem!"

It was a voice close beside him; he had not heard the footsteps on the soft moss.

Colin looked up. There stood his big quondam foe, whom Billy the goat had so unceremoniously pitched across the stream. He looked half ashamed.

"I knew you were alone-like," he said, "and ran up to say good-bye like. Here is a little book, the 'Scottish Chiefs.' Will you take it, in remembrance like?"

This farmer lad might have been shy, but he was very sincere.

"I'll take it, and gladly," cried Colin, "and I won't forget you, mind that."

"Good-bye."

"Good-bye."

Colin still stayed in the wood, thinking of his future life and prospects.

He was a romantic boy. I like a boy who is so; he gets on in the world. The polish of his romance gets worn off by degrees, it is true, but there is a deal of good solid stuff beneath that stands the wear and tear of the world well.

There was one little matter in connection with Colin's preparation for the service that brought the colour to his cheeks. In reading one day the regulations in the Navy List relating to the entrance of junior executive officers—in other words naval cadets—he came across the following rules:—

"Should cadets bring valuable gold watches or chains with them to the training-ship, they will be taken from them and placed in security until they return to their homes. Silver watches will be allowed to be used."

"Trousers to be made without pockets, and only one pocket on the left breast of the jackets of the two working uniform suits."

Colin bristled up at this. "Do they treat their junior executive officers then as infants?" he muttered. "No valuable watch! We dare not take an heirloom with us. Do they suppose we would sell it, or barter it with the bunboat woman for gingerbread or sugar-candy? No pockets in our clothes! Do they imagine we would fill them until they bulged out with lollipops and apples? Bah!"

Before Colin left his favourite seat in the pine wood, where he had spent so many happy days with his chosen authors, and—well, yes, his Arnold's Latin exercises—he knelt down and prayed; prayed a short and simple but earnest prayer for courage to ever do his duty; prayed for a strength that was not his own to guide him in every difficulty; prayed too for those he loved. He felt stronger in every way when he arose.

"When I'm a man," said he, half aloud, "and have won my epaulets, I'll come back to this same spot and pray."

* * *

Farewells were said next morning. Then Colin and his uncle, Captain Peter,

who had determined from the very first to accompany his young admiral south, started on their journey. He told his sister he wanted to see a ship or two once more, and have another sniff at the sea.

He was not dressed very modernly. Perhaps this is even a mild way of putting it, for when men come to a certain age they consider themselves quite independent of prevailing fashions; so the hat Captain Peter wore, although to all appearance as good as new, was quite antediluvian in build; that blue coat of broadcloth looked as whole and hearty as its wearer, and that is saying a good deal, but it was of a fashion and cut

advice for his conduct and guidance in the career that was opening out before him.

Now Colin was old for his years—in mind, I mean; for the lonely life he had always led at his Highland home had necessitated his falling back for pleasure and amusement upon books. He devoured all that came before him, so to a great extent he really had made himself acquainted with the literature of the day. And therefore, good although much of the advice was which his uncle was now vouchsafing, especially that portion of it which related to obedience to orders, strict performance of duty, manly forbearance towards his juniors, kindness

training-ship. Colin duly reported, and all the usual office preliminaries were gone through; then, after a chat with one of the officers in the ward-room, his uncle, followed at some little distance by Colin himself, was shown round the ship. Captain Peter scanned and criticised everything with the eye of a sailor. Well, probably he *did* talk a little louder than there was any occasion for; but Colin remarked, with a blush of shame for their insolent behaviour, that the peculiarities of his uncle afforded a deal of amusement to several of the cadets, and that they were merry at his expense even under his very eye. This led to an event, the like of which Colin would

"He could die sooner than have his dear old uncle made the butt of unseemly jokes."

peculiar, it may be presumed, to some bygone age, because no one living could remember the fellow to it; one leg was in a kind of knickerbocker of blue pilot, the other was the wooden one, and he carried in his hand a stick of such trusty dimensions that, if need be, it could have served as a boarding-pike.

The wooden leg had, for this memorable occasion, been scraped and stained, and finally varnished, by the captain's own hands. The work had cost him three whole days, and very proud he was when the job was finished.

When the carriage that was to bear them many miles to meet the coach which would finally land them at the distant railway-station had fairly left the castle, and Colin's grief was subdued if not assuaged, Captain Peter commenced at once to give his nephew

to the men under his command, etc., all that related to the actual life he would have to lead was most decidedly a mile beside the mark. For the service, and all about it, and in it, had altered completely since the days when Captain Peter had strutted the decks of a smart corvette in cocked hat, swinging sword, and much-bedinted spy-glass. The bluff old sailor had forgotten all that—in fact, he felt so fresh and young at heart that he could not conceive how the years had flown.

But to all his uncle said Colin listened with patience and respect. At another time he might have smiled at some of the advice, so out of place was it; but now—no—he loved the old man all the more for his very innocence.

Colin and his uncle reached the port at last, and the two together boarded the

have shuddered to contemplate the day before. In his passage round the ship good Captain Peter made frequent use of the words—

"When I commanded the old *Furore*."

Perhaps there was a slight ring of pride in them, which was excusable in so aged a sailor, and one, too, who had lost a leg in his country's cause. But the words and the tone also were duly remembered by more than one cadet.

Colin was allowed to go on shore and bid his uncle good-bye, as he started for Plymouth. He came off again in the evening in a shore boat, the fellows who brought him charging him only three times the usual fare. Being tired, and a kindly-hearted cadet some two or three years older than he offering to put him up to the ropes, it was not long before he was in his hammock and sound asleep,

and the next thing he remembered was some one shaking his hammock and delivering himself of the intimation that it was "Five bells, sir, please."

Colin soon became aware of where he was, and turned out, not very gracefully, it must be admitted—indeed, he really tumbled out. He fell on his nose, and this caused a good deal of smothered tittering and chaff. He was among the first up—some, indeed, could hardly be prevailed upon to turn out at all, and the quartermaster had to take the number of their hammocks.

Colin felt somewhat shy and uncomfortable withal, for he seemed in a hive of strange bees. He was not sorry, therefore, when Quentin Steele, the youth who had been his friend the night before, came half-dressed to say good morning.

Many were quite as slow at dressing as they had been at getting out of their hammocks, and got up and sat on their sea-chests frog-fashion; others laughed and chaffed, and others, again, lent themselves to actual practical joking. Colin heard his name mentioned more than once, and his country too, in a way that was intended to do neither much honour. He paid no attention at all, but went quietly on dressing. At last a

wet sponge struck him on the chest, entirely spoiling the breast of his white shirt. He felt chagrined, but made no remark. He simply placed the sponge in front of him beside his basin.

"Please give me my sponge."

He looked about, and saw a half-dressed cadet standing near him—a much smaller boy than even he was.

"Mind, I didn't throw it," continued the lad.

"No, I believe you," said Colin, aloud. "Cowards and bullies never throw their own things about."

Immediately after there marched up to him the bully himself; he was tall enough, in all conscience, but not at all hard-looking, and loosely knit together. He had tremendously long arms, though.

"I threw the sponge," he said, cheekily.

"Did you?" responded Colin, quietly taking his measure. "I thought as much. Well, I accept your apology before you speak. Go away and learn to behave better in future."

There was a general roar of laughter at Colin's coolness, amid which Master Burgess, or Bully Burgess as the smaller cadets called him among themselves, retired discomfited.

Not for long, though. The shouts of

laughing were soon renewed, and there was young Burgess strutting about the deck with an improvised wooden leg and a top-coat on.

"When I commanded the old Furore," he was saying.

"When I commanded the old Furore!"

He brushed past Colin as he spoke the second time. The result may be imagined.

Both were wounded in the tussle; neither eyes nor noses were improved, but the bully was worsted. Colin would never have fought on his own account, but he felt he could die sooner than have his dear old uncle made the butt of unseemly jokes.

Both belligerents were reported. The commander would be on board next day.

"Bring them up to-morrow at twelve," said the first lieutenant. "I will not interfere. I know he will punish them severely. Meanwhile the two young gentlemen must consider themselves under arrest."

Under arrest! The words fell upon Colin's ears like the sound of an avalanche that would soon bury him alive. Under arrest! What a beginning! Nay, but would it not rather be an end to all his hopes, to all his ambition?

(To be continued.)

CHESS.

(Continued from page 414.)

Problem No. 98.

By MRS. SOPHIE SCHETT.

White to play, and mate in three (3) moves.

SOLUTIONS.

PROBLEM No. 90.—1, K—Kt 2, B—Q 2 (or a). 2, Q—R sq. and 3, Q—Q Kt sq., mate.—(a) B—R 5. 2, Q×B, any move. 3, Q—B 6, mate.

PROBLEM No. 91.—1, P—Q 8 Kt, P—Q 8 Kt. 2, B×R P, P—B 8 Kt. 3, K×P, Kt moves. 4, Kt mates.—Without the KR Pawn there could follow 2, B×B P, P—R 4. 3, B—Kt 6 or R 7, and 4, Kt—K 3 mate.—If the Q R P were off, then White might play 2, B—Kt 6 or R 7, and by shifting the position one square to the left, in order to avoid

the double move of the B, White could play 1, P—Q B 8 becoming a Q, and mate at the fourth move.

GO-BAN.

GAME No. 3, page 221.—The play went on thus:—17, c 3—c 2. 18, f 1—g 1, h 2—h 1. 19, f 3—g 4, f 5—g 5. 20, e 6—f 5, c 4—c 5 (see a). 21, b 3—b 2, c 2—c 1. 22, b 2—c 3, d 3—d 2=five.—(a) If Black had played 20, e 4—f 5, then White would have answered c 6—c 5. White's 19th move might have been f 6—g 5, with which he would have won one move sooner.

GAME No. 4.

Played on the 7th of February, 1885, between L. H. S. (White) and H. F. L. M. (Black).

WHITE.	BLACK.
1. e 4.	d 5.
2. d 4.	e 6.
3. c 4.	f 4.
4. e 5.	f 5.

6. b 4.	a 4.
7. g 7.	h 8.
8. f 7.	d 7.
9. g 4.	c 6.
10. d 6.	b 5.
11. e 8.	g 5.
12. e 3.	d 3 (a).
13. f 7 e 7.	c 6 c 5.
14. g 7 f 8.	h 8 g 7.
15. e 8 d 8.	g 7 f 7.
16. f 8 e 8.	d 7 c 6.
17. e 8 f 8.	f 7 e 8.

WHITE.

18. d 8 d 7.
19. f 8 g 7.
20. e 7 f 8 (c).
21. f 8 f 7.
22. g 7 g 6 (d).
23. d 6 e 6.
24. g 6 h 5.
25. g 4 f 3.
26. h 5 g 5.
27. d 7 e 8.
28. f 7 g 6.
29. g 5 h 6.
30. c 4 c 5.
31. e 5 b 6 (f).
32. b 4 c 5.
33. f 3 e 2 = five.

BLACK.

- e 8 f 7 (b).
- g 5 h 4.
- f 7 g 8.
- e 6 e 7.
- g 8 g 7.
- c 6 d 6 (c).
- h 4 g 3.
- d 3 e 2.
- g 3 g 4.
- d 6 d 7.
- c 5 c 6.
- d 5 d 6.
- g 7 f 7.
- c 6 c 7 (g).
- e 2 f 2.

NOTES.

(a) The position of the white men appears to be the superior one.

(b) Black is obliged to come back (or play g 5 g 6), as otherwise White would win with e 7 f 7.

(c) A good move, which compels a black man to go near the corner.

(d) If White had played d 7 e 6, Black might have replied g 8 h 7 or f 5 g 6, but not h 4 g 5, for in this case White would have won in four more moves.

(e) The game is a tough one, since the men are so well mixed that there is no prospect of making a "five" just now.

(f) The only move.

(g) Black ought to have blocked the diagonal by b 5 c 5.

To Chess Correspondents.

G. A. S. H. (Tiverton.)—Solution of No. 87 correct, that of No. 88 incomplete, since you have omitted Black's best reply of 1, Kt to B 2. In each of these two problems the

K has seven squares of his territory free; in the problem by F. C. Collins he has also seven squares free, with the difference that in the latter he can *move* to as many squares. No. 88 was composed five years ago.

W. A. R. (Paris.)—The author of the book is J. Paul Taylor.

C. K.—Problem No 91 was composed in June, 1874, but in spite of its long waiting, it is, as you say, "as original as ever."

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE AURORA BOREALIS.

THE wreck of the Aurora Borealis is famous for the splendid rescue of her crew. That rescue is one of the grandest achievements of our lifeboat service. Jarman, the Ramsgate coxswain, headed many a daring enterprise in the cause of mercy, but he never did a more striking thing than when he picked the ten wearied Danes out of the rigging of the ill-fated collier on that bitterly cold January morning. The Board of Trade, in their grant to each man, showed what their own countrymen thought of the lifeboat heroes, and the King of Denmark in his gift showed what was thought of them by the countrymen of the rescued.

The Aurora Borealis was a small barque of 236 tons, hailing from Ribe, a port in Jutland. She was commanded by Captain Smith, and was on her voyage from Newcastle-on-Tyne to Messina with a cargo of coals, when, at half-past four on the morning of Sunday, 6th January, 1867, she went ashore near the Trinity Beacon on the Goodwins, on the south-east spit of the sands.

It was an unusually sharp winter. There had been a heavy fall of snow, and on the Saturday a gale sprang up which did immense damage all round our coasts. The night was intensely cold, and the blinding sleet was blown about so thickly at times as to hide every object in its veil. The sea ran fiercely, and the barque was simply caught by the waves and driven by the wind down on to the sands. Finding she was in danger, Captain Smith showed a bright light and made signals of distress, which were perceived on board the Gull lightship, and in consequence rockets were sent up acquainting the lifeboat men that their help was needed. This was about half-past eleven on the Saturday night, and the boat, which had only just returned from one rescue, went out to the other. When the boat got out the snow-storm was so thick that nothing could be done, and so she returned to wait for daylight. At eight in the morning the gale was still raging, but the lifeboat was launched, taken in tow by the tug, and finally found the Aurora Borealis heeled on to the sand with the seas making a clean breach over her. The flag of distress was flying, but there were no signs of the crew, who were taking shelter under cover of the deck-house. The wreck was in the centre of a most furious sea, and the tide was in full flow, so that the task of rescue was extremely difficult.

The tug took the lifeboat well up to windward and then cast off, and with sail up and cable ready down she came on to the ship. The anchor was let go and sixty yards of cable were run out. But before the wreck could be reached there came a huge billow which crashed down on to the boat, drove her under, and swept her over a hundred yards to leeward. Thus the first attempt failed.

The tug again took the lifeboat up into the teeth of the wind and cast off. Down she came, and again at the critical moment the waves seized her and swept her away. Thus the second attempt failed: and the rising tide had driven the Danes from the deck, and in the biting sleet they had lashed a spar in the mizen shrouds and were clinging to it and watching and dreading the failure.

The men shipped their oars, but they were wrenched out of their hands by the sea, and,

as the sail was useless in such a tempest, the lifeboat drifted to leeward and was again picked up by Simpson, who commanded the Aid. Again he battled with her into the wind and again she shot down on her errand. As she passed the ship a rope was thrown, but the distance was too great, and, for the third time, there was a miss. And all the while the waves were boiling round, and the wind was howling and actually shearing off the foam crests in its force.

The fourth attempt was differently managed. The steamer tried to tow the boat to the ship, but the danger proved too great; and, after rolling about with her gunwales under water, the cable had to be cut, and both tug and boat went away down the wind.

And now the decks burst up, and the sea was black with coal dust, and pieces of the fore-castle were forced off and borne about by the billows. The danger was pressing, and the fifth attempt was made. Simpson brought the Aid close down and tried to fire a line from the mortar, but before he could do so the steamer was seized and actually thumped down on to the sand by the angry sea. The tug was backed out of peril, and then the boat was picked up, and away they went for the sixth attempt. "We won't go home without them," said the men.

The story of the rescue has been so well and fully told by the Rev. John Gilmore, the rector of Holy Trinity, Ramsgate, in his "Storm Warriors,"* that we cannot do better than quote the last trial from that stirring record of lifeboat work on the Goodwins. It is so well known as a reading, that were we not to do so our account would seem to be but a bald and feeble abridgment. The quotation is from the chapter

"VICTORY OR DEATH."

* * * *

At last one of the men proposes a plan which must indeed either prove rescue to the shipwrecked or death to all.

"I tell you what, my men, if we are going to save those poor fellows there is only one way of doing it—it must be a case of save all or lose all, that is just it. We must go in upon the vessel straight, hit her between the masts, and throw our anchor over right upon her decks."

"What a mad-brained trick!" says one.

"Why, the boat would be smashed to pieces."

"Likely enough; but there is one thing certain, is there not? and that is that we are never going home to leave those poor fellows to perish, and I do not believe that there is any other way of saving them, and so we must just try it. And God help us and them."

Not a single word against it now!

What, charge in upon the vessel in that mad rage of sea! Victory or death indeed!

Most of the men on board the lifeboat are married men with families—loved wives and loved little ones dependent upon them. Thoughts of this, tender heartfelt thoughts of home, come to them.

"Well, and so we have, and have not those poor perishing fellows also got wives and little

ones, and are they not thinking of their homes and loved ones as much as we are thinking of ours? and shall we go home, having turned back from even the greatest danger, without having tried all it is possible to try; go home to our wives and little ones and leave them to perish thinking of theirs? No, please God, that shall never be said of us."

Such thoughts as these pass through the minds of some of the boatmen. And what think the poor nearly-drowned crew of the unfortunate vessel?

There they are, clinging to the loose and shaking rigging, a few feet above the boil of the hungry and raging sea. They have seen effort after effort made and effort after effort fail; they have watched the men do more than they ever dreamt it was possible for men to do; and they have watched the lifeboat live and battle with seas with which they never thought it possible a boat could for one moment contend; time after time they have thought the boatmen were drowned as they saw the huge curling waves break over the boat, swamp it, bury it in the weight of their falling volume of water, and for some seconds hide all from view; they have been watching the men persevere in attempt after attempt, when they thought that from sheer exhaustion it would be impossible for them to make another effort for their rescue.

With equal wonder and admiration they watched the noble efforts of the steamer, marked how nearly she was wrecked, and when she failed gave up all as lost; deciding in their minds that in such a rush of broken sea, strength of tide, and gale of wind, that it is impossible for the boat to reach them or for them to be saved, and all but one give up all hope. When the captain says in despair, "The lifeboat can never make another effort," this man answers, "I have sailed in English ships; I have often heard about lifeboat work, and I know that they never leave any to perish as long as they can see them, and they will not leave us."

"And, look! here she comes again! Oh, God help them! God help them!"

Yes, here she comes again; the steamer had hastened to tow her well into position, well to windward of the wreck. "And here she comes again."

Once more the boat heads for the wreck—this time to do or to die; each man knows it, each man feels it. They are crossing the stern of the vessel. "Look at that breaker—look at that breaker. Hold on! hold on! it will be all over with us if it catches us; we shall be thrown high into the masts of the vessel, and shaken out into the sea in a moment! Hold on all! hold on! Now it comes! No; thank God, it breaks ahead of us, and we have escaped. Now, men, be ready, be ready!" Thus shouts the coxswain. Every man is at his station, some with the ropes in hand ready to lower the sails, others by the anchor, prepared to throw it overboard at the right moment. Round past the stern of the vessel the boat flies, round in the blast of the gale and the swell of the sea; down below, round she comes. Down foresail! The ship's lee gunwale is under water, the boat shoots forward straight for the wreck, and hits the lee rail with a shock that almost throws all the men from their posts; and

then, still forward, she literally leaps on board the wreck. Over! Over with the anchor! It falls on the vessel's deck. All the crew of the vessel are in the mizen shrouds, but they cannot get to the boat, a fearful rush of sea is chasing over the vessel and between them and it. Again and again the boat thumps on the wreck as on a rock, with a shock that almost shakes the men from their hold.

The waves soon lift the boat off the deck

upon both ropes, cheer to the crew, "Hurrah, mates! hurrah!" All is joy and excitement, but at the same time steady attention to orders. Now the boat is abreast the mizen rigging, opposite to where the men are clinging. "Down helm! the boat sheers in; haul in upon the ropes, men, handsomely, handsomely." The boat jumps forward, hits the ship heavily with her stern, crashes off a large piece of her forefoot. The men are for a mo-

between the boat and the wreck; a second more and the boat will be on the top of him, crushing him against the rail of the vessel, upon which the keel of the boat strikes and grinds cruelly. Two boatmen seize him, leaning right over the gunwale to do so; they are almost dragged into the water; they are seized in turn by the men in the boat, and all are with difficulty got on board.

Up the boat flies and crashes against the

"Now for the grappling iron—quick! throw it over that line."

and carry her away from the vessel. "Is even this attempt to be a failure? No, thank God! the anchor holds; veer out the cable; steadily, my men, steadily; do not disturb the anchor more than you can help; we shall have them now! We shall have them. All will be well. Ease her a bit; ease her. See how she plunges; a little more cable. Now for the grappling-iron—quick! throw it over that line. There you have it!" And they haul on board a line which had been made fast to a cork fender and thrown overboard from the wreck early in the day, but which the boatmen had never before been able to reach.

They get the boat straight, haul in slowly

ment thrown down with the shock. Two of the boatmen spring on to the raised bow gunwale, and seize hold of the captain of the vessel, who seems nearly dead, and drag him in over the bows. Two of the sailors jump on board. "Hold on all! hold on!"

A fearful sea rolls over them, the boat is washed away from the vessel. The anchor still holds; they sheer the boat in again; they make the ropes fast, and lash the boat to the shrouds of the wreck, thus verily nailing their colours to the mast. No! they will not be washed away again until they have all the crew on board.

A sailor jumps from the rigging, the boat sinks in the trough of the sea, the man falls

spar lashed to the rigging. "Jump in, men, jump in all of you. Now! now!" In they spring and tumble, falling upon the men, and all rolling over into the bottom of the boat. All are now on board—all on board! "Hurrah! cut the lashings, then; she falls away from the wreck. Cut the cable! quick with the hatchet! All gone! all gone! Up fore-sail!" The seas catch the boat and bear her away from the wreck. Away she goes with a bound, flying through the broken water. The heavy wind fills the sail; they are fairly under way, and with the precious freight for which they had fought so long and so gallantly safely on board. Thank God! thank God! all are saved at last—*saved at last!*

OUR PARROTS.

(SECOND SERIES.)

THE plate of parrots presented with our last volume met with so warm a welcome that we are sure of a hearty greeting for the handsome group issued herewith, which completes the subject. Four hundred and forty-eight species of parrots are now believed to exist. Of these we have given examples of a hundred in full colours, and we have so described the rest as to render their identification comparatively easy. Our first plate was entirely occupied by specimens from Australasia; in this one the principal subjects come from South America.

The Green Macaw, or Military Macaw, *Sittace militaris* (No. 1), comes from Tropical America. It is one of the commonest of the macaws, and, like them all, has a very long tail and no feathers on its cheeks. The Peruvian Yellow-and-blue Macaw, or Buff-and-blue Ararauna (No. 2), *S. carulea*, forms a prominent object in the plate, as does the lovely hyacinthine blue of (No. 3) *S. hyacinthina*. Resembling the latter in form, but of a dull, dusty green, is *S. glauca*. *S. chloroptera* is the red-and-yellow species. *S. coccinea*, the red-and-blue macaw or aracanga (No. 4), is the largest of the parrot

family, specimens having been frequently measured of over a yard in length. *S. illigeri*, Illiger's Macaw, has a green back and wings, and, like *S. nobilis*, the Noble Parrot (No. 5), the golden-naped macaw, *S. auricollis*, and the small brown-fronted macaw, *S. severa*, is often seen in this country.

Of exactly the same colour as the breast of the Yellow-and blue Macaw is the Golden Conure (No. 6), *Conurus luteus*. The gold-crowned conure, *C. aureus*, is of a modest green colour, with just a little patch of gold above its beak, which patch in *C. haemorrhous* is replaced by a blue one. The yellow-headed conure (No. 7), *C. pyrocephalus*, is perhaps the most gorgeous of his race. Very similar to him, but with a golden back, is *C. solstitialis*, the Guaruba, or Sun parakeet. One of the conures, *C. byroni*, the Chilean lory, is found in Patagonia, and has what looks like a great-coat of bottle-green, with an ermine order of office thrown over his yellow under-clothes. In *C. carolinensis*, the Carolina or Illinois parrot (No. 8), we have the only parrot found in the United States. It is the most northerly, as *C. byroni*

is the most southerly parrot. In the island of St. Thomas is found *C. pertinax* (No. 9). *C. ocellaris*, the eyed conure, is a Central American specimen, in which the yellow of *C. pertinax* is replaced by a dirty brown; *C. petzi* has a blue-and-orange cap; *C. cactorum*, the Cactus conure, which has a dark-green face; *C. chrysophrys* has yellow cheeks; *C. aruginosus* has a brown throat; *C. tiri-acula*, the All-green Parakeet of Guiana, is a conure with a few blue wing feathers. The black-headed conure, *C. melanocephalus* (No. 10), comes from Venezuela. *C. wagleri*, from Paraguay, has no black about it, but has a cap and necktie of red.

Allied to the conures is the slight-billed parakeet of Chili, *Henicognathus leptorhynchus* (No. 11), the sole representative of the genus; and then we reach the Pyrrhuras, one example of which, *P. vittata*, is figured at No. 12. *P. cruentata*, the red-eared species, has a plain green breast and blue-throat; and *P. smaragdina*, often called the Chilean conure, is all green except its tail. In No. 13 the Monk Parrot, or Grey-breasted Parakeet, *Bolborhynchus monachus*, and in No. 14, *Psittacula passerina*, the Sparrow

Parrot, we have a single representation of two genera, which, like *Brotoperys*, are very similar in characteristics and of little importance. With them the seven genera—*sittace*, *conurus*, *henicognathus*, *pyrrhura*, *brotoperys*, *bolborhynchus*, and *psittacula*, which make up the *conuridae*.

Our next great group is the *Pionidae*, the first genus of which, *Triclararia*, has only one representative, and that we give, *T. cyano-gastra* (No. 15). There is also only one genus of *Pachynus*, *P. brachyurus*, which is all green, with a small patch of scarlet at the shoulders. Of the next genus, *Eucinetus*, we give *E. pileatus*, the Mitred Parrot from Paraguay, as an example (No. 16); *E. histrio*, the Hooded Parrot, has gold lacings on its neck; *E. vulturinus* is of very vulturine look, and has red tips to wings and a yellow collar. *E. amazonicus* is the little Amazon, and has red cap and throat, red shoulders, and dark-green nape. Closely allied to *Eucinetus* is the genus *Euchrourea*, and of it *E. cingulata* (No. 17), the Black Wing of Venezuela, serves as the type. Like it is *E. surdus*, but it has golden feathers in its tail. *E. viricaudus* has a blue patch on the back, and a green-and-red tail. *E. barra-bandi* has a black head with golden cheeks.

We now reach the representative genus of the *Pionidae*, *Pionia*. In No. 18 we have the Restless Parrot of Brazil, *P. tumultuosus*. Similar to it, but with green head and red bill, is *P. corallinus*. *P. violacea*, the Dusky Parrot, has brown wings and a brownish-red body. Of the Maximilian Parrot, *P. maximilianus*, we give an example in No. 19. In the Sordid Parrot, *P. sordidus*, the breast is brown. In the White-headed Parrot, *P. senilis*, the breast is green and the head is capped with white. Massena's Parrot, *P. gerontodes*, has a pink-and-white spotted cap. There are also the blue-headed, yellow-beaked, and bronze-winged *Pionias*. They all hail from Brazil. The angry-looking Hawk-headed Caique, *Derophtus accipitrinus* (No. 20), is another member of the *Pionidae*, but comes from Surinam and the more northerly districts.

The Festive Parrot, *Androglossa festiva* (No. 21), is the first of a new and important genus, that of the Amazons, of which good examples are also given in Levaillant's Amazon, *A. levaillanti* (No. 22), and the Spectacle Parrot, *A. albifrons* (No. 23). Bodin's Macaw, *A. bodini*, belongs to the same family, and has a red cap instead of the blue headpiece of *A. festiva*, and the throat is all green. The Yellow-Shouldered Amazon, *A. ochroptera*, has golden caps to its shoulders, but, unlike *A. levaillanti*, its head has a green back. The Orange-winged Amazon, *A. amazonica*, has the yellow cap of *A. ochroptera* split into two by a blue bar over the beak, so that the bird seems to have received the tonsure; its wings have blue edges, and in them is a slender slip of red. The Blue-fronted Amazon, *A. aestiva*, has a yellow chest and red tips to its shoulders, and the Yellow-lored Amazon, *A. xantholora*, differs from *A. albifrons* in having no blue cap, and in having its white poll edged with gold. The Mercenary Parrot, *A. mercenaria*, has the feathers on its neck of slate-colour laced with black, red and yellow tips to its tail, and just a few red feathers in its wings; and the Red-tailed Parrot, *A. erythrura*, has a red-and-orange poll, a purple face, and a red-and-green tail. From Dominica comes *A. augusta*, the Haughty Amazon, with purple breast and russet-and-steel-blue head; from Venezuela comes Bodin's Amazon, *A. bodini*, with all green body, red poll, and azure face; and from Guiana comes *A. ochrocephala*, the Yellow-headed Amazon its name implies, but which also has red and purple tips to its wing-feathers.

The Domingo Amazon, *A. ventralis*, is shown at No. 24; *A. leucocephala* (No. 25) is the White-fronted Amazon from Cuba. The Mealy Amazon, *A. farinosa*, has no dark

ears, and the crown is yellow and red, while the neck is edged with blue; the Guatemalan Amazon, *A. guatemalensis*, has a blue cap; *A. vinacea* has a green cap and a brownish breast; *A. viridigenalis* is not unlike the Cuban bird, but has a grey cap; the Yellow-cheeked Amazon is either *A. autumnalis* or *A. xanthops*, shown in the plate at No. 26.

Of the African genus *Psephenophus* we give Meyer's Parrot, *P. meyeri* (No. 27). Like it, with yellow breast and ashy throat, is the Senegal Parrot, *P. senegalensis*. Ruppell's Parrot, *P. ruppellii*, has no green on its breast. Levaillant's Parrot, *P. robustus*, is of larger build, with bright-green chest and red on the frontlet. When this bird has a yellow cap and yellow tips it is known as *P. guillemi*, or the Congo Parrot. From Abyssinia comes *P. citrinocapillus*, the yellow-headed species; from Somali Land *P. rufiventris*, with red breast and brown head and shoulders; and from Zanzibar *P. fuscicapillus*, with brown head and green breast. Of the sub-genus *Caica*, the representative of *Psephenophus* in South America, we give *C. melanocephala* (No. 26), the Black-headed Caique from North Brazil differing but in its black cap from its pale-headed cousin, *C. leucogastra*, the commoner species of the south. *C. xanthomera*, a Venezuelan species, has a dark-orange cap instead of a black one. With the three Caiques—all there are—we end the *Pionidae*.

And now we get to the arch-parrot himself, *Psittacus*, the chief of the *Psittacidae*, *P. erithacus* (No. 29), the talking grey parrot of our "funny stories and curious facts." Like him, an African, is *P. carycinurus*, the Tunisian Parrot, with a white upper beak. In the Vasa Parrakeet, *Ceracopsys obscura* (No. 30), we have what is really a black variety of *Psittacus*.

And so, having given due prominence to Poll the loquacious, let us hasten on to a much larger family, the ancient birds, the *Palaeornithidae*, one of which, *P. eupatrius*, was brought from India to Europe by the captains of Alexander the Great, although the Java Parrakeet, or Gingi Parrot (No. 31), *P. alexandri*, has received the conqueror's name. *P. eupatrius* has a red nape to its neck, green on its head, and a green breast. Very similar to the Gingi, but with no red under beak, is the Cochlin China Parrakeet, *P. fasciatus*. The Blossom-headed Parrakeet, *P. cyanocephalus*, has a red-and-purple hood and a grass-green breast. In *P. torquatus* we have the ring-necked species (No. 32), and in *P. longicauda* (No. 33) the Malaccan representative. With *P. erythrogenys* (No. 34) we are in the Nicobar Islands, where also flourishes his cousin, *P. caniceps*, whose head is grey instead of green, and whose cheek is yellow instead of red. *P. peristerodes* (No. 35) is the Malabar Parrakeet. *P. rosa* is the Burmah Parrakeet, red in the face, blue in the head, and green in the body, and with a necklace of black instead of black and green. A cousin of his with a black head is called Hodgson's Parrakeet, from the Himalayas, and another with a dark-green head is Gironier's, from Ceylon.

And now we come to the African Love Birds. *Agapornis roscicollis* (No. 36) is the rosy-faced one. The Abyssinian one, *A. taranta*, has a green face, the Liberian Parrot, *A. swindereni*, has a black band on its neck, *A. pullaria* (No. 37) is the West African Love Bird, and *A. cana* (No. 38) is the Madagascar one. The rest of the *Palaeornithidae* were described in the previous article.

With *Coriphilus* we enter the great family of the Lories, the *Trichoglonidae* of which we have already said so much. *C. solitarius* (No. 39) is the Solitary Parrot of Fiji, *C. taitianus* (No. 40) is the White-throated Lory of the Society Islands, *C. smaragdinus* (No. 41) is the superb lory of the Marquesas, *C. australis* (No. 42) is the Blue-crest of the Friendly Islands; and *C. kuhli*, the Ruby Lory (No. 43), the loveliest bird that flies, comes

from an as yet unnamed islet near Washington Island. Another beautiful creature, the Margaret Lorikeet from the Solomons, is No. 44, *Trichoglossus margarita*.

Domicella is another lovely genus. Of it in the former plate we gave *D. atra*, the Black Lory of New Guinea, as an example. Herein we have *D. histrio* (No. 45), the Indian species from Saugor Island, *D. rubra* (No. 46) from the Moluccas, the Orange-coloured Lory, *D. fuscata* (No. 47), from New Guinea, and the gorgeous Cardinal Lory, *D. cardinalis* (No. 48), from the Duke of York and Solomon Islands. The Fijian Masked Parrakeet, *Platycercus personatus* (No. 49), is given as a further example of the broadtails. The Shining Parrakeet, *P. splendens*, which also comes from Fiji, has a scarlet breast in place of the crimson. In the Pompadour or Tabuan Broadtail, *P. anna*, the crimson is of a very dark shade. As complementary to our other series we have added a figure of that curious bird the Blue-eyed Cockatoo, *Plissolophus ophthalmicus* (No. 50), which reaches us from New Britain.

And here our rough notes on parrot identification must end.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Writing Competition.

(Continued from page 448.)

SENIOR SUBDIVISION (ages 18 to 21).

Extra Prize—Half-a-Guinea.

WILLIAM E. MILTON (aged 20), 3, Friary Terrace, Brewery Lane, Derby.

Certificates.

VANCITTERS F. RIDDLE, Town and County Bank, Rhyne, N.B.

A. H. W. MANNING, Barrington Street, Tiverton, Devon.

JOSEPH W. WRIGHT, Harleigh House, Bodmin.

GEORGE H. ROBERTS, 7, Augustus Square, Regent's Park.

G. F. W. IRVING, Ravenswood, Coombe Lane, Croydon.

BERNARD SHAW, 36, Elmwood Street, Leeds.

ARTHUR A. MELVILLE, 18, Wills Street, Hunter's Lane, Birmingham.

EDWIN G. CHATT, St. Mary's C. E. School, Gateshead-on-Tyne.

HERBERT H. HOLT, 1, Little Russell Street, Bloomsbury Square, W.C.

JOHN W. SETHFIELD, New Square, Chesterfield.

WM. H. VENN, Red House, Coventry.

HARRY AMBLER, 36, South Hill Park, Hampstead, N.W.

W. H. TUCKER, 2, Colworth Road, Leytonstone.

EDWARD H. DEE, Beulah Lodge, Henley-on-Thames.

WM. R. GRANT DEAR, 30, Cumberland Street, Barnsbury, N.

GEORGE CLARK, 4, Wheatly Terrace, Erith, Kent.

WILLIAM BEVAN, Ardour, St. Matthew's Road, Cotham, Bristol.

SAMUEL D. REED, 2, Phoenix Street, N.W.

FRED. W. DEANE, 235, Great Colmore Street, Birmingham.

JAMES R. PHILLIPS, 1, Wellesbourne Grove, Stratford-upon-Avon.

LEWIS FARLEY, 94, Tank Road, Spring Gardens, Reading.

FINLAY MACKENZIE, Advertising Department, "News" Office, Glasgow.

JAMES P. EWING, 24, West End Park Street, Glasgow.

HARRY J. ROFF, Meyrick Crescent, Mersea Road, Colchester.

PERCY O. SUTTON, Norman Street, Dover.

FREDK. W. LE FEVRE, 73, St. Peter's Road, Great Yarmouth.

G. H. DOUTHWAITE, 9, Crescent, King Street, Leicester.

H. J. SEAMONS, 11, Granville Terrace, Mayes Road, Wood Green, N.

H. BLACKWOOD, Halifax, Nova Scotia.

JOHN J. BIGG, 61, Mount Pleasant, Barrow-in-Furness.

IVON M. MILLIGAN, 63, Queen Street, Castle Douglas, N.B.

JOSEPH G. WOOD, 34, Oliver Street, Stockport.

ENOS T. BLETHLEY, 11, Northgate Street, Gloucester.

H. L. MCMASTER, 30, Medina Road, Finsbury Park, N.

W. J. TAYLOR, 55, Forsyth Street, Greenock, N.B.

JOHN U. RANSOM, 12, Ashburnham Road, Bedford.

JOSEPH S. ARNOLD, 16, Lower Lyon Street, Newtown, Southampton.

WM. GOODCHILD, 24, Shacklewell Lane, Dalston.

DAVID MCINTYRE, 227, Paisley Road, Glasgow.

WILLIAM BAINES, 173, Denmark Road, Greenhays, Manchester.

ARTHUR THOMAS SPEAR, George Street, Uxbridge.

WILLIAM GREEN, 17, Lodge Road, Southampton.

THE "BOY'S OWN" GORDON MEMORIAL FUND.

WITHIN the past few weeks we have received quite a number of letters from various parts of the country, and from writers of all ages and conditions in life, urging that we should open a Boys' Gordon Memorial Fund in our columns. Says one adult correspondent, H. M. S. P., and his letter fairly represents very many others:—

Will you allow me, through the medium of your valuable paper, which richly deserves the position it holds in the literature of our boy world, to appeal to the possible future heroes of the nation—the boys of Great Britain—on behalf of a "Boys' Gordon Memorial," which I would suggest might take the form of a "HOME" for the boys of Outcast London? I can, from my experience of boys, safely say that ninety-nine out of every hundred in a position to do so, would willingly help in aiding to a "better life" those of their poorer and less fortunate brothers who are so greatly handicapped in the race by being born and bred up in surroundings of poverty, sin, and wretchedness.

Then our boy readers are equally solicitous. Thus H. W. B. wrote:—

Why should not the readers of the BOY'S OWN PAPER erect a memorial to the memory of the much-lamented General Gordon? If they can place two Lifeboats on our coast, and a Cot in a hospital, surely they can erect a memorial in honour of so great and noble a hero.

And yet another, C. A. B., writes:—

I think the boys of England ought to have a fund among themselves, because I feel sure they would like to pay their especial tribute of respect to the memory of so great a hero, whose noble Christian life offers the most stirring example to the future men of England.

To so many earnest appeals we feel we could hardly turn a deaf ear, even if our own sympathies were less warmly identified with the object espoused; and we have resolved, therefore, at once to start a Special "Boy's Own" Memorial Fund. The proceeds will be wholly applied in accordance with Gordon's known wishes—that is, for the benefit of poor boys. In our next number we hope to give full details of the project; and in the meantime we are preparing collecting cards, etc., to be issued under the same conditions as in our Lifeboat Fund.

DOINGS FOR MAY.

THE POULTRY RUN.—Summer is coming. Both cuckoo and nightingale have been telling us that for some time past, and as it is in the common course of nature that summer should follow spring, we are bound to believe them. We should, at all events, be well prepared for the summer season, though it is unlikely we shall have a repetition of the fiercely hot weather of last year. Hatching birds for showing is now nearly over unless for the very latest of them; but hens will sit now well, and the eggs will very likely be nearly all fertile. The nests should be put on the earth, with some nice straw over them. Those nest-boxes we talked about last month can easily be made by any handy lad who possesses, as every boy should, a set of tools. Remember that they have no bottoms, and that they are very well ventilated. But baskets with the bottoms knocked out do equally as well, only they must be heavy enough. These nesting-boxes or baskets are only required where you have a lot of fowls sitting. Few boys will need them, therefore.

You must feed your sitting hens well. That is, put maize and grains near the nest, and also clean water. They will come off to help themselves. The reason for giving hard food is that it digests more gradually.

Now, continue to attend well to the feeding of chickens, both young and old, and sort them out—we mean the half-grown ones—putting the cockerels in one place and the pullets in another. As soon as cockerels that you don't want to keep for stock purposes are big enough for the market, pen them up and fatten them off; or if you do not care to pen them, put them, at all events, into a place by themselves, and feed them five times a day on oatmeal mixed with fat or suet, rice with milk and treacle, or, indeed, any kind of wholesome food they will eat, but let it be of a starchy nature, with fat combined with it.

Do not expose your fowls of any sort to rain and

storms. Remember, too, that there are still frosty nights to be guarded against, so shut the doors at night. Give plenty of green food to all the inmates of your run. Now is the time they also begin to enjoy a grass run.

Beware, however, of fattening laying fowls. They must be well fed and in fair condition, but not fat. It would be well now to begin the summer cleaning and beautifying. If you have a long wire run, there is no creeper that you can plant outside it more charming or useful than the common wild convolvulus. You have only to get the roots and place them in a long layer along the foot of the fence. Put three or four together. They soon grow up, and the effect is most charming. It also gives shade to the run.

See to your dust-bath again. Do not forget the sulphur, taking care it is secure against leakage, and proof against a heavy thunder-shower.

See to the ventilation of your fowl-house. It is a fact that should not be forgotten that fowls kept in a well-ventilated, comfortable, clean house, with good perches and clean straw in the nests, seldom if ever ail.

Just a word about overcrowding. Much sickness is caused in this way. Neither the fowl-house itself nor the run should be overstocked; if they are your supply of eggs will suffer, and your chickens will neither thrive nor grow.

Diarrhoea may commence this month. It is a complaint that is best tackled in the bud. And at first it is easily managed by changing the food, giving less green food, and mixing bone-meal with their soft food. The great firm of Spratt keep the best bone-meal. You should never be without a tin of it. It is used also for growing chickens.

By the way, we happen to know that Spratt's Patent have a small guide to the fowl-run. It costs, we be-

lieve, threepence. It is a most valuable *multum in parvo* to have for ready reference.

When you collect eggs for keeping, put them carefully away in a drawer, setting them among bran, with the small end uppermost. If they are for any special purpose it is best to mark day and date of their arrival on them.

THE PIGEON LOFT.—Your loft or house in the garden will now be doubtless very nice. If you have a long flight in front of a garden pigeonry, with perches and everything complete, you can increase the beauty of it, and also give the birds shade, by planting creepers outside. The trailing nasturtiums look very nice; and although they do not come up very early, they will last till November. The common wild convolvulus may also be used as we recommend above for the fowl-run.

Well, inside and out your pigeonry ought now to be perfect. But if you have delayed any repairs set about them without fail immediately. You might make a new flight if you have the money to spare for the wirework. It only costs about sixpence a yard the best, two and a half feet wide. Never mind if the posts look rough, so long as they are useful.

Do not forget gravel to the floor of your aviary. All birds need this, just as all birds and beasts ought to have a daily supply of fresh water.

Attend well to the general comfort of the loft, and see that there is always plenty of food in the hoppers for the morning meal, for your pigeons will breakfast long before you. The young will also need attention lest they be getting starved.

THE AVIARY.—The birds will be busy breeding now. The principal work of the month will be to see that everything goes on regularly, that there is perfect cleanliness of the cages and food-tins, and a daily supply of fresh water placed in clean, well-rinsed fountains. You ought to have a good supply of seed in. Keep it in pickle-jars unless your judgment can suggest anything better and handier.

Have your nursing-cages ready; you may want them, and they are exceedingly handy if you are going in for breeding to any extent. It will now be time to think about mule-breeding; the goldfinch and canary mule is an exceedingly pretty and interesting addition to the aviary.

Two ailments you must look out for this month and next, namely, sweating and egg-bound. The latter usually is caused by weakness in the bird and an overheated condition of the body. But the young are the principal sufferers. You must endeavour, by an arrangement of sticks on the nest, or twigs, to prevent the hen sitting too close down on the birds. Put a few drops of tincture of steel in the drinking-water, or what does as well, a rusty nail. Egg-bound is also the result of weakness. Hens that have not been in good condition when paired, or that have been kept in too warm a room, are more likely to suffer from it than others. The hen at all events fails to lay her egg, and sits long on the nest in a state of great suffering. The usual remedy is to take her gently up, and, after touching the vent with olive-oil, hold her gently over the steam of hot water in a tumbler. Give extra generous diet, and put a tonic in the water.

THE RABBITRY.—We must remind our readers in this branch that the more exercise and fresh air and sunshine rabbits now have the better. They will run in from summer showers. They are very careful over their wool, only see that you have a place for them to run to. Be careful now with your feeding. A little rack should be placed in the hutches, from which they can pull down sweet hay and clover. This is a better plan than letting them have it among their feed. We must learn economy even in the feeding of rabbits. Be most careful to give no wet green food, and do not permit high-bred rabbits to run about in damp grass. The nights will still be cold, and we may have frost. So keep the rabbits comfortable.

We said a word or two in last month's DOINGS about warrens. We feel sure that, under favourable conditions, it would pay to keep rabbits in a semi-wild state. You want mongrel-bred rabbits of any kind, and bucks as big as possible. The best plan is to breed them indoors, and turn them out about ten or twelve weeks old. Of course they will want food in addition to what they pick up.

THE KENNEL.—Continue as before to exercise well, and keep comfortable. The best times for feeding are eight o'clock in the morning, dry biscuit; and five o'clock in the afternoon, steeped biscuit with scraps or gravy.

DOMESTIC PETS.—Rats and mice, white or piebald, make very excellent pets for boys. They will not smell high if they have proper cages and are cleaned out regularly. The rats will eat almost anything. Here is a good hint about mice. Let canary-seed be the staple of their diet, and they will not smell.

THE KITCHEN GARDEN.—Everything will be growing apace, weeds included. Declare war against the weeds, and keep it up until December comes to kill them with its frosts. Continue to sow peas, and now get your French beans in. These make very pretty climbing plants. We like to see them over arches, the white and red together; the flowers are very pretty. Plant greens of all kinds. Earth up potatoes, and get your vegetable marrows put in. These last must have sunlight and plenty of air.

THE FLOWER AND WINDOW GARDENS.—The main work of the month in both these will consist in planting out, arranging beds and borders for effect with foliage or flowers, and keeping the earth well stirred, and killing weeds. There is time yet to plant nasturtiums, tropeolums, etc. Some of the bright-red tropeolums look charming in baskets.

C. RUSSELL.—1. Soak your paint-brushes in raw linseed oil for twenty-four hours, and rinse them out in hot turpentine; or wash them in hot soda-and-water and scf-soap. 2. The reason that the upper part of Somerset House is whiter than the lower, is that the lower part is built of good stone which stands, while the upper is built of stone of an inferior description, though probably from the same quarry, which shales off under the influence of the weather, and so exposes a fresh surface. The same amount of London smoke and dirt settles on both upper and lower parts.

S. W. T.—A letter addressed Mr. Cross, Menagerie, Liverpool; or Mr. Jamrach, Menagerie, St. George's Road, London, E., will procure full particulars as to monkeys for sale.

G. W. M. and C.—Your chance of success there would assuredly be no worse than here, but you would not have so good a base to fall back on in the event of failure. Do not, however, fall into the usual mistake of supposing that America means New York, and that the cost of getting to the Western States, where labour is fairly plentiful, is the same as that of crossing the Atlantic. America is a large place, and to reach likely ground you will require at least five times the amount of your fare across the hering-pond.

P. O. B.—Quite a mistake. So far from the American States being equivalent to our counties, they are each equal to our country. Each of the States is divided into counties, and it is these counties that answer to ours. It is much the same, in fact, as if England, Scotland, and Ireland formed the United States of Great Britain.

PARSON, BOSHER, AND CO.—The monthly parts are obtainable, but the special Christmas parts are out of print.

FIDELIS and Others.—The competitions are open to all bona-fide readers.

J. L.—The design for the fretwork cover of the "Boy's Own Annual" can be enlarged by means of the pantograph, described in the fifth volume.

H. G.—Letters on such subjects should contain full name and address. We are obliged for the offer, but our arrangements are made for some time to come.

G. FAULKES.—Nearly all good booksellers have a copy of "Josephus" in stock. There is a five-shilling edition published by Nimmo. Ward, Lock, and Co. have also recently issued an edition.

A WORKING LAB.—Impossible! We cannot fill our columns with copies of examination-papers, no matter how interesting they may be to a certain section of our readers. If you want the papers, get them from the Queen's Printers, dig them out of Blue Books, or consult some manual in which they are included—and answered.

E. J. BRAY.—The tiles must be laid in cement, but it matters very little if the cement has a stone backing, and it would be hardly worth while to remove it. Try them with the stone in place, and if that does not do you can remove it.

HERON.—Order the volume through a local bookseller, and the carriage will cost you nothing.

EDVARDUS.—1. The author of "The Crew of the Nancy Brig," and "The Bos'n Tight and the Midshipmite," etc., is Mr. W. S. Gilbert. You will find it in the "Bab Ballads." 2. Ireland's heraldic colour is blue, not green. See our article on the National Arms in the third volume.

S. Y. V.—The White Cloud Mountain is at Canton. It is the Chinese holy of holies, whither the dead bodies are sent from all parts of the world. Frequently fifteen hundred corpses will arrive there in one day. The steamboat company charges forty dollars for the passage of a live Chinaman, and one hundred and sixty dollars for a dead one.

D. C. T.—Average, in a commercial sense, means damage at sea to ship or cargo. Particular average is payable by the underwriters for partial loss, against which insurance has been made; and general average is payable by the owner for goods lost or destroyed in ensuring the safety of the ship. Average accustomed is the charge for pilots, lights, etc.

J. DAVIDSON, and TRY.—1. You must make the choice for yourself. We know nothing for or against the association you inquire about. Many men fail in the colonies; but, then, many fail by moving into the next street! 2. The Civil Service is over-crowded now, and will be more so in the future. The only Government employments in which the supply will never exceed the demand are soldiering and sailing.

B. REECE.—The best plan to adopt would be to watch the advertisements in the "Exchange and Mart," and have the dog sent on approval.

FARMER JACK.—1. The presentation plates are bound up in the volumes as sold by us. 2. The home manufacture of fireworks is now illegal. You can buy fireworks; you must not make them.

G. W. LACEY.—For the papers on Ventriloquism see the first and second volumes.

YORKSHIRE NEWSMONGER.—1. You will have to become a student on the Marlborough, and your best plan would be to apply for particulars direct to the Admiralty. 2. A good set of photographic apparatus, instantaneous, can be obtained for a couple of guineas. Apply to any of the camera-sellers.

T. FISHER.—The legend of the olive is that Neptune and Minerva both wished to found a city where Athens now stands. The dispute was referred to Jupiter, who decided that the privilege should be granted to whichever of the appellants should bestow the most useful gift on the future inhabitants of the city. Neptune struck the earth with his trident, and up sprang a war-horse; Minerva then called up the olive-tree. Verdict for Minerva: olive-tree to be henceforth badge of Athenians.

I. L. X.—1. Morocco leather is made from goatskins. 2. The Exmouth training-ship is at Gray's Thurrock. The office is at 37, Norfolk Street, Strand. 3. The "family name" of Hawkeye was Bumpo—Natty Bumppo. He also appears in "The Pathfinder" as the Leatherstocking, in "The Prairie" as the Trapper, and in "The Deerslayer."

NAPOLÉON can get Chapman's "All about Ships" from any nautical bookseller; and Dana's "Two Years before the Mast" from Messrs. Warne and Co. The idea of choosing a "smooth month" to start a sea life in is likely to lead to disappointment. Boys are apprenticed to firms, not to particular ships. A knowledge of geometry is essential.

C. H. WEARING.—The fossil is a piece of the Silurian chain coral (*Halysites catenularius*). The pattern is due to your having obtained a horizontal section. Break a piece off at right angles, and you will see the true position of the septa.

A WORKING BOY.—You have got the diaphragm in the wrong position. Shift it until you find the disk free from cloud. With disk, diaphragm, and lens, clearness is only a matter of distance, providing your light is strong enough.

HORNS.—Tripoli is polishing-powder. Try at a tool-shop if the oilmen fail.

A. S. PARR.—If you have read the paper for three years you can refer back and read the article on tattooing in last volume. You will there find that you cannot remove the marks you have so foolishly disfigured yourself with.

FLYING.—England has the fastest trains in the world, and their rates and distances you can ascertain for yourself from an ordinary railway guide.

C. H. MARTIN.—1. The frost on Christmas cards is obtained by dusting powdered glass on to a coat of half-dry gum. 2. Try a wash of carmine, or perhaps burnt sienna.

W. C. S.—1. To stop a small leakage in a model, use gold-size putty, made by mixing up whiting, white-lead, and gold-size. 2. The best paint for boilers is red-lead.

F. T. SISSONS.—You should never send riddles to magazines without their answers. How can their quality be judged until they are complete? Wait half a dozen years and then try.

RAY FORD.—The only way we can suggest for you to find out where your friend is buried is for you to advertise in the London morning papers.

STAR OF THE SOUTH.—The Australasian Colonies offer the best opening for men with definite trades.

S. SMITH.—1. Extract of meat is made by chopping very small a pound and a quarter of lean meat recently killed and heating up gradually till it boils in a gallon of water, then letting it simmer for a few minutes, and straining it through a hair sieve while still hot, and then evaporating it to a soft mass. 2. The simplest way of fireproofing wood is to dry it thoroughly, and then give it a coat of limewash. 3. Yes, there are such things as fireproof paper and fireproof ink.

N. N.—1. Probably too small for a Gazetteer. Newnham Murren is on the left bank of the Thames, near Wallingford Bridge, about twenty-two miles from Oxford. 2. Achromatic objectives are cemented together with Canada balsam. 3. Impossible; no ship is allowed above Blackwall with more than twenty-five pounds of powder on board.

JOHN.—You will find all about Joe Gargery and his "meantersay" in "Great Expectations," by Charles Dickens.

ENTHUSIAST.—The polish on tool handles is either hard varnish or friction polish put on in the lathe.

TWELVE MONTHS' SUBSCRIBER.—Beeswax is made by bees, not by men, and you buy it at an oilshop.

HONEST LIVING.—One of the Civil Service guides, obtainable at most booksellers', will give you the information in detail.

E. N. L.—1. There are several substances besides water that are lighter in their solid than in their liquid state. Tin, for instance, will rise through liquid tin; zinc will float on liquid zinc; bismuth will float on liquid bismuth; and copper and iron also show a slight difference. 2. Aluminium bronze was discovered by Dr. Percy, and consists of ninety parts of copper and ten of aluminium. It is used for imitation gold pencils and the working parts of machinery, for which it is equal to the best steel.

** With our next Monthly Part we hope to publish life-like Portraits, in Colours, of General Gordon and Lord Wolsey.

E. W. SHENNAN.—The impressions are those of Maunday money—silver pennies, twopennies, threepennies, and fourpennies—given away every year at the Chapel Royal by the Queen's Almoner on Maunday Thursday. The coins are a survival, not an experiment.

A GREAT ADMIRER.—The side of the wicket you bowl from is a matter of taste and style, and it is impossible to lay down any fixed rule. Some men bowl best over the wicket; others can get no break on the ball unless they bowl round.

No. 329.—Vol. VII.

SATURDAY, MAY 2, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER V.—THE CRUDENS AT HOME.

IF anything could have made up to the two boys for the hardships and miseries of the day it was the sight of their mother's bright face as she awaited

them that evening at the door of No. 6, Dull Street. If the day had been a sad and lonely one for Mrs. Cruden, she was not the woman to betray the secret to

her sons; and, indeed, the happiness of seeing them back was enough to drive away all other care for the time being.

Shabby as the lodgings were, and lack-

Mrs. Captain Shuckelford.

ing in all the comforts and luxuries of former days, the little family felt that evening, as they gathered round the tea-table and unburdened their hearts to one another, more of the true meaning of the word "home" than they had ever done before.

"Now, dear boys," said Mrs. Cruden, when the meal was over, and they drew their chairs to the open window, "I'm longing to hear your day's adventures. How did you get on? Was it as bad as you expected?"

"It wasn't particularly jolly," said Reginald, shrugging his shoulders—"nothing like Wilderham, was it, Horrors?"

"Well, it was a different sort of fun, certainly," said Horace. "You see, mother, our education has been rather neglected in some things, so we didn't get on as well as we might have done."

"Do you mean in the literary work?" said Mrs. Cruden. "I'm quite sure you'll get into it with a little practice."

"But it's not the literary work, unluckily," said Reginald.

"Ah! you mean clerk's work. You aren't as quick at figures, perhaps, as you might be?"

"That's not exactly it," said Horace. "The fact is, mother, we're neither in the literary nor the clerical department. I'm a printer's devil!"

"Oh, Horace! what do you mean?" said the horrified mother.

"Oh, I'm most innocently employed. I run messages; I fetch and carry for a gentleman called Durfy. He gives me some parliamentary news to carry to one place, and some police news to carry to another place—and, by-the-way, they read very much alike—and when I'm not running backwards or forwards I have to sit on a stool and watch him, and be ready to jump up and wag my tail the moment he whistles. It's a fact, mother! Think of getting eighteen shillings a week for that! It's a fraud!"

Mrs. Cruden could hardly tell whether to laugh or cry.

"My poor boy!" she murmured; then, turning to Reginald, she said, "And what do you do, Reg?"

"Oh, I sweep rooms," said Reg, solemnly; "but they've got such a shocking bad broom there that I can't make it act. If you could give me a new broom-head, mother, and put me up to a dodge or two about working out corners, I might rise in my profession!"

There was a tell-tale quaver in the speaker's voice which made this jaunty speech a very sad one to the mother's ears. It was all she could do to conceal her misery, and when Horace came to the rescue with a racy account of the day's proceedings, told in his liveliest manner, she was glad to turn her head and hide from her boys the trouble in her face.

However, she soon recovered herself, and by the time Horace's story was done she was ready to join her smiles with those which the history had drawn even from Reginald's serious countenance.

"After all," said she, presently, "we must be thankful for what we have. Some one was saying the other day there never was a time when so many young fellows were out of work and thankful to get anything to do. And it's very likely too, Reg, that just now, when they seem rather in confusion at the office, they really haven't time to see about what

their regular work is to be. Wait a little, and they're sure to find out your value."

"They seem to have done that already as far as sweeping is concerned. The manager said I didn't know how to hold a broom. I was quite offended," said Reginald.

"You are a dear brave pair of boys!" said the mother, warmly; "and I am prouder of you in your humble work than if you were kings!"

"Hullo," said Horace, "there's some one coming up our stairs!"

Sure enough there was, and more than one person, as it happened. There was a knock at the door, followed straightway by the entrance of an elderly lady, accompanied by a young lady and a young gentleman, who sailed into the room, much to the amazement and consternation of its occupants.

"Mrs. Cruden, I believe?" said the elderly lady, in her politest tones.

"Yes," replied the owner of that name.

"Let me introduce myself—Mrs. Captain Shuckleford, my son and daughter—neighbours of yours, Mrs. Cruden, and wishing to be friendly. We're sorry to hear of your trouble; very trying it is. My husband, Mrs. Cruden, has gone too."

"Pray take a seat," said Mrs. Cruden. "Reg, will you put chairs?"

Reg obeyed, with a groan.

"These are your boys, are they?" said the visitor, eyeing the youths. "Will you come and shake hands with me, Reggie? What a dear good-looking boy he is, Mrs. Cruden! And how do you do, too, my man?" said she, addressing Horace. "Pretty well? And what do they call you?"

"My name is Horace," said "my man," blushing very decidedly, and retreating precipitately to a far corner of the room.

"Ah, dear me! And my husband's name, Mrs. Cruden, was Oward. I never hear the name without affliction."

This was very awkward, for as the unfortunate widow could not fail to hear her own voice, it was necessary for consistency's sake that she should show some emotion, which she proceeded to do, when her daughter hurriedly interposed in an audible whisper, "Ma, don't make a goose of yourself! Behave yourself, do!"

"So I am be'aving myself, Jemima," replied the outraged parent, "and I don't need lessons from you."

"It's very kind of you to call in," said Mrs. Cruden, feeling it time to say something; "do you live near here?"

"We live next door, at number four," said Miss Jemima; "put that handkerchief away, ma."

"What next, I wonder, if my handkerchief's not my hown, I'd like to know what is? Yes, Mrs. Cruden. We heard you were coming, and we wish to treat you with consideration, knowing your circumstances. It's all one gentlefolk can do to another. Yes, and I hope the boys will be good friends. Sam, talk to the boys."

Sam needed no such maternal encouragement, as it happened, and had already swaggered up to Horace with a familiar air.

"Jolly weather, ain't it?"

"Yes," said Horace, looking round wildly for any avenue of escape, but finding none.

"Pretty hot in your shop, ain't it?" said the lawyer's clerk.

"Yes," again said Horace, with a peculiar tingling sensation in his toes which his visitor little dreamed of.

Horace was not naturally a short-tempered youth, but there was something in the tone of this self-satisfied lawyer's clerk which raised his dander.

"Not much of a berth, is it?" pursued the catechist.

"No," said Horace.

"Not a very chirrupy screw, so I'm told—eh?"

This was rather too much. Either Horace must escape by flight, which would be ignominious, or he must knock his visitor down, which would be rude, or he must grin and bear it. The middle course was what he most inclined to, but failing that he decided on the latter.

So he shook his head and waited patiently for the next question.

"What do you do, eh? dirty work, ain't it?"

"Yes, isn't yours?" said Horace in a tone that rather surprised the limb of the law.

"Mine! No. What makes you ask that?" he inquired.

"Only because I thought I'd like to know," said Horace, artlessly.

Mr. Shuckleford looked perplexed. He didn't understand exactly what Horace meant, and yet, whatever it was, it put him off the thread of his discourse for a time. So he changed the subject.

"I once thought of going into business myself," he said; "but they seemed to think I'd do better at the law. Same time, don't think I've a nailor on business chaps. I know one or two very respectable chaps in business."

"Do you?" replied Horace, with a touch of satire in his voice which was quite lost on the complacent Sam.

"Yes. Why in our club—do you know our club?"

"No," said Horace.

"Oh—I must take you one evening—yes, in our club we've a good many business chaps—well-behaved chaps too."

Horace hardly looked as overwhelmed by this announcement as his visitor expected.

"Would you like to join?"

"No, thank you."

"Eh? you're afraid of being black-balled, I suppose? No fear, I can work it with them. I can walk round any of them, I let you know; they wouldn't do it, specially when they knew I'd a fancy for you, my boy."

If Horace was grateful for this expression of favour, he managed to conceal his feelings wonderfully well. At the same time he had sense enough to see that, vulgar and conceited as Samuel Shuckleford was, he meant to be friendly, and inwardly gave him credit accordingly.

He did his best to be civil, and to listen to all the bumptious talk of his visitor patiently, and Sam rattled away greatly to his own satisfaction, fully believing he was impressing his hearer with a sense of his importance, and cheering his heart by the promise of his favours and protection.

With the unlucky Reginald meanwhile it fared far less comfortably.

"Jemima, my dear," said Mrs. Shuckleford, who in all her domestic confidences to Mrs. Cruden kept a sharp eye out on her family—"Jemima, my dear, I think Reggie would like to show you his album!"

An electric shock could not have

startled and confused our hero more. It was bad enough to hear himself called "Reggie," but that was nothing to the assumption that he was pining to make himself agreeable to Miss Jemima—he to whom any lady except his mother was a cause of trepidation, and to whom a female like Miss Jemima was nothing short of an ogress!

"I've not got an album," he gasped, with an appealing look towards his mother.

But before Mrs. Cruden could interpose to rescue him, the ladylike Miss Jemima, who had already regarded the good-looking shy youth with approval, entered the lists on her own account, and moving her chair a trifle in his direction, said, in a confidential whisper,

"Ma thinks we're not a very sociable couple, that's what it is."

A couple! He and Jemima a couple! Reginald was ready to faint, and looked towards the open window as if he meditated a headlong escape that way. As to any other way of escape, that was impossible, for he was fairly cornered between the enemy and the wall, and unless he were to cut his way through the one or the other he must sit where he was.

"I hope you don't mind talking to me, Mr. Reggie," continued the young lady, when Reginald gave no symptom of having heard the last observation. "We shall have to be friends, you know, now we are neighbours. So you haven't got an album?"

This abrupt question drove poor Reginald still further into the corner. What business was it of hers whether he had got an album or not? What right had she to pester him with questions like that in his own house? In fact, what right had she and her mother and her brother to come there at all? Those were the thoughts that passed through his mind, and as they did so indignation got the better of good manners and everything else.

"Find out," he said.

He could have bitten his tongue off the moment he had spoken. For Reginald was a gentleman, and the sound of these rude words in his own voice startled him into a sense of shame and confusion tenfold worse than any Miss Shuckleford had succeeded in producing.

"I beg your pardon," he gasped, hurriedly. "I—I didn't mean to be rude."

Now was the hour of Miss Jemima's

triumph. She had the unhappy youth at her mercy, and she took full advantage of her power. She forgave him, and made him sit and listen to her and answer her questions for as long as she chose; and if ever he showed signs of mutiny, the slightest hint, such as "You'll be telling me to mind my own business again," was enough to reduce him to instant subjection.

It was a bad quarter of an hour for Reginald, and the climax arrived when presently Mrs. Shuckleford looked towards them and said across the room,

"Now I wonder what you two young people are talking about in that snug corner. Oh, never mind, if it's secrets! Nice it is, Mrs. Cruden, to see young people such good friends so soon. We must be going now, children," she added. "We shall soon see our friends in our own 'ouse, I 'ope."

A tender leave-taking ensued. For a while, as the retreating footsteps of the visitors gradually died away on the stairs, the little family stood motionless, as though the slightest sound might recall them. But when at last the street door slammed below, Reginald flung himself into a chair and groaned.

"Mother, we can't stay here. We must leave to-morrow!"

Horace could not help laughing.

"Why, Reg," he said, "you seemed to be enjoying yourself no end."

"Shut up, Horace, it's nothing to laugh about."

"My dear boy," said Mrs. Cruden, "you think far more about it than you need. After all they seem kindly disposed persons, and I don't think we should be unfriendly."

"That's all very well," said Reg, "if there was no Jemima in the question."

"I should say it's all very well," said Horace, "if there was no Sam in the question; though I dare say he means to be friendly. But didn't you and Jemima hit it, then, Reg? I quite thought you did."

"Didn't I tell you to shut up?" repeated Reg, this time half angrily. "I don't see, mother," he added, "however poor we are, we are called on to associate with a lot like that."

"They have not polished manners, certainly," said Mrs. Cruden; "but I do think they are good-natured, and that's a great thing."

"I should think so," said Horace.

"What do you think? Samuel wants to

propose me for his club, which seems to be a very select affair."

"All I know is," said Reginald, "nothing will induce me to go into their house. It may be rude, but I'm certain I'd be still more rude if I did go."

"Well," said Horace, "I vote we take a walk as it's a fine evening. I feel a trifle warm after it all. What do you say?"

They said yes, and in the empty streets that evening the mother and her two sons walked happy in one another's company, and trying each in his or her own way to gain courage for the days of trial that were to follow.

The brothers had a short consultation that night as they went to bed, *not* on the subject of their next-door neighbours.

"Horrors," said Reg; "what's to be done about the 'Rocket'? I can't stop there."

"It's awful," said Horace; "but what else can we do? If we cut it there's mother left a beggar."

"Couldn't we get into something else?"

"What? Who'd take us? There are thousands of fellows wanting work as it is."

"But surely we're better than most of them. We're gentlemen and well educated."

"So much the worse, it seems," said Horace. "What good is it to us when we're put to sweep rooms and carry messages?"

"Do you mean to say you intend to stick to that sort of thing all your life?" asked Reg.

"Till I can find anything better," said Horace. "After all, old man, it's honest work, and not very fagging, and it's eighteen shillings a week."

"Anyhow, I think we might let Richmond know what a nice berth he's let us in for. Why, his office boy's better off."

"Yes, and if we knew as much about book-keeping and agreement stamps and copying presses as his office boy does we might be as well off. What's the good of knowing how many ships fought at Salamis when we don't even know how many ounces you can send by post for twopence? At least I don't. Good night, old man."

And Horace, really scarcely less miserable at heart than his brother, buried his nose in the Dull Street pillow and tried to go to sleep.

(To be continued.)

THE GOLD FISH.

By REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER IV.

"WELL, Doctor," said Mr. Fields, as the two pedagogues left Chesterton House, "I am naturally anxious to hear the result of your interview."

"Oh, I could get nothing out of the old lady—absolutely nothing. Charity must make allowances for her eccentricities, I suppose; but either you are a deep-dyed villain, Fields, or your accuser has a bee in her bonnet. I suppose you prefer to accept the latter alternative?"

"Well, I certainly don't like the notion of the former. But it would be satisfactory to clear up the matter. Suppose we examine Aston?"

"Ah, we might possibly get something definite out of him. Bring him to my study after school."

The masters now set themselves to make up for lost time, trudging briskly through the fragrant meadows and shady lanes.

Afternoon school passed away, and Edwin Aston was invited by Mr. Fields to accompany him on a visit to the head master's study. Such an invitation was not altogether agreeable, but it admitted no refusal. Edwin was alarmed indeed, and as he stood in that august presence-chamber he fidgeted nervously, and looked at the carpet and then from one to the other of his preceptors, wondering what particular scrape could necessitate

such an interview. His apprehensions were, however, partially allayed by the kind and cheerful way in which his examination proceeded.

"Look here, my boy," began the Doctor, laying his massive hand affectionately upon Aston's shoulder, and feeling his way confidently into the boy's heart by a peculiar pressure. "I received a letter from your aunt this morning, in which

as Mr. Fields cheating? Don't be afraid to speak out. I don't want to frighten you. Come, say something, my boy."

"No, sir, I don't remember saying anything."

"What did you talk about with your aunt at tea last evening?"

"I don't remember, sir."

"Oh, you must try to remember.

least, I think I said something, sir, about the fables—but I don't remember what it was."

"Did you mention Mr. Fields' name at all? Were you thinking about him?"

"I don't think I was, sir. I may have been, but I don't think it's likely. I don't often think much about him."

"Oh," said the Doctor, "I'm sorry to hear that. But could you possibly have

"Oh, you must try to remember."

she says something about Mr. Fields encouraging dishonesty among the boys. Can you tell me anything about it? Try and think now."

Edwin stood open-mouthed, and tried to think—at all times a difficult matter to a boy. But no words gave substance to his thoughts. He was dumb with astonishment.

"Have you been saying anything," continued the Doctor, "which could make your aunt imagine such a thing

Didn't you say something about your work—history, or Latin and Greek?"

"Yes, sir, I remember now. I asked her to lend me a volume of Alison's 'History of Europe' to read about Napoleon in Russia."

"Very good. Well, what then?"

"She said I might take it from the library."

"Well, all right; and what about the Latin and Greek?"

"I don't think I said anything, sir—at

said anything about his acting unfairly or allowing you to work dishonestly?"

"No, sir; I'm perfectly certain I never said such a thing, sir. Of course I couldn't."

"No, my boy, I never for a moment supposed you could. But have you no idea what your aunt means? Look here, read what she says."

Edwin read. His fears had all fled, and he was able to understand what was written.

"I don't know what she means at all, sir. I don't think it's fair of her to write like that. I'm sure Mr. Fields is a jolly—I mean—I shouldn't have thought my aunt could have been such a sn—could have written such a letter, sir."

"I understand you, boy. And you can't tell me anything more about it? You're quite sure?"

"Quite certain, sir. I don't know what she means at all."

"Well, that will do; you may go. Good evening."

Edwin went off as fast as he could; relieved at escaping unscathed from such a perilous interview. He hurried home, determined to ask his aunt what she meant by writing such a letter to the Doctor.

He threw down his books with a bang and bounced into the dining-room, where he was surprised to find his aunt already seated at the tea-table.

She bade him go quietly upstairs and make himself tidy.

When he returned she said, "Edwin, you are later than usual this evening."

"Yes, aunt; I had a jaw from the Doctor."

"A what? Edwin, I don't understand you."

"A jaw, aunt!"

"What do you mean by a 'jaw,' Edwin?"

"Oh, I don't know; there's no other word for it. He had me into his study and blew me up about your writing to him that Mr. Fields cheated."

Edwin spoke with a flush on his cheek and a flash in his eye, betokening proud indignation.

"After our conversation last evening, Edwin, I could not do otherwise than acquaint Dr. Porchester with what you said."

"What I said, aunt? I never said anything; I'm sure I didn't!"

"Stop, Edwin! Never be hasty in your statements. Let me recall to your memory what seems to have escaped it. You were talking about your classical fables, and you distinctly spoke of Mr. Fields acknowledging that the boys cribbed and cheated."

"What a horrid cram, aunt!—I mean, I'm certain I never said such a thing!"

"Edwin, I am astonished at you! I cannot express the pain your words and behaviour cause me."

Poor Edwin! he could not analyse the conflicting emotions which filled his heart, but his pride was sorely wounded.

He blushed and stammered, and a rush of tears burst from his eyes as he choked out in broken syllables, "It's a horrid shame, aunt! I remember now using the words 'crib' and 'cheat,' but I know I never said we cheated. I couldn't believe you were such a sneak!"

The aunt was moved at the sight of her nephew's evident distress: she had never seen him cry before. She might have added further fuel to his disquietude by rebuking his unseemly language, but she thought it discreet to refrain; and, laying her hand gently on his arm, she only said, "Edwin, you must calm yourself. Let us say no more upon the subject now. Finish your tea, my dear."

Tea was diluted by tears, and ended uncomfortably for both without further conversation.

In the early hours of the following morning, when Miss Davis awoke from

sleep, she employed the time in meditating how best to solve the mystery of the carp's disappearance. The conclusion to which she arrived was that, since Edwin had not chosen to volunteer any information upon the subject, duty demanded that she should not let the day pass without questioning him upon it. Whenever duty's demands were plain Miss Davis never hesitated to obey them. And the more unpleasant the operation, the sooner was she anxious to get it over. Therefore she would ask him at breakfast.

That meal had not proceeded far before Miss Davis opened the attack.

"Edwin, I noticed with surprise last evening that the gold fish was not in the pond. Is it possible that you could have disobeyed my orders and caught it? Stay, do not reply till I have finished. However terrible may be the consequences of telling the truth"—("Would the old lady give me a whacking?" thought Edwin)—"I feel certain that you cannot tell me a falsehood."

Edwin grew very red and uncomfortable, and answered, "I didn't catch it, aunt, because you told me not to."

"I am very glad indeed to hear that," said his aunt. "Did your friend Harry Dawson catch it?"

"I'm not a sneak, aunt; but I'm sure he didn't." Edwin mentally added, "He was such an ass he couldn't hold the slippery thing!"

"Well, it is an extraordinary matter. I must ask the gardener. Do you think, Edwin, it could have been the boy who comes in to weed the garden? Did you see him anywhere near the fountain while I was out?"

"I told you I am not a sneak, aunt; but I didn't see him anywhere about all the afternoon."

The following Saturday would be Edwin's birthday. He had been long looking forward to the occasion with glad anticipations. His aunt always made the anniversary as happy for him as she could. She let him invite any of his friends at Highfield to spend the afternoon, and she meant this time to invite some youthful members of the fair sex to meet them.

The privilege of asking his friends was much valued by Edwin. It was a potent engine with which he wrought for himself no small advantage in social politics. Boys at preparatory schools (for whom these Highfield stories are specially intended) enjoy being asked out for an "exeat" beyond everything. Afterwards when they pass on to a public school and become "men" by one gigantic leap, and develop perhaps into "mashers," they are apt to take a different view of such pleasures. It is wonderful how the climate of some public schools assists this sudden development of manhood. Like as tadpoles suddenly find themselves frogs, so do boys suddenly find themselves men. Little Tommy Tucker leaves his preparatory school at the end of a term, and enters his public school after the holidays, and has not been there a week before he writes to his bosom friend Hop-o-my-thumb: "I like Winchester awfully. We have jolly fun. Last remedy I and another man went a long walk, and had no end of grub."

Edwin was very particular about the boys whom he should favour with a birthday invitation. You may be sure

that every one who thought he had a ghost of a chance did his utmost to secure the treat. For weeks beforehand Edwin was courted with marked deference by many a companion who at other times gave no special heed to make himself agreeable. The great Dumpling, for example, would come up to him patronisingly in the playground, and lay his great fat hand round Edwin's neck, and smear and crumple his clean Eton collar with greasy dirty fingers, and say,

"Aston, you're a jolly fellow. I like you awfully. Come on. I'll give you a cake from Punchey's basket."

Buffles and Guzzling Jim too would "suck up" to him with cringing pertinacity. By varied methods, equally obvious in their intention, many a companion competed vigorously for the longed-for favour.

But Edwin received their overtures with scornful contempt, and set his face like a heathen idol against all such undisguised demonstrations of cupboard love. His genuine friends, of course, made no difference in their behaviour, and reposed secure in the assurance of an invitation. The list of favoured guests was known beforehand only to the happy initiated. And this time three boys were basking in the delightful prospect of the next Saturday afternoon. These were Harry Dawson, Dickey Stephenson—his brother had left or he too would certainly have been asked—and who was the third? None other than our old friend Hercules!

Yes, Hercules, the hero of that escapade with the donkey Cacus which has rendered Highfield House School famous all the world over. It is no presumption to assert that the fame of that celebrated episode has spread in all the four quarters of the globe! The Boy's Own Paper is not read in a corner! It is nothing for the author to be proud of. Virgil draws such a picture of FAME as should make few persons anxious to have much to do with her.

He describes her as a monster hideous and huge, swift-footed, many-tongued, all-seeing, growing as she runs, rearing her gigantic form from earth to heaven, terrifying cities, shrieking in the darkness, never closing her eyes in sleep! Ugh! we should not like to have much to do with her, boys!

The wished-for day at last arrived, and a glorious summer day it was, without a cloud upon the sunny skies. But such an occasion deserves another chapter.

(To be continued.)

THE TEMPTATION OF TO-DAY.

Canon Liddon writes:—There is no temptation to be ashamed of Christ when all the world around is at any rate professing Him; but the temptation was formidable when His Church was young. Wonderful it is how, in those first ages of the faith, men and women, boys and girls, joyfully accepted a painful death rather than be disloyal to their Saviour. It was otherwise when the Church had conquered society; then, during long ages, however much Christians might differ from one another, none would have been ashamed to own the name of Christ. This, however, can now be no longer said; throughout Christendom there is a section who reject the name of Christ, not only in practice, but professedly, and this change clearly imposes upon us the duty of confessing Christ before men more explicitly than when none openly rejected Him. Ashamed of Jesus Christ! What a perversion of the emotion of shame!

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

*Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,**Author of "Harold, the Boy Earl," etc.*

CHAPTER XVII.—(continued.)

New persons could imagine the rage of Abrazoff.

"What!" he cried, "does anybody dare to cast such a slur on my name as to suppose me guilty of conduct requiring police investigation? If any such person exists I hurl the imputation back in his teeth. I brand each and every such accuser as a liar, unworthy of the notice of a gentleman, and if he be of noble rank I demand the satisfaction which one gentleman demands of another."

"Mr. Abrazoff," exclaimed Count Schaafstadt, "we are assembled here to-night in peace. We have invited you as a member of the circle of the nobility of Moscow to ask you whether you will satisfy us on certain grave points of conduct imputed to you. If you decline to have the matter looked into by us the law shall take its course and your arrest shall follow—to our extreme regret, because we, being Russian nobles, are unwilling to have the disgrace cast on our order which this conduct implies. With your permission, Mr. Brandt, in whose hands the legal points have been entrusted, will explain the circumstances under which we have invited you to this house to-day."

Livid with rage, Abrazoff snarled,

"Let the fellow read the farrago you have concocted."

Without noticing the insult, the count begged Brandt to read, which he did to the following effect:

"Alexander Sergevitch Abrazoff had two sons, Ivan and Nicolai. Ivan was ten years older than Nicolai, and was heir to a large property left solely to him by his grandfather, subject to certain conditions to be decided upon by the father. Serge married a young lady without fortune whom he met at a ball at St. Petersburg."

"It is false!" shouted Abrazoff; "she was a mere peasant. Of that I have proofs."

"Let me beg you," said Kakaroff, "not to abuse our kindness in laying the whole of the case before you for your guidance; and with regard to the birth of the lady in question, I may inform you that she was first cousin to my wife."

"A conspiracy!" hissed Abrazoff between his teeth.

"Will you allow Mr. Brandt to continue, or do you prefer arrest at once?" inquired Kakaroff.

Abrazoff flung himself back in the chair, and Brandt went on.

"When the father heard from the younger son that Ivan had married without consulting him he formally disinherited the elder and settled every acre of land and every kopek of money on the younger."

"So far that's true," growled Abrazoff.

"The elder son, as a chivalric young fellow, had chosen the military profession, and had joined the Prebojenski regiment of Guards, and was the chosen

friend and companion of the famous Skobeleff. Now the 'White General,' as Skobeleff was called, was greatly interested in the private affairs of his officers, and was touched by the tale which he heard from Abrazoff of the manner in which he had been supplanted in his father's love by the younger brother, and taking advantage of a chance meeting with the old gentleman, completely satisfied him as to the perfect respectability of his son's wife, who in her noble devotion had prepared to follow her husband to the field. The father executed a legal revocation of the first will, and signed a new one, which was witnessed by Skobeleff himself."

"It is false—all false!" now fairly shrieked Abrazoff.

"Unfortunately for that statement," said Brandt, "we have the document."

"Will you oblige me by letting me see it?"

"Certainly, if you wish it."

Brandt here unlocked the portfolio and drew out a document, which he began to read, giving all the legal absurdities of phraseology their full swing with extreme relish. Abrazoff listened until Brandt read the words, "Therefore, and upon these and other such-like cogent and fitting grounds, I hereby utterly revoke, recall, and annul my previous will and testament in favour of my younger son Nicolai, and reinstate my eldest son Ivan in all the rights, privileges, and possessions named in my said will hereby revoked, cancelled, and annulled, such possessions being—"

"The whole thing is a forgery! All the letters of my father, all the documents except the will which conferred the estate on me—all other documents perished in the flames when my house at Berozovo was burnt!"

"I beg your pardon," said Tenterton; "I had the good fortune to save all those documents from the fire!"

"You—you contemptible serf! How could you know anything about those papers, when I had hunted for them for years and could not find them?"

"They were," said Tenterton, "in the writing-table in my room, and I took them with me by mistake amongst my own."

"Holy saints!" cried Abrazoff, now thoroughly taken off his guard; "how could we have overlooked that? And so the house was burnt—that is to say, the accident of the fire brought me no security!"

Brandt looked at Tenterton, who, answering the look with a glance, said, "Yes, I see you are right now, but I should not have thought it possible."

Here Abrazoff lost all control, became fearfully excited, and before he could be prevented flung himself like a wild beast on Brandt. There was a sharp struggle, and the document was wrenched from the lawyer's hand and torn into a thousand fragments!

"Now," he roared, "you may remember

that two can play a dangerous game like this!"

Brandt picked himself up from the floor, and, although in as great a rage as Abrazoff, contrived to calm himself, and, addressing Kakaroff, said, "I appeal to your Excellency for protection in the exercise of my functions as legal adviser to the heir of the estates unlawfully held by Nicolai Abrazoff, whom I denounce in your presence as guilty of perjury, arson, and other crimes. With regard to the destruction of the document just now, I need only say that, as it was but a copy, no harm is done. The original papers are in my strong-box, quite out of the reach of the criminal whom I, in the presence of these gentlemen, formally denounce."

Kakaroff turned to Tenterton, who had been an amazed spectator of the scene, and requested him to touch the electric bell, asking at the same time Smirnoff's permission to have it done.

"Certainly, only I can ring myself," said Smirnoff.

He accordingly rose from the sofa and rang.

On the approach of the servant, Kakaroff said, "Will you oblige me by allowing this man to go down to the street door and tell the police-sergeant whom he will find there to whistle and bring in aid? Tell him to whistle twice shrilly and once faintly; aid will arrive at once."

A look from Smirnoff was sufficient. The signal whistle was heard repeated as Kakaroff had desired, and in an incredibly short time the heavy tramp of armed men was heard on the staircase.

"Mr. Brandt, will you kindly reduce to writing a report of this meeting so far, with the admissions of the prisoner that he had sought for the documents all over his house at Berozovo with a view to their destruction; that to ensure that end he set fire to his own house at Berozovo; that, under the impression that the paper read by Mr. Brandt, the advocate, was the original will in favour of his elder brother and that brother's child, he committed a savage assault upon the person of Mr. Brandt, the aforesaid advocate, this assault being committed in the house of Mr. Smirnoff, in the presence of the Count Schaafstadt, of General Kakaroff, Mr. Smirnoff aforesaid, and of Edward Tenterton, all and each of whom heard the admissions and confessions aforesaid? It has become incumbent upon the said Smirnoff to denounce the said Abrazoff to the nearest officer of police in his district as a dangerous person, likely to bring discord into the city of Moscow, and to cause trouble amongst the peaceful inhabitants thereof. Further, that the said Abrazoff, by suppressing the fact of the existence in this life of his nephew, Ivan Abrazoff, commonly called Ivan Dobroff, has deprived the said Ivan of his rights, privileges, and possessions arising, accruing, and situate in the government of Riazan. In consequence of these and other such

evil deeds and practices the said Nicolai Abrazoff is hereby denounced as a malefactor and a felon."

When this remarkable production was ready for signature, all those who were present signed it in the order in which they were mentioned, the armed men were admitted, and the prisoner was carried off to the tschast.

As soon as he had been removed the gentlemen who had met on this most important question drew round the table to read the copies of the other documents which Mr. Brandt had provided. There was convincing proof that Abrazoff had placed his nephew with a peasant woman at Berozovo, that the priest of Ozoonovo had given the boy to Smirnof, calling him Ivan Dobroff, that this Ivan Dobroff was therefore heir to the estates of the Abrazoff family in the Riazan government, subject to charges for the maintenance of the family of the uncle. The proof of the identity of the boy called Ivan Dobroff was very perfect. It seemed that General Zakoffsky had declared to Kakaroff that he had known Madame Abrazoff, who died during the Turkish war; that he had observed the rage and confusion of Nicolai Abrazoff at hearing of the death of Olga Ivanovna, and of the loss of the boy entrusted to her charge.

Here Tenterton interrupted the account of the various charges against Abrazoff by stating that he was in the carriage at the time of the announcement of the death of the old peasant woman, and was perfectly astounded at the rage into which this news had thrown Abrazoff. Tenterton's evidence was also added to the rest, and was thought important as a corroboration. A striking link in this chain of evidence was the resemblance observed by the boys at the railway station between Ivan in his girl's dress and Abrazoff's sister, which was more than an ordinary family likeness.

At this point Smirnof spoke.

"Gentlemen," he said, "I am deeply sensible of your extreme kindness to my adopted child, to whom, as it seems, wealth is about to flow in such profusion as to render the inheritance with which I have endowed him quite superfluous. But where is he? By some extraordinary fate he is taken from me again just as I was beginning to realise the fact of his return. The house was a happy one for a few days only. Mr. Tenterton knows that I had only just completed an arrangement with him for the more careful training of Ivan, when the boy was mysteriously taken from me, and that on the very day on which Mr. Tenterton came to see him for the first time, a week ago. What can have become of him? I trust, General Kakaroff, that you will now permit me to offer a reward. You see my offer last time produced the boy. I must say that I am quite indifferent to the amount of money that I have to pay so long as I only have him back, the more so as at present any sum that I may pay will not affect his future, seeing that he is provided for so amply by his grandfather's will, and the rewards I now offer will not reduce his capital to any very great extent. I am most wretched about the boy, and I shall be only too glad when General Kakaroff sees his way to the publication of the rewards."

"What do you think of offering?"

"Just as much as I offered before; or more if required."

"You must be uncommonly fond of the boy!"

"I am, and you cannot give me a greater pleasure than to find him for me, and to allow the reward to be given to the actual agents in his discovery."

"To-day is Monday. Will you let the matter remain until Wednesday? I have a series of inspections to make all through the north-east districts of Moscow tomorrow, and I shall put the matter before all the officers of the tschast, place the reward before them, and see what the result may be. I should prefer this to a public reward, which would only open the door to his being stolen again as a fruitful source of income to the thieves."

"But that was not the case on the last occasion. He was found by the police, not by the criminals whom you suspect of taking him."

"That is quite true, but I am not at all sure that the large reward which you then offered may not have influenced this second attempt. Certainly the student Palitzki did not steal him for gain, nor did Anniesie conceal him with a view to the reward; but hosts of thieves heard of the amount you offered, and you may depend upon it they resolved to have him if another chance should offer. I think it was unwise, and should strongly advise you to do nothing until you hear from me on Wednesday afternoon or Thursday morning."

"As you like. Of course, you are Prefect of Moscow, and your will is law, but I feel wretchedly uneasy about my boy!"

"That you can be as much as you like, so long as you keep the uneasiness to yourself and don't talk about rewards until the boy is brought home; then give what you like privately, but don't invite the vagabonds of Moscow to empty your pockets through the goodness of your heart."

Smirnof yielded to this view of the case, although, like many who believe in money, he believed it to be omnipotent.

The next point of importance to be discussed was the mode of action to be adopted with Abrazoff. Smirnof suggested that as they had been two hours and a half at work, they should first refresh exhausted nature. Accordingly the whole party adjourned to an adjoining room, or rather hall, where a sumptuous cold collation had been prepared under the name of "tea," which was justified by the magnificent silver tea-service and gorgeous samovar of the same metal that stood upon the table.

At Smirnof's table there was some special delicacy in the flavour of the tea, which had been imported for him by the celebrated Popoffs of Moscow, and the price he paid would have certainly been something utterly beyond the comprehension of English housekeepers, who would never dream of paying fifty shillings per pound for tea!

After tea the whole party retired to the "cabinet," or study as we should call it.

They were not very long about the deliberation, for they had already taken the initiative by drawing up the "denunciation" of Abrazoff, and it was now resolved to follow this up by a regular lawsuit to be conducted by Brandt, who had shown such skill in getting the evidence together.

Said Count Schaafstadt, "You were remarkably clever about that original document and the copy. I was very

much scared when I saw it torn. Where are the originals?"

"Safe in my strong box, but any of you can see them at any time, and if General Kakaroff thinks it safer I will deposit them with the case as I draw it up in the hands of the Crown prosecutor, to be produced at the trial."

"No necessity for that," said Kakaroff. "I am only too glad that the matter is in your hands, and am thankful to Tenterton for having made me acquainted with such a lawyer. I am only too happy to think that the success of this cause, which I believe to be certain, will at once bring you before the public at the head of the legal profession. I speak for myself and my friend Count Schaafstadt when I say that the nobility of Moscow will be personally grateful to you for any steps you may take to keep the order from being contaminated in the public mind by the evil deeds of one individual."

Before any reply could be made a servant appeared announcing the arrival of a police corporal with a note for Kakaroff. He was at once admitted, and the prefect opened and read the note, which he handed over to Brandt. Its contents were as follows:

"I am inclined to make terms rather than expose myself and family to a public trial. The evidence is too strong, and I shall be ready to yield up possession to my nephew, of whose existence I was not aware, on being satisfied of his identity. My terms are immediate release and sufficient provision for myself and family.

(Signed) "N. ABRAZOFF."

"It is too late now," observed the count. "The thing will be all over Moscow to-morrow, and if we withdraw it will be seen to be a matter of favour and arrangement."

"It need not be 'all over Moscow' unless you like. My men don't talk, and I have only to suppress it," said Kakaroff. "No person need be a bit the wiser."

"How about the written denunciation," said Smirnof, "to which we have all affixed our signatures?"

"That has to come before me before it has any force, and then I can suppress it," said the prefect.

"But you have already signed it," observed Brandt; "will it come before you again?"

"Yes, for the stamp and official signature as prefect. Of course, I could stop it, but I am afraid from what I have seen of Abrazoff to-day that if we compromise the matter he will do something very desperate to Ivan; and should he make away with the boy by some means which would keep suspicion from himself, why, all the property would revert to him and his family, and we should have been working for him."

"What singular people you are!" said Tenterton. "In England there would be no possibility of concealing such dreadful things. There the majesty of the law asserts itself!"

This was received with great applause and much laughter, his auditors believing, evidently, that the practices in England were every bit as bad as those in Russia, only not so much talked about.

Kakaroff wrote upon his visiting card the following words: "Received your application. It is too late to suppress the case, instructions having been

issued." He enclosed this in an envelope from Smirnoff's writing-table, sealed it with black wax (the court was in mourn-

ing), and, pressing his signet-ring on the wax, completed the missive, which he then sent off by the soldier. Tenterton

and Brandt now left, and the official business was over.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grhame," etc.

CHAPTER IV.—LIFE IN A TRAINING-SHIP.

To say that Colin was unhappy all that day would convey but little notion of the state of his feelings. Under arrest! He had plenty of time to think—he was wretchedly miserable, and, naturally enough, he conjured up the very worst that could possibly happen.

He moved about, when he did move at all, like one in a dream. All the noise and bustle of duty going on around him seemed far away. It did not concern him—so he felt. These happy cadets had probably never disgraced themselves as he had done. How little he knew!

The men too looked so jolly and careless, he would gladly have changed places with any of them. Under arrest! Disgraced and dishonoured already, and hardly a day in uniform! He would be tried by court-martial or by "court of inquiry," and turned out of the service! And his dear mother: Oh! it would break her heart. And his uncle—well, there was some little consolation in thinking that it was on his account he had fought.

He could neither eat nor rest. At times he stood gazing out of the port. He had half a mind to jump in and swim on shore—it was not so very far. But then that would be desertion, and not only desertion but downright cowardice. No, he would stay and brave it all. It would make matters worse to run.

He wished so much to have some one to talk with, but all were busy, and the cadet who had proved his friend the day before, and whose name was Quentin Steele, had gone on twenty-four leave.

The day wore away at length, and night fell; he was glad when he found himself in his hammock with all quiet around him, only the steady tread of the sentry heard overhead, or the noise of laughing voices in the distant wardroom. The night before he had fallen asleep with the semi-musical shout of "All's well" from the upper-deck sentries ringing in his ear. The sound was new to him, it breathed romance; it was a sound that he would hear every night of his life for years to come, a sound that was part and parcel of the career that was before him. To-night he heard it, and turned in his hammock and sighed. Gradually all sounds save and alone the sentry's tread died away, but Colin still lay awake, and every time the bells were struck he started as if they rung the funeral knells of his departed ambition.

He did manage to fall asleep at last, and his dreams were weary toilsome ones. No wonder that he awoke unrefreshed in the morning.

His friend Quentin Steele was still absent, so Colin had few he cared to speak to. His brother cadets chaffed Burgess and chaffed Colin through Bur-

"You'll be hanged this time, Burgess," said one.

"And your co-belligerent will be hung up by the toes."

"Doesn't Sawney look white?"

"White, did you say, he looks precious black about the eyes, anyhow."

"He'll look blue enough before long."

"Scotchmen are all green."

Colin took no notice. Twelve o'clock came round at last, and both delinquents were brought up before the commander, "planked," as it is called.

"Keep your pecker up, old man," said a voice close to Colin's ear as he was going on deck. Colin looked round; it was Steele. He had just come on board.

The commander—gold lace half up to the elbows—looked very stern. Colin was not sure though whether he was gazing at him or at Burgess, for, truth to tell, he squinted.

"Oh! Ah!" he grunted, as he heard the complaint, "fighting, eh? I know you, Mr. Burgess, but who is this young gentleman? A fresh face."

"Only came the day before yesterday, sir," said the quartermaster.

"Ha! ha!" laughed the commander, and it was a laugh that boded no good.

"Only joined the day before yesterday. Pretty beginning, pretty mess you've made of it. Both equally guilty, I suppose?"

The prisoners did not speak.

"Well, we'll make short work of it."

Poor Colin's heart felt like lead at these words.

"One moment, if you please, sir," said Quentin Steele, coming boldly up in front of the commander and saluting him.

The commander looked at him over a book of some mysterious kind which he held in his hand—but did not speak.

Quentin told the whole story of Colin's arrival with his one-legged uncle, as the reader already knows it, and the scene next morning, Colin's forbearance, great provocation, and so forth.

"That's enough," said the commander. "Mr. McLeod you may go. Don't take the law in your own hands again. Mr. Steele, I'm obliged to you for enabling me to put the saddle on the right horse."

The right horse *was* saddled, and so effectually that he did not leave the ship for a fortnight.

From that very hour Quentin Steele and Colin McLeod were fast friends.

It was not long now ere Colin settled thoroughly down in his new and certainly novel situation. He made many friends, perhaps even a few foes, for Colin was imperturbable. His first experience served him in good part. He was wise. He had learned a lesson, and a bitter one it was, so he determined to profit by it. He tried never to lose his temper, and

when chaffed about either his accent or the land of his birth he took it in good part, and if he possibly could he laughed it off; if he really felt angry he kept silent.

So his messmates soon came to know his peculiarity.

"Look out," some one would cry, "McLeod's in a wrath."

"He's too quiet by one-half," another would add.

"It's the lull before the storm."

"Look out, boys, the Assyrian'll be down presently like a wolf on the fold."

But Colin did not keep his anger long. He was soon pleasant and happy again and singing.

Even Bully Burgess made friends with him at last. This lad was always up to mischief and practical joking. He even endeavoured to get Colin to join him in some of his mad pranks, but in vain.

"Now, I say," continued Bully one day, "those fellows Smith, O'Brien, Marvell, Rae, and that lot, are constantly chaffing you about your country. Why don't you hit 'em? That's what I'd do if I had an arm like you; I'd have them out down here into the orlop-deck, one by one—take a day to each, you know, and some days you might polish two off. Think of it. Take my advice. I would simply say after lunch some day. Capital day Friday—work of the week about through, and if you half kill a fellow our old Sawbones will put him on the list till Monday. Do you catch?"

"Yes," replied Colin, "I catch, as you call it, but I won't hold. No, Burgess, the bait isn't tempting enough."

"Well, you're a dough-eater."

"Thank you, I prefer to continue on the same loathsome tack, Burgess; better be a dough-eater than a fire-eater."

"Very well," cried Bully, jumping up; "good-bye."

"The world is half made up of fools like you,
So—live in peace—adieu!"

Poor Bully Burgess, he was never long out of mischief, nor long out of hot water. And as for idleness—well, he used to say to himself that it was his strong point.

"You've heard," he said to Colin once, "or," he added, sarcastically, "your reading has doubtless carried you as far as the story of the truant schoolboy who went on a fine day to a dog and then to a bird and then to a bee and so on, asking them time about to come and play with him?"

"I know, I know;" cried Colin, impatiently; "and they each and all refused. They had something else to do, and at last the boy went to school and settled down to his work like a man."

"Ah, yes," said Bully, "but only the first part of the fable suits my book. Mind that, and if I can't get anybody to

play with me, why, I'll play alone." Bully Burgess did play alone, and to some purpose, as will presently be seen.

Colin McLeod liked his new life very well indeed after a time. The ship he was in was an immensely great craft in our hero's eyes at all events. She was partly school and partly man-o'-war. The lessons were not very hard, and there were about half a dozen naval instructors, to say nothing of French and drawing masters.

The life led was extremely regular ;

day when I'm not in. And when I *do* come in you are not to take that as a hint to fly away. Whenever I want you to leave I'll tell you straight. Only don't speak unless you're spoken to, and don't expect me to help you with your lessons ; at all events don't ask me, because I won't. I'm paid for doing my duty, and I do it. I'm not paid for doing anything extra, and I don't."

It was such a prettily furnished cabin this of Mr. Baker's. Not very large. There was the cot, covered with rich,

now ships and shipping only, now the far-off hills, and anon the sea itself. This latter Colin never tired looking at. It was never, never the same, but whether tossed and foam-flecked with roaring winds or calmly sleeping under a blue and windless sky, Colin felt he loved it. Was it not his future home ?

Yes, it would be his future home if he worked now, worked and worked and worked and never tired.

The rocking-chair was very luxurious. One lovely afternoon—it was a Saturday

"Douglas threw his work of reference across the table."

even games and amusements were conducted with method. The strictness of the service routine was for a time rather irksome to Colin, newly from the wild, free hills as he was, but he soon came to like even that. For when duty *was* over, when work *was* done, then he could play with an easy mind and a clear conscience.

There was a naval instructor of the name of Baker, a man of some standing in the service, who, seeing how earnest Colin was in the pursuit of his studies, took a great interest in him.

"Come along," he said one day, "into my cabin. Bring your books ; you'll be quieter here.

"Now let us understand each other thoroughly. You can come in here every

soft rugs, two tiny cushioned chairs, and a neat rocking-chair upholstered [ugly word that, "upholstered"] in blue satin, a fairy chest of fairy drawers, a fairy washhandstand, a fairy bookcase with the best authors in the smallest possible compass, and fairy pictures—chiefly of ships and scenery—all round the bulkheads, with brackets in the corners with flowers. Then there were curtains and hangings wherever they seemed in place, so the whole cabin had an air of quiet refinement that was not only refreshing, but calmly impressive.

The great port windows were nearly always open, and the view that Colin saw therefrom was for ever changing as the ship swung with tide or wind. Now it would be the romantic old town itself,

—Colin gave way to temptation ; he took his Euclid and sat down in the rocking-chair.

It was very pleasant. Colin tried to study. "Let ABC be a given triangle, the angle CAB a right angle, then the angles ACB and CBA are together—"

Colin never got any further, for the simple reason that he had fallen asleep. That rocking-chair was far too pleasant.

By-and-by Baker came in. He smiled to himself and said nothing, but when Colin at length awoke his Euclid was gone, and in its place on his lap lay a Bible, with a pin stuck through this verse—Proverbs vi. 9.

Colin never ventured to sit again in that rocking-chair.

"Look here," said Bully Burgess one morning, "I'm going to have some rare fun to-night. I'm going to give a quiet spread, and we'll have it out about the Scotch and English battles. I'm so sorry you are going on shore to-night and can't come."

Now, Bully really possessed talent, though he put it to a bad use, as may be seen from the following brief account of the last of his doings on board the cadet-ship.

All he invited came willingly enough to Bully's spread. He had managed to get together quite enough of the "good things," as he called them, of this life to make a decent show, and everybody said Bully wasn't a bad fellow at heart, though he often had somewhat queer ways with him.

Now Bully had managed to get to his party a fair sprinkling of Scotch cadets, and these he also managed to seat all at one side of the board. I am not going to say what were the viands Bully placed before his guests; some of them were contraband and of a rather exciting nature. It was not difficult to lead the conversation back to the old days of history, when England and Scotland were at deadly enmity. Then, some argument arising about the amount of slain at a certain battle, Bully quietly produced a couple of books of reference, putting one at each side of the table. They were old books, one written by a Scotch author, another by an English. It is needless to say that both gave a bigoted account of the battle. And it is almost needless to say that, their patriotism fired by Bully's contraband viands, argument soon raged high. Sad to say, words soon came to blows. A Scotch boy was kicked from under the table, apparently from the other side, but I doubt that Bully knew something about it. Then the boy who had been kicked and whose name was Douglas threw his work

of reference across the table, crying in a mock heroic tone,

"On as thou wert wont, brave heart,
Douglas shall follow thee."

Douglas did follow, and the row that arose defies description; but there are one or two wearing epaulets now in the service who remember it well.

This was the result. Three days after the battle Bully Burgess's father came down for him, and Bully went away from the ship *in plain clothes*. No one pitied Bully, but I'm sure that many were sorry for the tall aristocratic soldier his father; he looked very sad, and felt his son's disgrace.

Many a time in after life did Colin McLeod look back with pleasure on the happy and uneventful days he spent in that dear old training-ship. I believe when he left he had none but friends on board.

He passed with flying colours. His uncle was delighted. His mother was so glad to have him home for what she in her innocence imagined would be a long "spell" of leave—much longer than any of the previous vacations.

True to his word, Duncan Robb had joined the marines. Colin's brother did the best he could for him; he, too, was glad to have his brother back, and planned all sorts of fishing excursions for him, to say nothing of the pleasant days they were to spend together on the moors.

But in less than a fortnight Colin was ordered off.

"It is the exigencies of the service, my dear," Captain Peter explained to his sister. "Colin no longer belongs to us, but to his country."

Colin's mother was very sad, but somewhat proud withal to think that his country apparently could not get on at all without her boy Colin.

The truth is that Captain Peter himself was at the bottom of Colin's hurried

departure. He had a friend or two at Court, and when one of these, who was down in Scotland shooting, offered to get his nephew appointed to a flagship,—

"Flagship!" cried the old captain—"flagship! Fiddlesticks! I want my boy to be a sailor. Send him down the coast a year; let him rough it. If he behaves himself, then we'll get a good ship for him, but no flagships—no feather-bed business. I roughed it; let Colin do the same!"

So off down the coast (of Africa) went Colin in a gunboat. He did rough it, and when he returned to his father's glen, just one year after, with six weeks' leave to do as he pleased, he was as brown as a huckleberry, and as tough and hard as hickory.

Then he set himself to enjoy his leave, and I am bound to say he did. Well, he had earned it.

But one forenoon Uncle Peter was heard coming along the hall towards the drawing-room, where Colin was quietly reading to his mother, and the old man was making such a clattering noise with his wooden leg that it was quite evident to everybody that something more than common was in the wind.

"Here you are!" he cried, bursting into the room and waving a long white official envelope over his head—"here you are! What a lucky young dog to be sure! Appointed to the *Theodora*! Think o' that! And you're only a baby! You're off on special service too! You'll go everywhere and see everything! Lucky young dog, you! lucky young dog!"

Colin's mother turned somewhat pale, and laid down her work. Colin went and kissed her.

"Bid me joy, mother," he said. "It will be a long cruise—a whole commission—but I mean to come back with my epaulets on!"

(To be continued.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

III.—FISHING WITH THE ARTIFICIAL FLY—FLIES AND TACKLE.

THE flies which the fly-fisher must needs imitate with fur and feather if he would catch trout are in England comprised by the entomologist under several specific names. The Ephemeridæ, Phryganidæ, Perlidæ, and Muscidæ include most of these, and indeed, on clear streams, may be said to form the chief of the food of the trout inhabiting them. These families may in turn be simplified and rendered easier of remembrance by dividing them into two classes—namely, the Up-winged (Ephemeridæ, Perlidæ, etc.) and the Flat-winged (Phryganidæ, etc.). The former are flies which proceed from the larvæ on the water, and float with wings erect; the latter have their wings placed flat on their bodies. As a rule, the former are gauzy, veined, and

almost transparent, and the latter much more coarse of texture, and almost opaque.

Now, it behoves the fly-fisherman to know something about the natural history of the flies he is about to imitate, and, as I detest long formularies and unnecessary technicalities, I shall endeavour to make my remarks as simple and practical as possible. The great family of the Ephemeridæ has been divided and subdivided by naturalists almost to infinity, and I doubt not this has to them been a labour of love worthy of all respect. But so far as we are concerned we may safely say, what careful study and research on my part has convinced me to be true, that for the angler there exists but four different species of the Up-winged insects, and these are the

Olive Duns, the Iron Blues, the large Brown Duns, and the Mayfly. On the Itchen, over the best part of which I have control, this is absolutely the case. The Mayfly, being the largest and chief of these flies, though not the earliest, I shall give a slight sketch of its history, at the same time premising that in effect the history of the Mayfly is the history of all the family with but little variation. The Mayfly in its larval and imago states is well known, and when it is added that it is found in all shades from yellow to yellow-brown, and even brown-black, you will confess it is a marvellously beautiful insect, I am sure.

The most important season to the fly-fisher also is that which witnesses the advent of the

Mayfly. During the last week in May or the first in June myriads of these gauzy-winged creatures rise from their whilom watery dwellings, and, after a period of fluttering in the air, descend to the water's marge on its circling eddies, to be sucked in by the trout till each fish is absolutely gorged. Then, above all periods, is the harvest-time of the fisher. With cunning imitation of the green or grey drake he plies his art, or even, be it regretfully said, with the natural fly itself. In either case his success is sure; and even if the fish do not require so much killing as at other times, the aggregate result at the day's end amply compensates him for his discounted sport.

The analogy existing between the transformations which the lepidopterous insects undergo during the course of their life-cycle, and the life, death, and resurrection of man, has often been brought forward by theological naturalists, and very apt and appropriate the analogue seems to be. The Rev. Mr. Kirby, in his "Introduction to Entomology," amongst others, has delightfully applied this series of embryonic developments to the changes of human existence. The changes, for instance, in the life of a butterfly are briefly as follows. First it is found in the form of an egg; this, when hatched, becomes the larva (from the Latin, signifying a mask). In this stage—as Linnaeus knew when he bestowed the name—the creature is the ultimate butterfly, with all its colours and beauties enwrapped and marked. Next it becomes a pupa (from the Latin, meaning an infant), and its covering folds it in like the wrappings of a mummy, in which manner it was customary at one time to case children. At last the comparatively inert chrysalis or pupa bursts its fetters and emerges to the light and sunshine of day a gorgeous insect rejoicing in its freedom. This last is termed its imago state.

The insect under consideration, however, has an additional and intermediate development between the pupa and full imago state, which unfits it for the analogue referred to, though perhaps one of the profoundest satires ever written on human nature is to be found in Franklin's address, supposed to have been spoken by an aged member of the Ephemeride, which had lived just four hundred and twenty minutes. This intermediate stage is termed the "semi-completa," or pseudimago state, and it is precisely because anglers have not been good enough entomologists to observe it that the green drake and grey drake have been generally regarded as the male and female. Really, as was pointed out long ago by Nichol, the former is the pseudimago, and the latter the perfected form or imago of the same insect.

The life-history of the Mayfly may be thus summarised. The ova are dropped into the water in such immense numbers, that though probably no more than one in a thousand survives its various enemies, yet wherever the fly is found it is in large quantities. As soon as the egg is hatched it turns to and commences to revenge itself on its former enemies, and consumes the eggs of other insects and fish with a voracity not easily credible. This in obedience to the grand law of the balance of life referred to probably by the moody Prince of Denmark: "A man may fish with the worm that hath eat of a king, and eat of the fish that hath eat of the worm," which in turn is but an amplification of "eat and be eaten."

Being aquatic animals, the larvæ breathe through a most beautiful provision of nature in the shape of spiraculous filaments extending down the thorax. These are distinctly finished breathing apparatus, and by no means either analogous or similar to the rudimentary gill-like processes of the tadpole or axolotl. After remaining in this stage of existence a period greater or less according to temperature, but probably not exceeding a year, the pupa stage supervenes. In no instances, it may be remarked, do the larvæ

of the Ephemeride form cases like the larvæ of the stone-fly or caddis, although this has been stated to be so. The pupa differs but little from the larva except in size, which is considerably increased. It feeds similarly, and only at the conclusion of this part of its existence does it exhibit any marks of the great change in its appearance which is approaching.

It lives as a pupa often as long as four years, and just prior to its migration airwards the wings of the ultimate fly may be detected folded tightly across the thorax. Eventually the moment arrives for its advent, or "rising," as it is colloquially termed. Seeking the shore, it emerges, climbing some convenient water-plant; its wings unfold, and, ere it has been more than a few minutes in the sunshine, they are extended. The insect then flutters them or flies, and has attained to the full development of its pseudimago state. It does not, however, in this position remain long. The rays of the sun arouse latent energies, and supply vitality for the ultimate change. In the semi-complete stage the Mayfly possesses a thin pellicle as a sort of overcoat protecting his full-dress for the water, and a trimming of delicate fringes is to be seen on the caudal filament and margin of the wings. Suddenly it may be seen that this splits in somewhat the same manner as does the shell of a lobster when the crustacean is shedding its coat, and the insect, instantly fulfilling its instincts, completes its æry nuptials in the space of a few hours or even less, to fall exhausted and dying, and is then swallowed by some swift-skimming swallow or voracious trout.

The distribution of the Mayfly is limited, and as uncertain as that of the mistletoe or grayling, or nightingale. The midland brooks of England possess it in abundance; the Colne in Middlesex, and the Hampshire and Derbyshire rivers, are also plentifully stocked with it. Some parts of the Thames abound with multitudes of a very large size; notably is this the case near Windsor. On the other hand, the Surrey Wandle and the Axe, as well as the chief lakes of England, seldom produce it; whilst the trout of some Irish loughs are perfectly gluttoned with the beautiful creature. And, as has been before observed, wherever it is found the number which arise almost simultaneously is truly prodigious. Reaumur gives a description of a scene of this kind witnessed by him on the banks of the Marne, which would be discredited did it not emanate from such an unimpeachably veracious observer. He says, "When the snow falls with the largest flakes, and with the least interval between them, the air is not so filled as it was around us with Ephemeræ; scarcely had I remained in one place a few minutes when the step on which I had stood was quite concealed with a layer of them from two to four inches deep." Mr. Pinkerton has also described a similar phenomenon which occurred under his observation, and further corroboration is not wanting to prove the multitudinous and fishy importance of what trout-fishers well know as the "rising" of the Mayfly.

This, therefore, is in brief the life-history of the chief of the up-winged flies. The small Duns—viz., Olive, Blue, Yellow, and Golden—are really only the different pseudimago stages, according to weather, of what eventually develop into the small Red-spinner. The large Browns, such as the March Brown and the Iron-blue Dun, are flies bearing a very close resemblance to the Mayflies, but only attain to about half their size. They are eagerly taken by the fish, and their different appellations will be given further on, when the most approved flies are named. Most of them, however, finally emerge as the large Red-spinner.

The flat-winged flies consist of a far greater number and variety of species, though they are quite of secondary importance in trout-fishing. The chief of those employed by the angler are the Red, Sand, Cinnamon

Stonefly, Yellow Sally, Willow, and Needle flies. These emerge from cases, and belong in their larval state to the large caddis family. Thousands of the caddis, cases and all, are devoured by trout; but when the fly is on the water the trout seem to care for them in a degree quite inferior to that which is exhibited by them for the up-winged species. I shall have a good deal to say about the imitations of the best of these three orders of flies, but in the meantime let me impress on you the wisdom conveyed in the words of David Foster, of Ashbourne, "The real essence of the art lies in deceiving the fish by a correct copy of any fly that may be at any time absorbing their attention."

To revert from the theoretical to the practical, I now proceed to refer to the tackle necessary for artificial fly-fishing, and the first consideration in this connection is the rod. No boy of my acquaintance is possessed of sufficient skill to make a satisfactory fly-rod, and I therefore must advise that the tyro save up his money and buy what he wants from some respectable tackle-maker, such as Farlow, of the Strand, or Little, of Fetter Lane, or Foster, of Ashbourne. For a single-handed weapon ten feet is quite long enough; and, if you can afford it, the very best are made of split cane glued up—i.e., the cane is selected and split into segments, and then accurately glued together and bound with silk at intervals. I saw a little beauty the other day with German-silver mountings—ferrules, joints, etc.—ten feet long, and what do you think it weighed? Just eight ounces; but it cost seven guineas at the great International Fisheries Exhibition. Of course the buyer of this was extravagant, for a rod costing half as much would have lasted a lifetime with care, and that is why I counsel the buying of a good one. Unless you step on a glued-up cane rod, the trout does not exist that can break it fairly.

The winch is another consideration, and beware of multiplying reels is my first note of warning. They are a delusion and a snare, and are always out of order. An ordinary bronzed check or check-reel will do for all purposes, whether for fly or bottom-fishing, or angling for the strong and impetuous pike. If the barrel of the winch—or, in other words, the axle on which the line is wound—be not more than three-eighths of an inch in diameter, and it is pretty certain not to be, it is a capital "dodge" to wind tape round it till it is quite half an inch through. This of course increases the rapidity with which a fish can be wound up, and also enables you without straining the line to pull out what is required for casting.

The line is of great consequence, and its selection requires a little attention. Do not buy too fine a winch-line. An eight-plait line dressed hard is quite fine enough; indeed, the "Acme" line, sold by Messrs. Foster, of Ashbourne, which possesses a fine copper wire woven with it, is the best line in the market. It is not too clumsy as regards size, nor is it too light—the copper gives it both weight and strength, and so increases the facility with which it can be cast as to make it a very pleasant and easy line to fish with. By all means get an "Acme" line in preference to any other if you can afford it. If you cannot spare the money you may economise thus. Send to Mr. Martin, of Lover's Lane, Newark-on-Trent, for an eight-plait silk line, undressed, and dress it yourself thus: Take of pure solid paraffin one pound, pure white resin a quarter of a pound—this can be increased according to experiment; melt them together in a pipkin, and whilst in a melted state—not too hot—soak the line. Let it remain in the solution till you think it is quite permeated with it. Then draw it out through a cork with a split in it. This takes off the superfluous dressing. Next, having stretched it out between nails, polish it with some powdered talc or finely-pulverised pumice-stone, and then you have a capi-

tally-prepared
line, quite equal
in appearance to
the best fourpence
per yard lines sold in the
first-class tackle-shops.

Thirty yards of line will ordinarily be sufficient on any trout stream, and it should always be dried after using. This latter is a golden maxim.

Gut is now so cheap, compared with what it used to be, that hair casting-lines are decidedly out of fashion. I was talking to an old Hampshire fly-fisherman the other night, and he told me that since he can recollect it was customary to tie the flies on to three twisted hairs, each one of course much thicker than the single gut of these times. Gut was extremely dear then. "Why, bless ye, sir, it's cheap enough to tie dogs up with now," said he; and I am inclined to think that, exaggerated as this statement unquestionably is, as compared with its price fifty years ago its present value almost warrants the old fellow's remark. You can buy the best gut for your purpose off any of the tackle-makers, that is if you choose to make

your own casting-lines; and you can get the lines themselves for a trifle over what they would cost you if you made them. Not less than three yards the line should be—four yards is even better; and the finer you can use the better will be your chance with the fish.

The next and perhaps most important part

of the whole subject is that of the flies. In Vol. III. B. O. P. will be found the whole *modus operandi* of fly-making, with remarks on their killing powers and natural history. I shall not go out of the way to repeat what was there said, but what I now put before my readers must be taken as supplementary.

Since those articles were written I have had two years' intimate experience of the chief and most difficult river in England as regards trout; and what I now put forward is the result of it in conjunction with the masters of the art dwelling in the locality. For a great deal of the following I am indebted to

Mr. Hall, of Weymouth, who is perhaps one of the most accomplished amateur fly-tiers in England, if not the world, especially as regards the smaller up-winged flies. In a recent communication published in the "Fishing Gazette" he has some capital dressings, which I quote with apologies to the editor of that paper.

Olive Dun.—Hooks, 0 and 00. Body, olive, a ribbing of fine gold wire is an improvement; wings, dark starling feather; legs and whisks at tail—a hackle stained olive—a dull brown. Another dressing is quill from the fibre of a peacock herl, wings and hackle as before; sometimes a gold tag is added. This is a pattern admitting of several shades, and is the best all-round pattern that can possibly be used in Hampshire. Another, same pattern as last, with light-brown fibres of hare's fur tied in for legs. Very good in April, and an excellent floater. Another—body, leveret's fur dyed olive, ribbed with gold wire; hackle and wings as before. This is known as the rough spring olive—a very useful variety. A very useful olive dun is also made from india-rubber for the body, which is continued from the hook, and cocks up like the actual fly. The wings are of starling, like the others.

Hare's Ear Dun.—Hook, 0 or 00. Body, hare's fur from the ear, ribbed with gold, and fibres picked out for legs, winged with dark starling, or (2) body, yellow silk, slightly waxed, hare's fur tied in at shoulder for legs. Wings as before.

Red, Grey, and Ginger Quill.—Hook, 0 or 00, usually the smaller size. Body, undyed quill. There is room for variety in choice of quill. The red one has for legs and whisk red hackle; wings, darkish starling. The grey and ginger are dressed with slighter wings.

The "Little Marryat."—Body, very pale buff opossum fur spun on light-yellow silk; wings, medium starling; legs and whisks, the patent feather from a buff Cochinchina cockerel.

The Iron-blue.—Body, quill peacock or condor (if it can be got) dyed a dark-blue with a violet shade; some prefer mauve silk with mole's fur. Legs and whisks, dark honey dun, the natural fly having yellow tips to its dusky-blue legs; wings, from the breast of the water-hen or from the tail-feather of the gootier titmouse.

The Red-spinner.—Body, quill dyed in

Judson's light-brown; wings, two hackle points chosen from bright shiny cock's feather, with golden tips; legs and whisks, a red hackle with black central rib. The natural fly has a thick shoulder and thorax which are unmistakably black.

The Badger Quill.—Body, greenish-olive quill, with a couple of white turns at the tail; legs and wings, a badger hackle—that is to say, a hackle with a rusty-grey centre and bright shining yellowish-grey points. The feathers are not easy to get. It does well with a quill body dyed in Judson's light-red. Hook 0 or 00.

Wickham's Fancy.—Hook 00 to 1 and 2. "Whenever the rise of fly is scanty or uncertain use a Wickham," says Mr. Hall. "If a stubborn old trout has refused all your delicate duns and spinners, try a Wickham, and in rough, wet weather, when dry fly-fishing is hopeless, the attractive Wickham is sometimes capable of digging up a few trout from the weedy depths when they can be tempted by nothing else. It should be made as follows: Body, gold tinsel, ribbed from tail to head with red cock's hackle; wings, dark starling. Landrail makes a nice variety.

Flight's Fancy.—Body, pale yellow or primrose silk ribbed with fine flat gold tinsel. Wings, light starling; legs and whisks, pale buff—or, for a change, honey-dun.

The Sedge-fly.—The silver sedge is thus made: Body, white floss silk ribbed with silver, hackled over with buff or light-red hackle; wings, landrail. Hooks, 00 to 1.

The Red Sedge.—Hook as before. Body, red fur from hare's face or fox's ear, or from the reddest part of the opossum's skin. Rib it with gold thread, wind on a red hackle from tail to head, ring it with a ruddy wing feather from a landrail's wing.

The Big Sedge or Cinnamon.—Same dressing as for red sedge, winged with the reddest part of a cock landrail's wing. Though true to nature, it is not well to dress the body thick, for the fly is apt to be lumpy and float badly. Hook No. 2.

The Alder.—Body, bronze-coloured peacock herl; hackle, black or dull-coloured feather with black centre and bronze tips. Wings, from the tail-feather of a hen-pheasant. Hook No. 2.

Brown Quill.—Body, light quill dyed in Judson's dyes a light-brown; legs and whisks, ginger; wings, starling. Hook, 00.

The Indian Yellow.—Body, delicate brown silk ribbed with bright yellow; legs and whisks, a rich buff; wings, from the under-wing feathers of a young grouse. Hook, 00. The head is of an orange hue, and is formed by a couple of turns of a rich dark orange.

The Little Sky-blue.—Body, pale straw-colour of silk, quill a fur; legs and whisks, light honey dun; wings, a pale delicate blue from a jay's wing-feather. Hook 00 or 000.

The Red Tag.—Body peacock herl, short and fat, with a tiny tag of red wool at the tail; at the shoulder a few turns of a dark rich red hackle. Hook, 00.

With these flies an angler may produce fish from any trout stream. They are easily tied if you go about it neatly and follow the directions given in Vol. III. B.O.P., or any tackle-maker would make them for you. Mr. G. Currell, of Jewry Street, Winchester, is especially and deservedly famed for all the patterns I have enumerated, and is reasonable in price. After all, however, everything depends on how you use these lures. If you put them clumsily on the water no amount of excellence in the fly will enable you to take fish. These patterns are in themselves killers on all the most difficult as well as easy streams, and if you do not find them successful it will be because you do not carefully attend to the instructions I am going to give you in throwing the fly. I therefore earnestly bespeak your careful attention to what follows

(To be continued.)

MONK THE MARINE.

THE "party" so named was not a man, but a monkey, and one, too, of most infinite humour. He went to sea, accompanied by a bear, with a relation of mine, who was captain of a small sloop of war, and who professed to take them with a view to keeping his men in good-humour. I believe it was to minister to his own amusement. Probably both objects were attained.

The monkey principally extracted his fun from the bear. This beast, which was of a saturnine character, indulged himself much in sleeping on the sunny side of the deck. On these occasions the monkey would overhaul his paws and twitch out any hair which he found matted by tar or pitch, the suffering which to remain seemed to be a great scandal in his opinion.

At other times he would open Bruin's eyelids and peep into his eyes, as if to ascertain what he was dreaming about. The bear, irritated at such liberties being taken with him, used to make clumsy attempts to revenge himself; but his persecutor was off in an instant. The rigging was, on these occasions, his place of refuge. Thither he

was indeed followed by his enemy; but poor Bruin was but an indifferent topman, and seldom got beyond the "lubber's hole."

The monkey, on the contrary, was famous for his activity, and for some time was named by the sailors "deputy captain of the foretop." He obtained this designation from a very singular practice. Having observed the excitement produced on board by the announcement of a sail ahead, which, as well as the chase which followed, seemed to be highly agreeable to him, the foretop became his favourite station, from whence he made his signals with great energy, chattering with a peculiar scream when any vessel was in sight, and indicating by signs in what direction it appeared.

Pug continued to volunteer his services for some time in this manner, and constantly found his reward. But at length, upon the sloop's getting on bad cruising-ground, he found his employment dull, and, by way of enlivening it, amused himself with giving false alarms.

He was started for this by the boatswain's mate, and lost his rank as deputy-captain of

the foretop. In lieu of which, moreover, he was new-named "Monk the Marine," a denomination which he certainly knew to be opprobrious, as he resented it with grimaces, chatter, and, whenever he dared, with blows.

Though he was fond of the excitement of a chase, he was not supposed to have good nerves; and those who had seen him in action (he was, after the first experiment, always sent below) made but an ill report of his steadiness under fire.

Poor Pug came to a melancholy end. He had observed a sick lieutenant, who breakfasted after the rest of his mess, making his tea, and being accidentally left alone in the gunroom, determined to imitate him. He, however, succeeded ill in his mixture; for he infused a paper of tobacco which was lying on the table, in the pot, instead of tea, and afterwards swallowed the concoction with its accompaniments of milk and sugar. This ill-imagined beverage produced the most fearful commotion in his inside, attended with long and loathsome vomitings, of which he finally died.

SCHOOL CRICKET.

SCHOOL CRICKET is ever on the increase, and in its growth has now attained a certain level of excellence which has rendered the pre-eminence of the more fashionable establishments a thing of the past. The public schools coming under the Commissioners no longer have the monopoly of cricket teaching, and the game is practised as a study throughout the country. The change is a welcome one now that the old idea of merely playing at playing has been exploded. There is no healthier lesson to be learnt in life than that happiness depends on putting the heart into all we have to do; dawdling neither in work nor play, but in play as in work being earnest and thorough.

So numerous are the schools claiming the notice of the cricket reviewer, that unless with inordinate space his article is likely to descend into a mere statistical summary. In an article on 1884 this danger is particularly to be feared owing to there having been hardly a team or an individual of conspicuous merit. The average was far higher than usual, but there were few shining lights or striking failures. Perhaps we had better, therefore, adhere to our old plan and take a selection from the schools in alphabetical order.

Many a close election has been decided in these balloting days by the position of a name on the paper. We have all such a tendency to vote for the first thing we see that the name at the head of a list is always sure of a good reception. To this fact Ardingly owed some of the attention which the excellent cricket of Bettsworth, Blackman, Newham, and Brann has now secured for good. As usual, the M.C.C. match resulted in a win for the school, this time by 117 runs; and, as usual, the highest batting average, Brann's 46, is almost the highest of the year. His total included two scores of over 100.

The two great Bedford schools, the Grammar and the Modern, are better known for their prowess on the water than in the cricket-field; but that they are not entirely given over to pursuits aquatic their records for the season clearly show. The Grammar School eleven included P. Christopherson, who took his 65 wickets for an average of 9; and P. T. Bell, who among his scores counted two centuries—one of 122 against Wollaston Park—and in sixteen innings secured an average of 32. The three Birmingham schools—King Edward's, the Oratory, and Oscott—were also busy. The High School won 4 matches out of 11, the Oratory won 5 out of 11, and Oscott won 4 out of 9.

Brighton lost the Lancing match and the Dulwich match; and, in fact, out of a card of twelve engagements only secured one victory. The season was, however, noticeable for the excellent play of the captain, G. H. Cotterill, who made almost a third of the runs obtained by the team, and had the really good average of 35.

Charterhouse won six matches out of fourteen. Two of its eleven, Causton and Coulby, made nearly half the runs, and their averages of 28 and 30 are separated by a wide interval from those of their comrades. The best scores were made by Coulby, who secured 118 against the Cavalry Brigade, and 123 against the Racquet Players. The Westminster match was won; the Wellington match was lost.

Cheltenham were unfortunate in having to draw both their Clifton and Marlborough matches when going well in their favour. The averages were very level; those of ten of the team ran to double figures. E. M. Hamilton distinguished himself in the Clifton match by a long innings of 130, and the captain, Heath, showed himself to be a really good bat, though his average, 21, was equalled by Glass and exceeded by Robinson.

The great school on the Thames Embankment, the City of London, won but a fifth of its matches, and rejoiced in a curiously modest average return, with only one instance of double figures. Clifton found a wicket-keeper in R. H. Johnston destined to make his mark in the world, but otherwise the season was poor. Two matches out of eleven is not a very cheering report, though six draws, including the school matches with Cheltenham and Sherborne, reduced the losses to three—one of them, the Lord's engagement, being a crushing defeat to the extent of an innings and 46 runs.

Devon County School boasted five bowlers, the most expensive of whom required only six runs per wicket, and the best of whom, Hill, required only four. Its summary gives eight wins out of eleven. Dulwich won eight out of fifteen and lost six, its averages being headed by A. P. Douglas with 31, who scored 138 in the Surrey Sessions match. Though Eastbourne won seven matches out of fifteen and lost five, its record was of that topsyturvy character in which the runs lost on the bowling averaged more than those gained on the batting.

Eton won the Winchester match by five wickets, although in the first innings none of the eleven got into double figures. It was a very fortunate thing for the Light Blues that the weather interfered to make the Harrow match a draw. The results of the season—five losses out of ten, and only three wins—show that the team was hardly up to its level, although in Lucas, Thomas, Philipson, and Forster it had four good men. Forster in the Oriel match made 102—the highest score of the team during the year—and he also distinguished himself in the bowling department, having the capital average of 24 for eleven. The averages were headed by R. J. Lucas, the captain, with 27, F. Thomas, this year's captain, coming next with 23.

The doings of the Scotch schools are kept very much in the dark, owing doubtless to the innate modesty of their pupils. At the same time when Mr. Holms can make 303 not out for Blair Lodge, Mr. Bettsworth not out 203 for the same school, and Mr. H. L. Fleming 168 and 114 for the same school, it is, we think, a pity more details do not find their way to this side of the Tweed. Perhaps as the teams have a strong element of masters and professionals there may be an objection to this until the boys are skilled enough to trust entirely to themselves. Should such be the case we wish Blair Lodge and its fellows a speedy growth in that cricket proficiency of which there is good promise. Fettes had a strong eleven in 1884, and lost but two matches out of a dozen, its average list showing eight of its team with double figures, and four bowlers with singles. Loretto, which touches the English lists owing to the Rossall match, had a somewhat unsatisfactory season considering the excellent bats in the eleven. The main matches against Rossall and Fettes were drawn, but the Stonyhurst and Merchiston engagements were lost, though those with Blair Lodge and Craigmount were won. Altogether out of sixteen trials 8 were lost and 5 won. L. R. Patterson with 27 heads the averages, having made two scores over the hundred, one against the Edinburgh Garrison, the other against Edinburgh Royal Academy, J. B. Harvey, who scored a splendid innings of 106 against Rossall, averaging only 12. But in order to find fitting company for Fettes we have strayed from our order, and must resume.

Haileybury beat Wellington by an innings and 69 runs. The team was an exceptionally good one, and, like a bear, had no tail to speak of. Nine of its members averaged double figures, and one of them, D'Aeth, compiled a century against the Marlborough

Blues. Campbell's thirty-four wickets for ten runs a piece was also a notable performance, his best achievements having been in the Wellington match, when he took five wickets for eight runs, and in the Old Boys match, when he cleared out the eleven for 32. Five wins out of eight engagements is a greater measure of success than usually falls to school teams.

Harrow drew the Eton match very much in its favour, and won four matches out of ten. The Lord's match was the sixtieth of the series, and the tenth draw, six of the draws having occurred during the last ten years. Each side claims half of the fifty played out, so that some interest attached to the meeting, especially as in the two previous years the match had had to be abandoned. In the Harrow score of 126 and 152 for six wickets W. A. R. Young was top scorer with not out 23 and not out 35. In the Eton innings of 82, in which, by-the-by, the five first wickets went for 31, Lord George Scott headed the total with 32. The best batting average of the team was Buxton's 24, Butler, the captain for last year and this, only securing 13.

Lancing covered itself with glory by drawing the match with Brighton "owing to unavoidable circumstances." The other side had not a chance at the wickets. Lancing went in first and remained all day to score 465, of which H. Hammond contributed 214, and A. Hammond 120. The return match played at home was won by nine runs and seven wickets, which means that Brighton were all out for 78, and that Lancing had lost only three wickets and made 87 when the stumps were drawn. As a set-off to these successes came the loss of the Tonbridge match by 150 runs. The season's result shows four wins and five losses out of eleven. The averages are headed by H. Hammond with 30, W. H. Brown coming next with 20. In addition to this 120 against Brighton College, A. Hammond also scored 137 against East Somerset.

Remarkable as was the scoring of Lancing against Brighton, that of Leamington against Coventry Grammar School threw it into the shade. Leamington lost only eight wickets during the day and scored 509. Four of the batsmen did not reach double figures, but of the others A. Passman made 121, J. B. Wood 106, D. R. Adaye 90, A. Hepburn 66, and G. A. Floyd 60, giving an average for the five of 88, and for the eight wickets of 63!

Malvern had a very fair eleven, and, though it lost the Repton and Bradfield matches, secured seven victories out of fourteen engagements. Its averages were headed by J. H. Copleston, who, with the captain, F. Yardley, is now at Oxford. His high return of 44 owed a good deal to his splendid innings of 132 against the Old Boys, the said 132 being his second century for the year.

Marlborough was unlucky in 1884. It had a good level eleven, and yet only gained one match. Fortunately this was the Rugby fixture at Lord's, which was won by eight wickets; the Cheltenham match was drawn. The averages were headed by J. P. Cheales, whose 171 against the Hampshire Gentlemen went well towards his high return of 36.

Norfolk County School won ten matches out of thirteen, Radley five out of fourteen, Repton six out of eleven, including both the Malvern and Uppingham matches. Rossall beat Shrewsbury by ten wickets, though the summary of three wins out of eleven matches was not as satisfactory as was hoped.

Rugby only won twice out of ten tries, the old experience of the uselessness of a purely batting team for winning purposes being once more confirmed. When the bats fail, as they did in the Marlborough match, their chance is hopeless. Eleven out of 49, and no double figures amongst them, is, however, a run of

ill luck that does not often occur. Let us "hope that it will not occur again," more particularly when Marlborough is this year met on the 29th of July. Of the twenty-seven matches Rugby has, however, won eighteen, so that a few losses to the Wiltshire school can be well afforded.

Sherborne won three matches out of nine, the Clifton match being one of the draws; the averages were headed by E. A. Nepean with 37, and J. B. G. Lester with 21, both batsmen of great promise. Shrewsbury won four matches out of ten, losing the Rossall match by ten wickets; the averages were headed by F. W. Burbury with 39, and by Kemp with 28.

Tonbridge had the best record of the year, seven wins out of ten, and only one loss, that to the M.C.C. The best batsman of the year, W. Rashleigh, was in the team, which averaged no less than 230 runs per innings. Rashleigh's average of 64 was swelled by his long score of 203 against Dulwich; and his 160 against Lancing and 134 against the Assyrians all came in aid thereof. A. O. Hubbard, the second on the list, also claimed a century—that secured against the Old Boys. Such entries in the "Remarks" column as "Won by 380 runs," "Won by 150 runs," "Won by 231 runs," "Won by 142 runs," receive due appreciation among the happy members of a school club, and especially when the team that earned them is generally acknowledged to be the best of the year.

Uppingham is feeling the inevitable ebb-tide which surely overtakes for a while every school, though three wins out of nine is not so bad a return on paper as the fact that the

wins were all in May and the losses and draws all in June and July would seem to imply. Wellington, under the new rule which obliges every boy in the Lower School to play at least one game of cricket a week, has undergone an awakening; though the want of a bowler told heavily against the team. In the victorious match with Charterhouse, nine of the team gained double figures, an unusual and healthy sign. This year Prince Christian Victor will captain a very promising eleven.

The Westminster team of 1884 was a poor one, and so was that of Winchester. Westminster had two good men in Hurst and Armitage; Winchester had two good men in Watson and Jones; and Westminster and Winchester had each a tail of nine. The parallel can be carried even farther. Westminster played ten matches, Winchester played ten matches; Westminster won two matches, Winchester won two matches; Westminster lost seven matches, Winchester lost seven matches. The match drawn by Westminster was against the Free Foresters, the match drawn by Winchester was against I Zingari. Westminster lost its great match of the season, that against Charterhouse; Winchester lost its great match of the season, that against Eton. Even the batting averages correspond, Armitage heading those of Westminster with 20, and Watson heading those of Winchester with 20. And also do the bowling averages, both Nicholls for Westminster and Hurst for Winchester claiming 13. And with this the most curious of curiosities we end our summary with the usual "Floreat Cricketa!"

CHESS.

GO-BAN.

(See pages 6, 31, 62, 221, and 474.)

GAME No. 5.

Played between H. M. (White) and L. S. (Black).

White to play, and win in five moves.

The white men are on the squares b4, c2, c4, c5, c6, c7, d4, e3, e4, e5, f2, and g4.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Writing Competition.

(Continued from page 478.)

SENIOR DIVISION (ages 21 to 24).

Prize—One Guinea.

CHARLES N. NAPIER (aged 22), care of M. W. Ness, 7, Radnor Terrace, Dumbarton Road, Glasgow, N.B.

Certificates.

JOHN S. DE VLETER, care of J. G. Fraser, Esq., attorney-at-law, Bloemfontein.

HENRY MORRIS, Bower Place, Maidstone.

HERBERT E. HURD, Elmcroft, Tottenham Lane, Hornsey, N.

HENRY KNIGHT, 27, Rangemore Street, Burton-on-Trent.

ARTHUR J. DURRANT, 63, Farringdon Street, E.C.

W. E. BULL, Staunton Harold, Ashby-de-la-Zouch.

HENRY POLGREEN, St. Germans, Cornwall.

WILLIAM L. VARNON, Castle Street, Hinkley.

JAMES B. CRAIGIE, 22, Apsley Place, Glasgow.

ALBERT E. NIXON, 171, Downham Road, Southgate Road, N.

G. T. F. CLARKE, Ingestre, Stafford.

CHAS. F. PETERS, 67, Bengel Street, Liverpool, E.

JOSEPH G. ROWLEY, 37, Holms Street, Great Cambridge Street, Hackney Road, E.

FREDK. WAITE, 40, Moscow Road, Bayswater, W.

W. R. MARTIN, Old Bank, Altrincham, Cheshire.

JAMES E. CHURCH, 40, Enbrook Street, Queen's Park, W.

HARRY METCALFE, 3, York Place, Richmond, Yorks.

FREDK. D. ALLEN, 45, Ellington Street, Barnsbury, N.

JAMES P. STEPHENSON, Baldock Street, Ware, Herts.

EDWIN MORRIS, 32, Castle Street, Shrewsbury.

J. W. CROWTHER, Victoria Road, Todmorden.

JOHN ROBERTSON, 18, Kenmure Street, Pollokshields, near Glasgow.

JAMES LOVELAND, 24, Plymouth Place, Leamington.

JOSEPH S. UPTON, Highbridge Street, Waltham Abbey.

J. W. BIRTLEY, 27, Mulgrave Terrace, Gateshead.

TERRILL KENNEY, Savings Bank Department, General Post Office, Cape Town, South Africa.

THE "BOY'S OWN" GORDON MEMORIAL FUND.

(Continued from page 479.)

SINCE our last number went to press—and, as our readers understand, our large circulation necessitates our printing at least a month in advance of the actual date of publication—we have received a spontaneous letter from the Editor of the "Globe," the well-known London evening newspaper, which it may be well to quote. Of course, when he wrote he could have known nothing of what we had actually done and were doing in the matter. His letter, which is dated Wednesday, March 25th, but did not reach us until the following day, asks:—

As the recognised organ of British boyhood, your journal could give the project sketched in the enclosed cuttings a most powerful helping hand. Could you see your way to do so? . . . Gordon's love for the young and helpless could not, I think, be more fittingly commemorated than by a Refuge for Waifs and Strays, erected at the cost of English boys.

The cuttings referred to in this letter were as follows—the first being an Editorial paragraph from the "Globe" of March 19th, and the second from the edition of March 25th:—

The suggestion made in our "By the Way" column on Tuesday, that the boys of England should get up a memorial of their own to the dead hero who loved them so deeply, has already elicited a chorus of approval. Among numerous correspondents who have addressed us on the subject, the head master of St. Ives School, Huntingdon, writes that on putting the matter before his pupils he found them as enthusiastic as unanimous in their desire to give effect to our suggestion. Our correspondent further expresses his conviction, with which we entirely agree, that if other head masters were to follow his example the same response would be given. . . . We cannot undertake to receive subscriptions—a proposal which has come

to us from several quarters—but we should be most willing to help the movement by all other means in our power. . . . It will afford us much pleasure to publish, from time to time, such particulars of the progress made by the good work as may be forwarded to us. The matter now rests with the boys of England and their teachers.

Since last week we have received a number of communications highly approving of our suggestion that the boys of England should get up a memorial of their own to the heroic Gordon. The only difficulty appears to be that of organisation. At every school where the subject has been brought forward the pupils have given a most enthusiastic response, not merely in words, but in donations made on the spot. The head master of one of the leading private schools at the West End gave out subscription sheets to each form, and entrusted all the rest to the boys themselves. In a very short time several pounds were collected, and the only question now is where to send the money. . . . The boys are ready, their money is ready, their masters are ready, and it would be a thousand pities if a most praiseworthy enterprise of philanthropy, so happily begun, were to end in nothing for want of organisation.

We at once wrote in reply:—

"May I venture to trespass on your columns, *apropos* of the suggestion in your Notes of yesterday, to state that, in response to solicitations from all parts of the kingdom—alike from parents and their sons—we have resolved to open a BOYS' GORDON MEMORIAL FUND in connection with the BOY'S OWN PAPER, acknowledging in our columns all subscriptions received, issuing collecting-cards, and in other ways seeking effectively to help on the good work.

"The precise form that the memorial should take has been carefully considered; and though all the details are not yet finally settled, it has been definitely determined that the memorial shall be wholly on the lines known to be in accordance with Gordon's own wishes. A Working Boys' Home of Rest, at the seaside, is included in the scheme.

"When I mention that British boyhood has already, through our columns, recently placed two Lifeboats on the coast—at a cost of over £1,200—and also subscribed £400 for a Cot in the London Hospital, it will be readily understood how genuine a success the BOYS' GORDON MEMORIAL is likely to be.

"56, Paternoster Row, E.C.,
March 26th, 1885."

This, then, for the present, sufficiently explains our project, of which the details will be supplied from time to time; and now let us see how the work is to be done.

WAYS OF WORKING.

1. First, it is well to remember that it will be best in all cases where it can be managed—as in schools, families, etc.—that one correspondent should undertake to collect the various smaller sums and forward them in one amount. The decided saving in postage and trouble is not the only gain here.

2. In the villages—as in offices and workshops—one person might suitably be appointed to act as secretary or collector; and in the larger towns district committees might be formed, with the clergyman, minister, or other known and responsible person, as treasurer. In schools, both public and private, the masters would in most cases, we doubt not, be found willing heartily to co-operate, and to act as treasurers if needs be.

3. *Collecting-cards* will be furnished to all who, in applying for them, enclose a properly addressed and stamped envelope, accompanied by a letter of recommendation from clergyman, tutor, employer, or other responsible person. The necessity for this must be obvious. *All cards thus sent out will be duly numbered, and registered with the names and addresses of the applicants, and thus the chances of any cards getting into the wrong hands will be effectively guarded against.*

4. *Donations may be sent at once*, and all amounts received will be acknowledged in due course in the columns of the "BOY'S OWN PAPER." Cheques should be crossed, and P.O.O. made payable to H. WILLIAMS. *Coins should in no case be sent through the post.* Postage stamps will be received, but by far the best way of sending small amounts is by POSTAL ORDER. These may be obtained of any value, from 1s. upwards, at any post-office, the charge being 3d. for 1s. or 1s. 6d.; 1d. for 2s. 6d., 5s., or 7s. 6d.; 2d. for 10s., 12s. 6d., 15s., 17s. 6d., or 20s.

Correspondence.

J. R.—Have nothing to do with photographs of pictures unless you purchase them at some well-known shop. Those that you mention are probably pirated.

S. H. RAY.—You will find the particulars regarding Bishop Patten in Miss C. M. Yonge's "Life," published by Macmillan and Co.

S. HOPEWELL.—The volume ends with the last number for September. The indexes cost one penny each, and can be obtained direct from us or through your news-agent.

MANUSCRIPT.—Each University publishes a calendar, giving the particulars of fees, scholarships, and examinations.

SHAKESPEAR.—The present popularity has nothing to do with the part sale, and it is notorious that more copies of the Waverley

Novels have been sold than of any other works of fiction in the world.

S. T. MENGINE.—The steam-pipe is usually made of copper.

HARRY.—For the origin of the term "Black Watch" see back numbers, or consult the index.

T. F. P.—1. Rome is now the capital of Italy. The reason that Florence is given in some books is that the change has been made since they were published. 2. No. is an abbreviation of "numero"—hence the o.

J. MC MILLAN.—Never be too certain of the nationality of a tune. Even the "Lochaber no more" you quote is claimed as an Irish air.

E. L. O.—The Haarleem organ is by Christian Müller, and has sixty stops and 4,088 pipes. The Weingarten organ has seventy stops, and originally had 6,666 pipes; and it is said that the monks, who were very rich, were so pleased with it, that they gave Gabler, the maker, 6,666 florins over and above his charges.

CUSSY.—We should leave the mouse alone, but see that he did not want for food. "A black-spotted mouse, that follows us from room to room, and even sits on the fender and washes its face while we are sitting by the fireside, and sings away, and will feed out of your hand," is a treasure that when found should be made the most of.

C. W. H.—Even a lawyer would be in doubt, as the matter is so obscure. Speaking generally, rivers are not open unless they have a towing-path.

T. C. D.—The Royal Marines are under the jurisdiction of the Admiralty.

D. T. MITCHELL.—The Great Eastern is now at New Orleans as one of the attractions of the exhibition.

W. KNIGHT.—We have not an enlarged copy of the fretwork design for the cover, but you can make one by means of the pantograph, described in the fifth volume.

BOW BELLS.—1. The bridge of a violin should be placed in a line with the nicks of the sound-holes. 2. A genuine Stradivarius is worth from £100 to £500, but the possessors of nearly all the genuine instruments are known by the dealers. Cremona fiddles are like old masters, and every change of ownership is carefully noted by those whose interest it is to effect the transfer. 3. Spell as we spell now. Never refer to an old book as an authority on the subject. The instance you give is a queer one, but what do you say to your friends the drum and fife under their old guise of the "drumme and phiph"? A tutor for the "phiph" is still in existence.

LAMINA.—Soak the leaves in soft water till they rot. Pick the decayed matter off with a pin. Wash carefully in running water, and bleach with chloride of lime. Another and quicker plan is to place a layer of leaves on a thin layer of soap, on it lay more soap, and build up a series of layers. Then put them in a mass into a saucepan and boil slowly.

LIGHT.—For books on electric lighting look up in the library catalogue A. Bromley Holmes on "Practical Electric Lighting;" R. E. Crompton on "The Electric Light for Industrial Uses;" T. B. Grierson on "Electric Lighting by Water Power;" Killingworth Hedges on "Useful Information on Electric Lighting;" and J. B. Hammond on "The Electric Light."

G. COLLIER.—Such fun is but folly after all. The examples are so numerous. Here is one of American origin, which, if not that you require, may serve your purpose just as well:—

Oh, for some deep secluded dell,
Where brick and mortar's line may cease;
To sit down in a pot of grease—
No, no—I mean a grot of peace!

I'd choose a home by Erin's wave,
With not a sound to mar life's lot;
I'd by the cannon have a shot—
No—by the Shannon have a cot!

How fair that rocky isle around,
That wide expanse to scan it o'er
I love a shiver with a roar—
No—I mean a river with a shore!

Romantic Erin's sea-girl land,
How sweet with one you love the most
To watch the cocks upon the roost—
No—I mean the rocks upon the coast!

'Twere sweet, at moonlight's mystic hour,
To wander forth where few frequent,
And come upon a tipsy gent—
No—I mean a gipsy tent!

In that retirement lone I would
Pursue some rustic industry,
And make myself a boiling tea—
No, no—I mean a toiling bee!

Beneath a shady sycamore,
How sweet to breathe love's tender vow;
Your dear one bitten by a sow—
No—I mean sitting by a bough!

Or, sweet with your fond wife to sit
Outside your door at daylight's close,
While she's hard hitting at your nose—
No—I mean hard knitting at your hose!

Perhaps on early cares you brood
While sympathy her sweet face shows,
'Tis good to walk upon one's toes—
No—I mean to talk upon one's woes!

She smiles you into jest at last,
As pleased to see the spell is broke,
And draw from you a gentle moke—
No, no—I mean a mental joke!

HOPEFUL.—We never answer legal questions, or give information that we are informed may lead to litigation. If you want to learn the law, go to a lawyer; he is supposed to know all about it, and on account of that supposition he earns his living. He will enlighten you as to the way in which a man, fancying he can shuffle out of an engagement owing to the omission of a stamp, can be painlessly undeceived.

SHINER.—Yes, from a tree—the lacquer-tree, *Rhus vernicifera*. It is met with all over the main island, and Kinshin and Shikoka; but it is from Tokio northwards that it chiefly flourishes. The lacquer-tree is grown from seeds; the first year it reaches the height of a foot, the following spring the young are transplanted about six feet apart, and in ten years the average tree is ten feet high, with a trunk three inches in diameter, and a yield of lacquer sufficient to fill a three-ounce bottle. About 140,000 gallons of lacquer are annually produced in Japan.

H. G. B.—There is no children's hospital supported by subscribers to the BOY'S OWN PAPER, but there is a BOY'S OWN PAPER cot in the children's ward at the London Hospital, the great hospital in the east of London.

C. A. B.—The inhabitants of Hungary—the Hungarians—call themselves Magyars; and all stamps with Magyar on them are Hungarian.

O. YORKE.—1. The idea that the metre is really a measurable portion of a quadrant of the earth's circumference is no longer entertained. The metre was intended to be so, and that is all you can say. The earth is not a perfect geometrical figure. 2. A gallon of water weighs ten pounds, and a yard of inch-square forged iron weighs ten pounds, so that a gallon of water is of the same weight as thirty-six cubic inches of iron. 3. The real standard of the French system is the platinum kilogramme weight deposited at Paris. The theoretical standard is that a cubic decimetre of distilled water at 39.1 Fahrenheit will weigh a kilogramme.

G. L. N.—The lobelia was named after Lobel, Queen Elizabeth's physician, who is famous as having discovered the two great divisions of the vegetable kingdom—the dicotyledons and the monocotyledons.

P. D.—It is quite true. By the twitchings of the man's muscles, Dr. Hughes Bennett discovered that a tumour of limited dimensions was ensconced at a particular point on the ascending frontal convolution on the right side of the brain, and so he opened the patient's skull, and exactly at the spot indicated a tumour about the size of a walnut was found. The tumour was removed, and the patient recovered.

T. WYCOMBE.—Most of the lead now comes from Spain. About 120,000 tons are thence exported annually. America exports 100,000 tons; Germany 90,000 tons.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER VI.

REGINALD'S PROSPECTS DEVELOP.

It was in anything but exuberant spirits that the two Crudens presented themselves on the following morning at the workmen's entrance of the Rocket Newspaper Company, Limited. The bell was

Gedge and Reginald in the Composing-room.

beginning to sound as they did so, and their enemy the timekeeper looked as though he would fain discover a pretext for pouncing on them and giving them a specimen of his importance. But even his ingenuity failed in this respect, and as Horace passed him with a good-humoured nod, he had, much against his will, to nod back and forego his amiable intentions.

The brothers naturally turned their steps to the room presided over by Mr. Durfy. That magnate had not yet arrived, much to their relief, and they consoled themselves in his absence by standing at the table watching their fellow-workmen as they crowded in and proceeded with more or less alacrity to settle down to their day's work.

Among those who displayed no unseemly haste in applying themselves to their tasks was Barber, who, with the dust of the back case-room still in his mind, and equally on his countenance, considered the present opportunity of squaring up accounts with Reginald too good to be neglected. For reasons best known to himself, Mr. Barber determined that his victim's flagellation should be moral rather than physical. He would have liked to punch Reginald's head, or, better still, to have knocked Reginald's and Horace's heads together. But he saw reasons for denying himself that pleasure, and fell back on the more ethereal weapons of his own wit.

"Hullo, puddin'ead," he began, "ow's your pa and your ma to-day? Find the Old Bailey a 'ealthy place, don't they?"

Reginald favoured the speaker by way of answer with a stare of mingled scorn and wrath, which greatly elevated that gentleman's spirits.

"Ow long is it they've got? Seven years, ain't it? My eye, they won't know you when they come out, you'll be so growed."

The wrath slowly faded from Reginald's face as the speaker proceeded, leaving only the scorn to testify to the interest he took in this intellectual display.

Horace, delighted to see there was no prospect of a "flare-up," smiled and began almost to enjoy himself.

"I say," continued Barber, just a little disappointed to find that his exquisite humour was not as electrical in its effect as it would have been on any one less dense than the Crudens, "ow is it you ain't got a clean collar on to-day, and no scent on your 'andkerchers—eh?"

This was getting feeble. Even Mr. Barber felt it, for he continued, in a more lively tone,

"Glad we ain't got many of your sickening sort 'ere; snivelling school-boy brats, that's what you are, tired of pickin' pockets and think you're goin' to show us your manners. Yah! if you wasn't such a dirty ugly pair of puppy dogs I'd stick you under the pump—so I would."

Reginald yawned and walked off to watch a compositor picking up type out of a case. Horace, on the other hand, appeared to be deeply interested in Mr. Barber's eloquent observations, and inquired quite artlessly, but with a twinkle in his eye,

"Is the pump near here? I was looking for it everywhere yesterday."

It was Mr. Barber's turn to stare. He had not expected this, and he did not like it, especially when one or two of the

men and boys near who had failed to be convulsed by his wit laughed at Horace's question.

After all, moral flagellation does not always answer, and when one of the victims yawns and the other asks a matter-of-fact question it is disconcerting even to an accomplished operator. However, Barber gallantly determined on one more effort.

"Ugh—trying to be funny, are you, Mr. Snub-nose? Best try and be honest if you can, you and your mealy-mug brother. It'll be 'ard work, I know, to keep your 'ands in your own pockets, but you best do it, do you 'ear—pair of psalm-singin' twopenny-ha'penny puppy dogs!"

This picturesque peroration certainly deserved some recognition, and might possibly have received it had not Mr. Durfy's entrance at that particular moment sent the idlers back suddenly to their cases.

Reginald, either heedless of or unconcerned at the new arrival, remained listlessly watching the operations of the compositor near him, an act of audacity which highly exasperated the overseer, and furnished the key-note for the day's entertainment.

For Mr. Durfy, to use an expressive term, had "got out of bed the wrong side" this morning. For the matter of that, after the blowing-up about the back case-room, he had got into it the wrong side last night, so that he was doubly perturbed in spirit, and a short conversation he had just had with the manager below had not tended to compose him.

"Durfy," said that brusque official as the overseer passed his open door, "come in. What about those two lads I sent up to you yesterday? Are they any good?"

"Not a bit," growled Mr. Durfy; "fools both of them."

"Which is the bigger fool?"

"The old one."

"Then keep him for yourself—put him to composing and send the other one down here. Send him at once, Durfy, do you hear?"

With this considerably worded injunction in his ears it is hardly to be wondered at that Mr. Durfy was not all smiles as he entered the domain which owned his sway.

His eye naturally lit on Reginald as the most suitable object on which to relieve his feelings.

"Now then, there," he called out. "What do you mean by interfering with the men in their work?"

"I'm not interfering with anybody," said Reginald, looking up with glowing cheeks, "I'm watching this man."

"Come out of it, do you hear me. Why don't you go about your own work?"

"I've been waiting here ten minutes for you."

"Look here," said Mr. Durfy, his tones getting lower as his passion rose; "if you think we're going to keep you here to give us any of your impudence, you're mistaken; so I can tell you. It's bad enough to have a big fool put into the place for charity, without any of your nonsense. If I had my way I'd give you your beggarly eighteen shillings a week to keep you away. Go to your work."

Reginald's eyes blazed out for a moment on the speaker in a way which made Horace, who heard and saw all, tremble. But he overcame himself with a mighty effort, and said,

"Where?"

Mr. Durfy glanced round the room.

"Young Gedge!" he called out.

A boy answered the summons.

"Clear that rack between you and Barber, and put up a pair of cases for this fool here, and look after him. Off you go! and off you go," added he, rounding on Reginald, "and if we don't make it hot for you among us I'm precious mistaken."

It was a proud moment certainly for the cock of the Fifth at Wilderham to find himself following meekly at the heels of a youngster like Gedge, who had been commissioned to put him to work and look after him. But Reginald was too sick at heart and disgusted to care what became of himself as long as Mr. Durfy's odious voice ceased to torment his ears. The only thing he did care about was what was to become of Horace. Was he to be put in charge of some one too, or was he to remain a printer's devil?

Mr. Durfy soon answered that question.

"What are you standing there for?" demanded he, turning round on the younger brother as soon as he had disposed of the elder. "Go down to the manager's room at once, you're not wanted here."

So they were to be separated! There was only time to exchange one glance of mutual commiseration, and then Horace slowly left the room with sad forebodings, more on his brother's account than his own, and feeling that as far as helping one another was concerned they might as well be doomed to serve their time at opposite ends of London.

Gedge, under whose imposing auspices Reginald was to begin his typographical career, was a diminutive youth who, to all outward appearances, was somewhere about the tender age of fourteen, instead of, as was really the case, being almost as old as Reginald himself. He was facetiously styled "Magog" by his shop-mates, in allusion to his small stature, which required the assistance of a good-sized box under his feet to enable him to reach his "upper case." His face was not an unpleasant one, and his voice, which still retained its boyish treble, was an agreeable contrast to that of most of the "gentlemen of the case" in Mr. Durfy's department.

For all that Reginald considered himself much outraged by being put in charge of this chit of a child, and glowered down on him much as a mastiff might glower on a terrier who presumed to do the honour of his back yard for his benefit.

However, the terrier in this case was not at all disheartened by his reception, and said cheerily as he began to clear the frame,

"You don't seem to fancy it, I say. I don't wonder. Never mind, I shan't lick you unless you make me."

"Thanks," said Reginald, drily, but scarcely able to conceal a smile at this magnanimous declaration.

"Magog" worked busily away putting away cases in the rack, dusting the frame down with his apron, and whistling softly to himself.

"Thanks for helping me," said he, after a time, as Reginald still stood by doing nothing. "I could never have done it all by myself."

Reginald blushed a little at this broad hint, and proceeded to lift down a case.

But he nearly upset it in doing so, greatly to his companion's horror.

"You'd better rest," he said, "you'll be fagged out. Here, let me do it. There you are. Now we're ready to start you. I've a good mind to go and get old Tacker to ring up the big bell and let them know you're just going to begin."

Reginald could hardly be offended at this good-natured banter, and, as Gedge was after all a decent-looking boy, and aspirated his "h's" and did not smell of onions, he began to think that if he were doomed to drudge in this place he might have been saddled with a more offensive companion.

"It's a pity to put Tacker to the trouble, young un," said he; "he'll probably ring when I'm going to leave off, and that'll do as well."

"That's not bad for you," said Gedge, approvingly, "not half bad. Go on like that, and you'll make a joke in about a fortnight."

"Look here," said Reginald, smiling at last. "I shall either have to punch your head or begin work. You'd better decide which you'd like best."

"Well, as Durfy is looking this way," said Gedge, "I suppose you'd better begin work. Stick that pair of empty cases up there—the one with the big holes below and the other one above. You needn't stick them upside down, though, unless you particularly want to; they look quite as well the right way. Now, then, you'd better watch me fill them, and see what boxes the sorts go in. No larks, now. Here goes for the 'm's.'"

So saying, Mr. "Magog" proceeded to fill up one box with types of the letter "m," and another box some distance off with "a's," and another with "b's," and so on, till presently the lower of the two cases was nearly full. Reginald watched him with something like admiration, inwardly wondering if he would ever be able to find his way about this labyrinth of boxes, and strongly of opinion that only muffs like printers would think of arranging the alphabet in such an absurdly haphazard manner. The lower case being full up, Gedge meekly suggested that as he was yet several feet from his full size, they might as well lift the upper case down while it was being filled. Which done, the same process was repeated, only with more apparent regularity, and the case having been finally tilted up on the frame above the lower case, the operator turned round with a pleased expression, and said,

"What do you think of that?"

"Why, I think it's very ridiculous now to put the 'capital J' next to the 'capital I,'" said Reginald.

Gedge laughed.

"Go and tell Durfy that; he'd like to hear it."

Reginald, however, denied himself the pleasure of entertaining Mr. Durfy on this occasion, and occupied himself with picking up the types and inspecting them, and trying to learn the geography of his cases.

"Now," said "Magog," mounting his box and taking his composing-stick in his hand. "Keep your eye on me, young fellow, and you'll know all about it."

And he proceeded to "set up" a paragraph for the newspaper from a manuscript in front of him at a speed which bewildered Reginald and baffled any

attempt on his part to follow the movements of the operator's hand among the boxes. He watched for several minutes in silence until Gedge, considering he had exhibited his agility sufficiently, halted in his work, and with a passing shade across his face turned to his companion, and said,

"I say, isn't this a beastly place?"

There was something in his voice and manner which struck Reginald. It was unlike a common workman, and still more unlike a boy of Gedge's size and age.

"It is beastly," he said.

"I'm awfully sorry for you, you know," continued Gedge, in a half-whisper, and going on with his work at the same time, "because I guess it's not what you're used to."

"I'm not used to it," said Reginald.

"Nor was I when I came. My old screw of an uncle took it into his head to apprentice me here because he'd been an apprentice once and didn't see why I should start higher up the ladder than he did. Are you an apprentice?"

"No, not that I know of," said Reginald, not knowing exactly what he was.

"Lucky beggar! I'm booked here for nobody knows how much longer. I'd have cut it long ago if I could. I say, what's your name?"

"Cruden."

"Well, Cruden, I'm precious glad you've turned up. It'll make all the difference to me. I was getting as big a cad as any of those fellows there, for you're bound to be sociable. But you're a nicer sort, and it's a good job for me, I can tell you."

Apart from the flattery of these words, there was a touch of earnestness in the boy's voice which struck a sympathetic chord in Reginald's nature and drew him mysteriously to this new hour-old acquaintance. He told him of his own hard fortunes, and by what means he had come down to his present position. Gedge listened to it all eagerly.

"Were you really captain of the Fifth at your school?" said he, almost reverentially. "I say! what an awful drop this must be! You must feel as if you'd sooner be dead!"

"I do sometimes," said Reginald.

"I know I would," replied Gedge, solemnly, "if I was you. Was that other fellow your brother, then?"

"Yes."

Gedge mused a bit, and then laughed quietly.

"How beautifully you two shut up Barber between you just now," he said; "it's the first snub he's had since I've been here, and all the fellows swear by him. I say, Cruden, it's a merciful thing for me you've come. I was bound to go to the dogs if I'd gone on as I was much longer."

Reginald brightened. It pleased him just now to think any one was glad to see him, and the spontaneous way in which this boy had come under his wing won him over completely.

"We must manage to stick together," he said. "Horace, you know, is working in another part of the office. It's awfully hard lines, for we set our minds on being together. But it can't be helped; and I'm glad, any way, you're here, young un."

The young un beamed gratefully by way of response.

The paragraph by this time was nearly set up, and the conversation was inter-

rupted by the critical operation of lifting the "matter" from the stick and transferring it to a "galley," a feat which the experienced "Magog" accomplished very deftly, and greatly to the amazement of his companion. Just as it was over, and Reginald was laughingly hoping he would not soon be expected to arrive at such a pitch of dexterity, Mr. Durfy walked up.

"So that's what you call doing your work, is it? playing the fool and getting in another man's way. Is that all you've done?"

Reginald glared at him, and answered, "I'm not playing the fool."

"Hold your tongue and don't answer me, you miserable puppy. Let me see what you have done."

"I've been learning the boxes in the case," said Reginald.

Mr. Durfy sneered.

"You have, have you? That's what you've been doing the last hour, I suppose. Since you've been so industrious, pick me out a lower-case 'x,' do you hear?"

Reginald made a vague dive at one of the boxes, but not the right one, for he produced a "z."

"Ah, I thought so," said Mr. Durfy, with a sneer that made Reginald long to cram the type into his mouth. "Now let's try a capital 'J.'"

As it happened, Reginald knew where the capital "J" was, but he made no attempt to reach it, and answered,

"If you want a capital 'J,' Mr. Durfy, you can help yourself."

"Magog" nearly jumped out of his skin as he heard this audacious reply, and scarcely ventured to look round to notice the effect of it on Mr. Durfy. The effect was on the whole not bad. For a moment the overseer was dumb-founded and could not speak. But a glance at the resolute pale boy in front of him checked him in his impulse to use some other retort but the tongue. As soon as words came he snarled,

"Ho! is it that you mean, my beauty? All right, we'll see who's master here; and if I am, I'm sorry for you."

And he turned on his heel and went.

"You've done it now," said "Magog," in an agitated whisper—"done it clean."

"Done what?" asked Reginald.

"Done it with Durfy. He will make it hot for you, and no mistake. Never mind, if the worst comes to the worst you can cut. But hold on as long as you can. He'll make you go some time or other."

"He won't make me go till I choose," replied Reginald. "I'll stick here to dis-appoint him, if I do nothing else."

The reader may have made up his mind already that Reginald was a fool. I'm afraid he was. But do not judge him harshly yet, for his troubles are only beginning.

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

*Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,**Author of "Harold, the Boy Earl," etc.*

CHAPTER XVIII.—THE KATMIEWSKIE TSCHAST.

Moscow is divided into a certain number of districts, to each of which belongs a police-station, called the *tschast*. This division is also called the *tschast*, and is divided into certain subdivisions called *qvarvals*.

The police-captain commanding a *qvarval* is called a *qvarvalnik*, and his duties are to see that the passports of all the inhabitants of his *qvarval* are in due order, that the police-soldiers are duly posted, that the *dvorniks* from the various houses report the arrival and departure of all lodgers, servants, and guests in his district.

The *qvarvalnik* generally has a little house in some convenient part of his *qvarval*, but when that *qvarval* is that in which the house of the *tschast* is situated, his lodging is in the house, which contains the dwellings of many of the more than half military civil authorities. Here are the headquarters of the *posjarniks*, or firemen, with all the host of engines, fire-escapes, pumps, long ladders, vans for the firemen, and so forth. Here are the barracks of the police-soldiers as well as of the firemen, and the stables for all the police horses and those of the fire-brigade as well.

We have already described the quarters inhabited by the gallant Captain Malutin in the grand composite house forming the Katmiewskie Tschast, and we left him in the company of our little hero discussing the hopes, fears, and adventures of the latter. The officer became more and more convinced of the truth of Ivan's assertions and more and more delighted with the anticipations of a grand reward. But what to do with the boy for the moment was a difficulty.

He had a son of his own of about Ivan's size, who was a pupil in the Second Gymnasium, and was on a visit to a friend's house at the other extremity of Moscow with permission to remain there the night and the next day, which was a "*prasadnik*," or grand holiday. Malutin therefore advised Ivan, after partaking of some excellent tea with various kinds of cold viands—bread, butter, sardines, and cold meat—quietly to undress, go to bed, and get to sleep as soon as he could, and in the morning to assume the habiliments of the captain's son Serge.

The plan met with Ivan's perfect approbation, and, being half dead with fatigue and excitement, he most gladly accepted the offer of a bed on the sofa in Egor Sergevitch's study. But before undressing—if taking off the red calico shirt and the wretched trousers can be dignified by that term—Ivan "pitched into" the viands before him in splendid style, and even brought a smile to the calm, melancholy countenance of the captain himself. At last he was fairly beaten and declared himself ready for bed.

By this time the handmaiden came home, and at her master's command made up the bed on the sofa, and in a shorter

space of time than we can very well imagine they had Ivan fast asleep and snoring most melodiously.

Captain Malutin walked up and down in his oddly furnished lodgings until two o'clock in the morning, when a violent pull was given to the bell of the *tschast*, because the great gates had long since been closed. The fireman sentry had long been fast asleep, so had the *dvornik*, but the police-soldier on duty was wakeful and speedily opened the wide gates. This prompt attendance pleased the ladies who were driving in, and they gave the driver five kopecks over his fare, which was not an ordinary act on the part of Madame Malutin.

She ascended the queer staircase, followed by her daughter, and the dim lamp, which hardly served to illumine the way, was not sufficient to allow the peculiarities of face, figure, and dress, remarkable in these two ladies, to be discerned by an ordinary spectator. They reached the landing where they found the door leading to their rooms open and the captain just coming forward with a little lamp.

"Captain Malutin!" exclaimed his better half, "how can you leave the door open that way, letting all the heat escape? It is certainly three degrees of cold to-night, and our rooms are never too warm!"

"My dear, I only hastened to keep you from waiting in the cold. Make haste in."

"Make haste in! What next? Do you think you are commanding some poor wretch of a *dvornik*? I shall walk in as I please!"

On entering the room in which Ivan had been regaled, Madame Malutin exclaimed,

"Oh! I see, when the cat's away the mice will play! So you have been enjoying yourself in my absence?"

"Yes, my dear, I have had the most extraordinary and mysterious visitor I ever had in my life, and there may be good times coming to us yet, according to our treatment of him, for I have him still here."

"Batuschka! Where? What is he? Let me see."

"He is in bed on my sofa-bedstead."

"Impossible! How could you do such a thing as put goodness knows whom to sleep on a bed of *ours*? I am astonished. You might have waited until I came home, at least! Let me see!"

The lady ran forward, and rushing into the room found Ivan comfortably snoring on the sofa. One arm was thrown carelessly over the quilt and disclosed the nocturnal garment of her son, which the mother's quick eye at once detected, as well as the wretchedly dirty and miserable *rubaschka*, or red shirt, which, with the still more wretched trousers, was lying on the floor.

"Are those the ordinary garments of the gentleman who is to make our for-

tune? I congratulate you, *General*!" (she always said this when particularly cross); "and when do you think the good times are coming? Ah! you have given your young benefactor the very night-shirt of your own son! Captain Malutin, what does it mean?"

"I can only beg as a favour," he replied to this outburst, "that you will allow this young gentleman whom I have rescued from worse than death to remain in undisturbed possession of the couch. As to Serge's nightshirt, I am confident that kindness to that little neglected child will more than repay you for any quantity of linen or anything else that may be in our power to give him. Come into this room and do not make a sound to wake him—I know what I am about and mean what I say."

Awed by a new manner in her husband's address, Madame Malutin followed him, uncertain whether to break out into open rebellion or to repress the feelings which prompted her to attack him. She was not a stupid woman, but constant disappointment had soured her disposition fearfully. She had not been taught *where* to look for help in need. All her prayers were passionate petitions to the picture of her patron saint (that hung in the corner of her bedroom next to that of her husband) for aid in worldly matters. She looked upon her husband as the source of all her sufferings, and although the patience with which he accepted his lot occasionally impressed her, her general attitude towards him was hostile.

He soon explained in a few words, and then flung himself down upon the sofa in the sitting-room. This sofa had no accommodations for sleepers, being (as all state sofas in Germany and in Russia invariably are) made like two stiff arm-chairs with a piece joined in between them to unite them into one piece of furniture, the left arm of one and the right arm of the other having been removed to permit of this.

Lying down on such an article of furniture is a difficult problem, and one which Captain Malutin would never have sought to solve. But he did not think about it, his thoughts were all concentrated on Ivan. He fully believed in him, for he had answered all his questions most satisfactorily. He determined, however, to apply to the First Gymnasium to be sure of what he was about, and then to have him well clad in the first instance before taking him to Smirnof or to Kakaroff.

He wanted to gain time so as to allow the reward, of which he stood grievously in need, to augment. To keep him where he was would gain time, and the reward might increase to any amount, but how could he account for detaining the boy after his clear and unquestionably true statement respecting his misfortune? His duty was clearly to take him home at once, and this was his interest too.

As one means of gaining time he resolved to order a suit of clothes, if he could get a tailor to trust him (a difficult task for a poor man in Moscow), for he could not take him home in the wretched garments in which he was clad when brought to the tschast. The day or two which must elapse before these things could be got ready, added to the prasdnik of to-morrow, would give him about a week, he thought, and this seemed ample time for him to

where Ivan lay tossing in the disturbed sleep of fever. The doctor felt his pulse and shook his head.

"He will want careful attention. He has taken a severe cold under circumstances probably of very great excitement. I shall just give him a saline draught, and beg you to keep his head cool. It may pass off with care, or it may, if he be neglected, take a very awkward turn. Is he related to you?"

ber the fearful sufferings of that fellow who was such a favourite with Skobeleff? I forget his name. He was captain of the second company. Surely you remember him?"

"You mean Abrazoff?"

"Of course; yes, that was his family name—I remember now. The case I shall never forget. Poor fellow, how he was cut to pieces!"

"Don't talk about it. Write the pre-

"The lady ran forward and rushed into the room."

turn round in, and for the reward offered to be increased.

Malutin rose early next morning and went out. In a very short time he returned, however, accompanied by the doctor. The doctor bowed to Madame Malutin, and complimented her on her early rising; then, turning to the captain, he observed,

"I must ask you to let me see the boy at once, for I have many calls to make, and my time is precious."

He led the way into the little room

"Not related at all, but he has come to me under circumstances of peculiar interest. I think I may venture to say that your attention will be well considered. He is not a poor boy."

"My dear Malutin, I never thought of fees. In your house every inmate has a sacred claim. I have not forgotten the Balkan and Plevna!"

"Don't talk nonsense; but, *apropos* of Plevna, you remember the carnage there. After that all human suffering seems mild and comfortable. Do you remem-

scription and take a glass of tea with us; you have taken none yet."

"No, thanks—no time. I'm off—good-bye. Adieu, ladies!" And he was gone.

Malutin sent Proscovia to the apothecary's shop attached to the "tschast," and during her absence Madame Malutin asked her husband to tell her more in detail how he had become possessed of the boy, and what was the reason of his saying that their fortunes might be greatly improved by his means.

"The boy is Ivan Dobroff, for whom so

large a reward was offered not long since by the great merchant Smirnoff, and my wish was to keep him until the reward offered should be considerable. I was in doubt how to do this, when this morning I found his head burning and his sleep unnatural. This at once gave me the idea of keeping him quiet until we are able to remove him in comfort to his friends. You see, the state in which he came to me, half naked, wretched, and miserable, gave me grounds to suspect his story. It is known all over Moscow that such a boy has been missing. How easy it is for any young street Arab to say that he is Ivan Dobroff! If it only procure him food and warmth for a day or two, that is always a considerable gain in that class of the community. The doctor says that he must be kept perfectly quiet. So that Sascha must not practise her music, and I shall send a man to the Barsoffs with the request that they will keep Serge for a few days. I don't want it talked about."

"The boy must be carefully tended," she said, "and I will do my best; but I think you should go to his friends and put them at their ease regarding him. Depend upon it, you will not lose in the end. Besides, there is this to consider—the boy has told you where he lives and all about himself, so that you have no excuse for not seeing Mr. Smirnoff."

"Your view is very just, but I can always say that the story was incredible, and that I believed it to be a lie to escape the charge of theft."

"Then the question would arise, How, imagining him to be a thief, you could have decided on bringing him home and treating him like a member of the family. Either you should have put him into a cell as a felon or taken him to Mr. Smirnoff. You had no right to bring him here, and I fear greatly that the good which might have arisen from the reward offered may be undone by this error in judgment."

"I do not think," he replied, "there is any danger in keeping him. Nobody believed his statements, and I was drawn to the child by some undefined attraction in his face that reminded me of times long past. I could not have told you yesterday whom he resembled, but I know now: it was Abrazoff. Do you not remember Abrazoff, formerly of the Preabrojenski Guard, but attached afterwards to us by Skobelev's own wish—'Because we were such brave fellows,' as he said, 'that we ought to have some guardsmen with us to show the guards the art of war.' Some say it was only to infuse new blood into the mess as we were getting rather sluggish from want of work. But would you believe it, the doctor mentioned Abrazoff this morning, and then I knew whom the boy resembled. He is as like him as possible, allowing for the difference between a man of thirty and a child of twelve. And so I have my story. A child is brought to me charged with theft; he tells a rambling tale which no one credits, but I am attracted by the striking likeness to an old comrade. I see that he is ill; I bring him home, call the doctor, ask you to tend him for the sake of my old friend; and when, in the course of a few days, good nursing and kind treatment have brought him round, I take him to the Loubiyanka and gain the increased reward."

"Well, Egor, you must know best. It

may be all as we hope in the near future, but I fancy the better policy would be to go to Smirnoff's now."

Malutin got up and paced the room nervously for some time. At last he said, "No; as I have brought him home, and he is really ill, I'll risk it. I am sure it is better so. But the moment when I find him well enough to speak of all these things I'll talk to him, and then I'll fetch Smirnoff. It would not do before."

When Ivan woke he was slightly delirious, but did not rave. He saw Sascha, whom he called Annie, and begged her to fetch him some cold water. This she did, and he seemed refreshed and altogether better after the draught. Madame Malutin he did not seem to see or notice. He sipped cold spring water from the hands of the girl, and talked to "Annie" very strangely and incoherently about monks and cannibals and cellars until Sascha grew rather scared. At last he fell asleep, and slept soundly until noon, at which time the doctor, according to his promise, arrived.

His examination of Ivan was satisfactory. He could not pronounce distinctly, but he did not think that there were any signs of typhoid fever or anything really very bad. He attributed the delirium to overwrought sensitiveness, and commanded absolute quiet. As he was leaving, Malutin arrived, and the doctor asked whether he had sent the letter requesting his friends to retain Serge still longer.

"Oh, yes, I sent off a budeschnik with a note first thing this morning."

"That's as it should be. If the boy grows worse we must send him to a hospital, but if within forty-eight hours there should be no change of that kind, or if there should be an improvement (as I hope there will), why, then it would be best to leave him here. Your ladies seem to have taken to him in the most marvellous way."

"Does he remind you of anybody, doctor?"

"There is a vague feeling in my mind of a family likeness to somebody, but for the life of me I cannot tell to whom."

"Then why did you feel reminded of Abrazoff this morning, eh?"

"Batuschka! you are a witch! Yes, that's it. If Abrazoff's son had lived he would have been as old as this little chap, and doubtless would have been like him. Only there's no accounting for these things. Sons are more often unlike their fathers than like them, while the resemblance comes out in another generation. But you are right. The boy unconsciously reminded me of Abrazoff, poor fellow!"

"Do you recollect what Skobelev used to call Abrazoff?"

"No. Oh, yes I do, though. He used to call him Dobrie Ivan" (i.e., Good John).

"What do you think that little chap told me his name was?"

"Can't imagine."

"Ivan Dobroff!"

"I say, Malutin, this is getting unpleasant. Serving in the police makes you too mysterious. I'm off."

And he was off, leaving the captain in a brown study. At last he was roused by his wife knocking at the door to know what the doctor had reported.

Some days passed over Ivan's head before the truth of the doctor's assertion became manifest. There was no malig-

nant fever to dread, no evidence of its existence. It was the ordinary feverish condition of a very severe cold, aggravated by overwrought sensitiveness. The tender care of the two ladies was rewarded by the rapid advance in health made by the boy. At last the day arrived when he could sit up and walk and talk. The idea of sending for the tailor had been given up. Poor Malutin did not much care to see him, to tell the truth, on account of a "small balance" against him. So, having provided for his son's stay at the house of the friends whom he was visiting when our hero arrived, he encased Ivan in an old suit of clothes which had belonged to Serge.

One day, being much stronger, Ivan was sitting with Sascha and her mother when the latter asked him who Annie was, about whom he had so often raved during his illness. So he told them all his adventures since his escape with the student from Maziellovo. He told them of the way in which he had been taken to Kupsk, and of his recovery by Colonel Masloff, and how he had run off to try "to find Annie who had been so good to him," how he had been entrapped into the den and stripped and dressed in the wretched rubashka and trousers and boots in which he had been brought to the tschast. "One thing," he said, in conclusion of his long story, "I am sure of, they have sent Annie and her father to Siberia. And another thing is this—I mean to get them back."

They both laughed at his boyish enthusiasm, but later, when the mother had gone out, Ivan opened out his plans more fully to the girl.

"You tell me where you keep your passport," he said, "and I will borrow it; or better make a bundle of some of your things instead of the old clothes, which I shall tell your father I mean to keep all my life in memory of him. I shall make up two bundles exactly alike, and leave the one with my old things for you to get rid of the best way you can, and you must get me a passport. If you will do this I will be ever so good, and I promise you to learn Latin and please Mr. Smirnoff in every possible way. I will tell him what good people you all are, and how you are almost as good as Annie. At least you are perhaps better—I mean I like you almost as much. Funny, isn't it, that two girls should have been so good to me? I shall begin to like girls better. Must be something in them, after all!"

After this long speech, Ivan paused. Sascha did not know what to say. She did not like to promise to aid him in a breach of the laws, and to connive at the escape of a prisoner. But she could not bear to disappoint the warm-hearted little fellow, and to wreck his hopes of serving one to whom he seemed to owe such a boundless debt of gratitude. She tried to gain time by saying, "I'll see about it."

"That won't do," said Ivan. "I must have this help. Look here! It isn't much to ask you for, is it?—a bundle of old clothes of last year and a bit of paper! That's all I want; and your father will have twenty thousand roubles for finding me!"

"Nonsense, Ivan!"

"Fact. Masloff got that, and he had no trouble with me at all, except the fun I had out of him in the railway car-

riage, and that was so little that it was not worth mentioning. Here I have had great care shown me. Your father found me a bundle of rags, and not many of them, sick, poor, and wretched, and now I am as happy as a rat in a corn-bin! Well, if the old colonel got twenty thousand roubles for me without any trouble on his part, your father ought to get forty thousand, at least. And then to refuse me the few old clothes 'in' after a bargain like that, I call downright mean. You are not the girl I took you for."

"I'll see what I can do."

"Won't do! I must have your promise to give me the things and the passport. I have the whole plan arranged, and when I bring back Annie you and she will be friends."

Seeing how his heart was set upon the matter she said,

"I will promise you the clothes, and I will promise to try to get the passport, but that is very difficult because they are kept by the police."

"Well, are you not in the police?"

She laughed and said, "Well, perhaps I have better chances of getting at those things than outsiders would have, but it is so difficult that I can only promise to try. Now tell me what shall you ask Mr. Smirnoff to let you do?"

"You won't tell?"

"No, I promise not to tell. You will ask him to let you what?"

"Serve in the cavalry."

A hearty laugh showed that this secret was not what the young lady had expected to hear. And Ivan was much offended at having the secret desire of his heart laughed at.

At this juncture Captain Malutin en-

tered the room, and, seeing his daughter so amused, began to ask questions about the cause of her mirth.

"Well," he said, "whatever you were laughing at, there must be some truth in what Ivan says about the reward. It seems that for some days a reward has been offered, but not publicly, to the police. It has been communicated to the head of each tschast in Moscow, but by some means the notice has not reached me. I was busy with many extra duties, and have not been to the head office yonder for a week at least. This is a week ago, and the people of my qvartal have never thought of betraying your safe keeping here! It is altogether miraculous! I must ask you in speaking to Mr. Smirnoff about the matter to dwell on two facts, namely, first, that your identity was not, at first, believed in by any of us at the qvartal; and, secondly, that I have been, as well as my wife, much occupied in attending upon you during your sickness."

"All right," said Ivan. "I will say anything and everything you like, only I want you to let me have a bundle of all the old clothes I have worn on this expedition! I want the rubaschka, the brukie, and the old boots, as well as what I have worn belonging to Serge."

"That reminds me," said Malutin, "you must have a respectable schuba, for the snow is beginning to fall—and, in fact, it is winter."

"How jolly! That is the time to travel. Horses, bells, sledges! How they go! How the snow crackles! How the yamschik bullies the cattle! Don't talk to me of railways; they are well enough for miserable people like the

English, who live in a fog, have no horses, and never see snow. I mean to buy a sledge with three black horses and snow-nets over them."

The details of the schuba and fur cap were all satisfactorily arranged. The tailor had heard of the reward from a sergeant who had read the notice in the office, and he was only too glad to have a chance of obliging one of the richest merchants in Moscow, and in a very short time everything was ready to Ivan's satisfaction. He contrived to whisper to Sascha that the representation he should make of his treatment in their house should depend entirely upon the punctual performance of his request to have the bundle of girls' clothes and the passport. She had not been idle, and had actually been able to obtain the document he required from a heap of papers on her father's desk, knowing that he could easily replace it. She had put this in an envelope for Ivan, and put it into his hand at parting. The bundle of his clothes as packed by Helena Petrovna had been removed, and one closely resembling it substituted.

There was a tender leavetaking between Ivan and the two ladies, who had begun to like him hugely; and in a very short time Ivan once more found himself in the grand house of Mr. Smirnoff.

"Come up into my room, captain," cried Ivan. "I want to show you that I spoke the truth about my civil paletôt and cap. There is the peg from which I took the mantle and kepi. Haloah, Yuri! Don't you know me?"

"Is it possible? Yes, it certainly is Ivan Dobroff; and here is Mr. Smirnoff!"

(To be continued.)

THE GOLD FISH.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER V.

THE excitement about who were going to share in the enjoyment of Edwin's birthday festivities was only finally allayed on Saturday morning, when the three boys, Harry, Dickey, and Hercules, alone appeared decked in their Sunday clothes. Admired by all, envied by most, for these were now among the influential of the Highfield boys, the trio waited for Edwin Aston after school, and accompanied him to the home of his spinster aunt. Full of spirits at the prospect of the holiday, they laughed and chaffed and experienced the keen delight of freedom.

Miss Davis received them at the door of her mansion with a smile of genial, open-hearted hospitality. With all her crotchets and vagaries, she was a most charming old lady when concerned in the entertainment of young people.

Edwin was delighted at his aunt's gracious reception of his friends. The luncheon was spread with substantial elegance, the table garnished with fair flowers and fruits. Mirth and good-humour flowed apace. The boys discussed their school doings, and never an ill omened word was spoken to mar the harmony of the feast. Miss Davis entered

with lively interest into the details of cricket matches, which she understood about as well as a tortoiseshell cat understands the merits of Dresden china. She followed them in the history of woodland rambles and bathing adventures. She affected horror at the mark of the adder's fangs on Harry's wrist. She laughed for the twentieth time over the ludicrous conduct of Cacus in the school-room.

Then after lunch was over they went and sat under the verandah to enjoy the cool western breezes that were wafted through clustering traceries of clematis and jessamine and honeysuckle and vine. Miss Davis issued orders to James to bring out a table, and on it was placed an imposing square parcel carefully concealed by paper. This was her birthday present to Edwin, and proved when unpacked to be a handsome "Compendium of Games," containing chess, backgammon, draughts, steeplechase, and a host of other games, all turned out in the highest class of workmanship, such as a boy cannot fail to admire. Edwin's delight knew no bounds. The boys examined every item of the contents of the box, and played a game of steeplechase

with all the zest that attends the use of a new toy, and were so engrossed in the exciting sport that they were loth to leave it when the sound of carriage wheels announced the arrival of the young ladies.

Then there were shy shakings of hands, and tongues that before had seemed incapable of ever growing tired became on a sudden slow of speech and awkward in utterance, and it needed the full force of Miss Davis's arts to dispel the shyness of the boys and the coyness of the girls. But that good lady was equal to the emergency. Croquet, La Grace, and battledore upon the lawn gradually prevailed to remove all embarrassment.

And when they were tired of these amusements it was time for tea; which repast, in honour of the auspicious occasion, was to take the form of a picnic under the beech-trees by the pond. It was to be a genuine picnic, with no nonsense about it—as much a picnic as if the guests were on the wild slopes of a Welsh mountain or among the banks and braes of bonnie Scotland.

Baskets of provisions were brought out upon the lawn, and the boys carried them down to a grassy slope near the pond,

where beech and elm trees overshadowed the ground. The young ladies bore the teapots and kettle and lighter articles of the furniture of the feast. Two of the softer sex laid the cloth and set out the delicacies in appetising array, while two were told off to gather sticks for the fire. These were Molly Stephenson and Louise Delamere. Hercules was squire to the latter upon this occasion, and showed her assiduous attentions. Kitty Brown, the blonde, and Edith Grey, the brunette, presided over the teapots, and a blazing fire was soon crackling and sputtering beneath a gipsy tripod of stakes. It was a period of thorough enjoyment to all concerned, not least so to Miss Davis, who seemed to live over again one of her own sunny birthdays in the days long ago of her childhood. The happiness of the children around her brought back memories of the past. To quote the beautiful words of Charles Dickens—which of you boys can tell me from where they come?—"The tear which starts unbidden to the eye, when the recollection of old times and the happiness of many years ago is suddenly recalled, stole down the old lady's face as she shook her head with a melancholy smile."

Merely a passing cloud to dim for a moment the sunny scene.

Tea could not last for ever, and some one suggested a row on the pond. The old punt was soon manned—a craft warranted, if needs were, to carry a brood of young elephants. Harry Dawson and jolly old Hercules rowed three or four of the girls up the deep and shallow reaches, where perch and tench lurked through the hot summer afternoons, as cool as cucumbers, enjoying life while weary masters and boys labour at lessons.

And now we are approaching the crisis of this tale.

"Oh, do let us fish!" cried Edith Grey. "May we, Miss Davis? We can put what we catch into the basin of the fountain."

(You think, my boy, that you can guess what's going to happen, don't you? Not exactly, though!)

"To be sure, my love," answered the kind old lady. "Edwin, dear, fetch the fishing-rods from the stables, and ask cook to make you some dough-paste. We will not use worms, it is so cruel."

The tackle was soon procured, and two of the girls began to angle. Mademoiselle Louise was not slow to capture a perch, which Hercules gallantly took off the hook for her, and got his hand well pricked by the back fin during the operation.

Then the young ladies declared that Miss Davis must come upon the water—a thing she had never dreamed of during all the years she had been at Chesterton House. A garden-chair was placed in the punt, and a chorus of silvery voices begged their kind hostess to embark. Edwin insisted on being captain of the vessel on that voyage. He declared he could not trust his aunt on the water alone. Miss Davis's nerves seemed inspired with supernatural strength that afternoon. "The old lady stuck at nothing," as Edwin expressed it when afterwards talking over the glorious birthday festivities with Harry Dawson.

She actually stepped into the punt and sat in the chair, and suffered herself to be rowed about; and when the oarsmen rested for awhile, and Edwin put a fishing-rod into his aunt's hand, it seemed to her the most natural thing in the world that she should hold it! Miss Davis fishing in a punt! Such a wonder had never been known! It was the first and last time she ever fished in all her life.

Miss Davis did not find her patience long taxed. See, the float bobs—ducks its white head—dives—furiously disappears. The fisherwoman nearly lets go the rod.

"Hold hard, aunt! don't give in! you've got something grand!"

Miss Davis holds hard with both hands. The hazel wand bends like a shepherd's crook! Crack! the top joint has sprung a leak—that's not quite the correct ex-

pression, but the excitement is so intense that we cannot stop to alter it. She grasps the line. She hauls it in hand over hand! She refuses all assistance! Victory is hers! There lies gasping and floundering at the bottom of the punt

THE GOLD FISH!

* * * *

All things must have an end.

The shadows of evening had lengthened. The sun had set. The cool calm holy twilight had followed. The guests at last were gone. Edwin and his aunt stood alone upon the lawn.

"Well, aunt, you have given me the best birthday I ever had. I do thank you with all my heart. And it was *you* who caught the gold fish after all!"

"Edwin, I must beg your pardon. I have misjudged you. In spite of your telling me you had not disobeyed me, I could not help having some misgivings about the disappearance of the fish. I think now it must have found its way into the pond down the overflow-pipe."

"You're right, aunt. I'll tell you all how it happened."

And the boy told the whole story, which need not be repeated here.

In his latter days the burly fish once more reigned supreme in the fountain basin, monarch of all he surveyed; and never again did he escape; for a piece of wire gauze was fastened over the mouth of the pipe. He may have sometimes sighed for the deeper waters and broader pastures of the pond, but, at any rate, he had little to complain of in his declining years, and continued as of yore to be his mistress's only animal pet.

And as for the question of cribbing and cheating, like many a similar misunderstanding, it was soon forgotten by all concerned; and, somehow, from that day forward, Edwin and his aunt seemed to understand each other better; and so, like the hero and heroine in the dear old children's stories, they lived happily ever afterwards.

(THE END.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER V.—"GOOD-BYE, SWEETHEART, GOOD-BYE."

IT was a glorious day, breezy, exhilarating. You would have said so had you been walking among the woods of Mount Edgumbe, that fringe the sea to the west of Plymouth Sound. The autumn tints were on the trees, the leaves came whirling down in showers; on some parts of the pathways they lay inches deep, and the bare-legged picturesque-looking children returning townwards with baskets laden with ripe, fat acorns danced among them and skipped among them, and laughed to hear them rustle, while high in the branches above dark-tailed squirrels squatted and swung, eyeing the children's baskets with envious glances.

A glorious day among the woods, and a glorious day anywhere you might roam in all the romantic country. But across the wilds of Dartmoor, had you been

making your way, you would have felt the full force of the breeze, and, had you been a sportsman, you hardly would have thought it so glorious there.

Then seaward had you looked you would have noticed that Neptune's lambs had come out to play, for the wind blew stiff and strong directly down Channel, and skippers of ships and craft of every kind beating havenwards with scanty canvas could scarce have said it was a glorious day at all. Yet they might have had worse weather, for the sky was blue overhead, and the few white clouds there were gave ample promise that, however stiff the breeze might be, it would be a steady one.

"A glorious day, sir," said Lieutenant Mildmay to his commander as they stood together on the quarter-deck of the *Theodora*.

The vessel lay at anchor in the harbour, the outermost ship, and some considerable distance astern of the Royal Adelaide, on which the admiral hoisted his flag.

The captain gave no direct answer just then. There was a frown on his not over-handsome face, so it was perhaps as well he did not speak at once.

He was looking at the stores with which the decks were littered, he was listening to the clang, clang, clang of the carpenters' hammers in the ward-room beneath their feet, he was sniffing with supercilious nostrils at the odour of fresh paint.

He gave one impatient glance around him at last, up at the sky, and out across the Sound to the Breakwater, then he took two or three rapid turns up and down the somewhat dirty deck, as lions

chafing at their thralldom do in their cages; then he stopped short, just where he had done before, but he did not look at his lieutenant as he replied,

"A glorious day! Was that what you said, Mr. Mildmay? Of course it is a glorious day, that is the worst of it. A glorious day, and we ought to be out in it instead of hanging here by the nose, like an old hulkus-culkus. A glorious day, indeed, and a glorious wind blowing right down Channel, and we ought to be feeling it, and half way across the bay by this time. But just look at the abominable mess we're in."

"Well, sir, I've been a bit short-handed for the last fortnight. If they won't send me more men from the dock-yard when I apply for them, what am I to do?"

And Lieutenant Mildmay smiled in a conciliatory kind of way. The smile did not move nor mollify the commander in the least.

"Yes, yes," he replied, curtly, and somewhat cruelly, "laugh away, laugh away. I can't afford to laugh."

He paused, then he stamped on the deck so loudly that one blue-jacket at work beside the windlass looked round, and, noticing the dark look on the captain's face, winked to his companion.

"Ain't he in a flame, Bill?" he said.

"He's a hot un, I guess," said Bill. "But heave round."

"I used to be considered a smart officer," continued Captain Blunderbore, "but now, sir, under the circumstances, I could positively excuse Admiral Fuzz-gig if he tried us by court of inquiry. I really could, sir."

"Mr. Steele joined yet?" he added.

"No, sir; he will to-day, I believe."

"There again, you see—there again; only that useless young sprat of a McLeod to help the stores on board."

"Yonder he comes now, sir," said Mr. Mildmay; "and I really think the boy does all he can."

For the first time since they had commenced speaking the captain looked his

lieutenant in the face; and there was a curl on his lips, half sneer, half smile, as he said,

"I've been shipmate with you before, Mr. Mildmay."

"Yes, you were," replied Mr. Mildmay.

"We were in the gunroom together for a year in the old Duncan. I was then mate, and you were middy."

"I did not refer to that time," the

bows, a few red-coated marines crouching down wherever they can find room; the ship's steward, the messman, and two other marines in the stern-sheets, with the coxain perched up right aft, tiller in hand, while he himself has barely standing-room.

A glorious day indeed! He is so tired now; he has had nothing to eat since morning, and his face looks pale as he lifts his cap to wipe away the perspiration with a handkerchief which—pardon the comparison—looks absurdly like a bicycle rag.

A glorious day! It has been the hardest day, or one of the hardest days, ever he remembers. In that cutter he has been, off and on, 'twixt ship and shore, since one bell—half-past eight—in the forenoon watch; and now it has just gone one bell in the first dog watch from every slip in the harbour—a perfect Babel of bells. He might have found time to dine, but he only took a standing bite, for there was nobody to take his place, and watches have not yet been set.

On shore he has had constant irritation. The working parties have been on better terms with themselves to-day than usual; which means that they have been more full of talk and joke, and chaff and song, and consequently not so full of work, so he has been worrying himself keeping them at it. He

knows all their names; he has been down here ten days, and a hundred times at least this day has he had to order "Jones" to keep silence, or "Harris" to go on hauling, or "Jack Brown" to keep his eyes at his work. Jones, Harris, or Jack Brown never failed to reply respectfully,

"Ay, ay, sir."

But that made little difference to the case in point, for what cared they for Middy McLeod? Well, he might report them, but well they knew he would do nothing of the sort.

He was only a mite of a middy even yet. Smaller even than he ought to

"Good-bye, sweetheart, good-bye."

captain said, interrupting him. "Call away the gig," he added.

A glorious day for those on shore, among the woods or on the moors; a glorious day for those in ships in harbour, whose officers had little to do but walk on white, clean decks, or gaze listlessly overboard and watch the sea or the flocks of busy gulls that screamed around or floated on the water like miniature frigates. Hardly a glorious day, however, for Colin McLeod, who is now coming towards the Theodora in the biggest cutter, laden to the very gunwale with stores for the wardroom and gunroom, an extra hand or two in the

have been for his years ; small, but good-looking and smart withal, and strong as well. A mite of a middy, but a muscular mite, for all that.

In some streets adjoining the corner where his boats landed were shops with viands in the shape of rounds of roast beef, boiled hams stuck all over with cloves, and sausages swimming in steaming brown gravy. If it had not been for his uniform Colin would have rushed into one of these tempting emporiums and enjoyed what schoolboys call a "good tuck-in."

But the sorrows of hunger and hard work were not all that Colin had had to endure that day. He had had to stand a good deal of chaff from that good-natured but somewhat thoughtless animal the British public. They spoke at him, about him, or directly to him, but never unkindly.

"I say, Dick," said one immensity of a shore-porter, "he bees a little un, bean't he?"

"You shut up, 'Arry," was Dick's reply. "That's one of the bold defenders of our native land."

Passing a greengrocer's shop, where two women stood bargaining—

"Haven't you left your mammy too soon, dear?" said one.

"Let the child alone; he'll grow," said the other.

"And so will his sword," retorted the first speaker.

The men did not hesitate to titter at these remarks, though Colin grew scarlet with vexation.

Perhaps Phelim McKoy, an Irish blue-jacket, noticed the confusion of his officer, and it was to comfort him he said,

"Sorra a bit o' notice I'd take ov it, sorr. There's the makings av a man about, sorr, sure enough."

Well, it was vexing that when Colin was all ready to go off with the last boat two of his crew should be missing.

He went to find them, and did. They begged his pardon—said it was the first glass of beer they'd had to-day, and in triumph he marched them to the steps, only to find two more had gone. He found them next. They had only just run up, they said, for a "bit o' baccy," but when Colin got back the second time and found the other two had gone, then he lost his temper.

"Jump in, steward," he said, "we'll go off without them."

He was twenty yards from the shore when the truants returned.

Silly midshipman that he was. He ought to have gone right away off, and those two men would never have put foot on English ground again for years and years to come—if ever. But he had not the heart.

He is going off with the last boat, then, pale, tired, and worn. Now he meets the captain's gig swinging shorewards with the speed of a Thames racer.

Then oars have to be tossed, and Colin lifts his cap.

The only notice the man of four stripes takes of the salute is to draw the forefinger of one hand rapidly across his nose—a long hooked one—as if brushing a midge off.

The wind caught the bows and swept the cutter some way round till she seemed about to start down Channel, and the captain was heard by his own

crew to growl out the word "Awkward!"

But matters were soon put to rights, and at long last they are by the port-side, and Colin, all his feeling of fatigue departing in a moment, runs nimbly up the rope ladder and goes to report.

Down below he went next to have a wash, put on another jacket, and swallow some tea that his servant brought him.

Who do you think that servant was? You guess rightly, it was Duncan, the keeper's boy, but quite a soldier now, and as quiet and respectful to his master as if he had never played "dambrod" with him side by side in the old pine wood.

Captain Peter had managed this transition to the satisfaction and comfort of all concerned.

"Oh! Duncan," said Colin, when he was at length dressed and ready to go on deck, "I've been so hungry all day, but I don't feel it a bit now."

"Have you really, sir?" was the reply.

"Look here, Duncan," said Colin, in a low voice. "You are right to call me 'sir.' Let us begin as we are to go on. You are right to call me 'sir' on all service matters, on or off duty, but when we are quite alone, and it isn't a matter of service, let us be the same to each other we always used to be. Be thou my foster-brother as of old. Do not let the recollections of our boyhood's days fade quite away, Duncan. I would have every scene in our native glen—forest and moorland, lake and stream, the green woods and purple hills—to dwell in memory for ever, and wherever we go, as bright and clear as a painting on glass."

Duncan did not reply. He busied himself arranging his foster-brother's sea-chest. His heart was too full to reply, and Colin knew it, and said nothing more.

When Middy McLeod went on deck again a very joyful surprise awaited him. Quentin Steele was there!

There was an almost mischievous smile on his handsome face as he advanced to meet Colin with hand extended.

"Why, Quentin! My old sea-dad! You here! You've come to say good-bye?"

"Not yet a little. I've just joined the ship. We sail together."

"We do! And you never wrote to tell me!"

"No, old man, that was my joke. I wanted to give you a startling surprise."

"Well, it is a pleasant one. I'm as happy as happy now."

Arm-in-arm the two strolled away forward together, and were soon in deep confab under the fore rigging.

So interested were they indeed in their conversation that they did not hear a light springy footstep close behind them. They both started and looked up, for a hand was laid on the shoulder of each, and there, towering above them, for he was a tall and squarely-built man, stood the first lieutenant. He was all the sailor, not only in build, but in the way he wore his dress. His frock-coat was open, his waistcoat a white one, his cap well up over the brow, but not over the hair, his shirtfront and cuffs were faultless, and diamonds glittered in them, but the neck was very loose.

Poor Mildmay! he was a man who had positively turned grey in the service, waiting and waiting for the promotion that never came. He had no interest,

save the interest of honesty, bravery, and strict attention to duty; his very strictness in the matter of duty had on more than one occasion offended people in high places. Be this as it may, the fact remained that Mildmay continued a lieutenant at forty-two, when he ought to have been a post-captain.

Mildmay had a very handsome face, a shapely somewhat aquiline nose, a high white brow, thin mobile lips, and brown eyes, the expression of which was at times almost womanly in their serenity. He shaved all his face and permitted his hair to grow long—locks, in fact, that waved behind his ears and neck.

He looked very engaging when he smiled, and very sincere, but sword in hand on the day of battle Irving himself never showed a fiercer face.

Have you got him in your mind's eye, reader? I hope you have. The sketch is no fancy one—he was the writer's sea-dad.

"I'm glad to notice," he said, "that you two young gentlemen are old acquaintances. I want you both to come and dine with me."

"With pleasure, sir," said Colin, "but when?"

"To-night. Now. The first bugle has gone. The second will go in twenty minutes. Go and get ready."

Both Quentin and Colin were somewhat shy at first in the ward room. It was a very small dinner-party, however, for the officers had not all joined. Mildmay very soon set them at ease. He was all attention to their every want, though he did not seem to force attention on his young guests. It was evident he not only understood boys but loved them. He kept them laughing all the evening with his whimsical talk and his strange stories, and when he dismissed them at last both averred that they could not remember ever spending so pleasant an evening before either ashore or afloat.

Another week of hard work to all on board, then things began to grow ship-shape; the decks were cleared, the stores were stowed, painters and carpenters had done their work, the officers had all joined, and the good ship had left her moorings, slipped away out, and anchored—all ready to sail—between the Hoe and the Breakwater.

There they lay waiting for orders to leave.

They came at last, and steam was got up, and boats got in. Quite a fleet of small craft, however, surrounded her. In them was the blue-jacket's sweetheart, the blue-jacket's wife, the blue-jacket's mother, and sister, and children, and many were the tear-bedewed handkerchiefs waved after the brave Theodora as she moved slowly away at last.

And from over the water came the plaintive notes from the flagship's band of that sweet old song,

"Good-bye, sweetheart, good-bye."

(To be continued.)

* * * The Collecting Cards for the "Boy's Own" Gordon Memorial are now ready. Every reader of the B. O. P. should endeavour to do something to help on the good work.

OUR PRIZE COMPETITION.

(SEVENTH SERIES.)

Writing Competition.

(Continued from page 495.)

BEFORE dismissing this Competition for the next—"Illumination"—it may be well to make one or two remarks by way of information, advice, or warning. First let us mention that we have accepted all the "Versions" sent in, as there seemed to be some doubt in the minds of competitors as to the one it was intended should be used. Thus we received and accepted copies from the Bible, the Prayer-book, and the Scotch Psalters, as well as Welsh, French, and other versions. But here we made our stand. *Incorrect* copies, of whatever version, were at once rejected, errors in spelling being in many cases fatal, and omitted or duplicated words and sentences accounting for other failures where the handwriting itself was of a high class. We may state, too, that the copies of the Psalm sent in from Board and other schools have been conspicuously marked by the number of words omitted and wrongly spelt, etc. How is this? Once reading over after completion ought to have been sufficient to reveal the errors and omissions. The actual *writing* from some of our great public schools was about the worst received.

Turning now to the other side, we must congratulate our friends both on the number and quality of the papers sent in. The thou-

sands received by us—there were nearly ten thousand in all—prove the popularity of the subject; and in the case of some of the productions it would be very difficult indeed to suggest any improvements, so near are they to perfection in their several styles of penmanship. Regard has of course been paid to national as well as other differences in writing, that all might have a fair and equal chance. We should like to speak a special word of encouragement to those who have been handicapped by natural difficulties—to those lads, for instance, who have to work at manual labour from 6 a.m. to 6 p.m., and whose only opportunity of learning to write is that provided at the night school or some such useful institution. To such we would say, Do not be depressed because you have not been able to win a prize or certificate, for there are many who have had almost every advantage, so far as one could judge, who have failed quite as much as you, and you have certainly reaped benefit from the effort you have made. Some competitors have had peculiar odds against them. Thus one writes: "I lost my right arm 'stocking' the passenger train between Edinburgh and Dundee on 18th May, 1884." We are agreeably surprised at the style of the writing learned in

the short time that has elapsed since the accident, and very heartily wish our friend well.

Then a mother writes: "The specimen of writing sent herewith is penned *without hands* or even feet to aid in the construction of the letters. A living artist, I am told, achieves admirable work holding his brushes betwixt his toes. My poor dear boy holds his pen between his stumps, being possessed of only a portion of each forearm and of each thigh—like Mr. Kavanagh, late member for Wicklow. Competing for the prize is entirely his own conception." Some at least of our readers may remember seeing in one of the picture galleries of Belgium, as we did so recently as last autumn, an artist who copies the Masters, deftly plying his brush with his toes, and heartily shaking the hands of friends in the same way. We send our greetings to our competitor, with our hearty congratulations on the attempt he has made to win laurels in this competition—and, indeed, to all such as have had to face unusual difficulties in their work. These may meet even defeat cheerfully, in the consciousness of having done their best though confronted with obstacles that would have deterred many another.

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

IV.—THE FLY-ROD—HOW TO USE IT.

IN the use of the rod the point to be aimed at is not the length one can throw a line, but the precision with which the bait can be put on the water and the general neatness and lightness of such operation, so that the fish may not be scared, as will ensue without fail on clear water if the angler be clumsy. Not that it is undesirable to cultivate long throwing; on the contrary, he who can command a long line will under some circumstances command fish which his less muscular brethren would be unable to reach.

Cotton, in his contribution to the "Complete Angler," says very truly, "The length of line is a mighty advantage to the fishing at a distance, and to fish *fine and far off* is the first and principal rule for trout angling;" and Professor Rennie adds in a footnote, "An artist may easily throw twelve yards of line with one hand, and with two he may easily throw eighteen." I wonder what he would say to the throwing at Hendon in June last at the "Anglers' Tournament" got up by Mr. R. B. Marston, where Mr. Mallock, of Perth, threw thirty-two yards with a single-handed fly-rod!

Let it be understood, then, that the style and precision of throwing the fly is the first consideration, and that distance is the next. To be a master fly-fisherman, as I have elsewhere insisted, the tyro must begin young and keep up his practice unremittingly. It is the same with cricket and all other sports requiring manual skill and dexterity; the muscles must be taught to act in a certain way continuously, so that a habit is formed, and then almost independently of personal volition they operate towards a desired end without interference from the voluntary powers. In fact, in most exertions, if we pause to consider and frame them at each performance the chances are that nervousness

—i.e., excessive care—steps in and frustrates the good throw, or the high jump, or the finished "drive" at cricket. If, however, correct habits are formed—and practice forms them only—after a time, great or little, according to the facility of the pupil, the movement becomes a part of the recognised performances of the arms, and demands much less thought and guidance, just as my pen at this moment of writing trips over the paper, apparently framing words and sentences of its own will, whilst I am thinking the thoughts it puts down.

I hope you have caught my meaning, and, if not, let me advise you to go through the last paragraph again. If, however, you understand what I desired to convey, the next step is to set about the actual operation of casting a fly.

First let us throw the line from a single-handed fly-rod. Now at the commencement it is not necessary for you to throw the line on water. I rather advise you to select a broad expanse of lawn or field where the grass is short, and there seek to get your hand in. It is quite right to attach an artificial fly, but in order to save the "flicking off," which when you begin your lessons will exhaust a dozen flies in as many minutes, it is well to roll a piece of worsted round the hook. Having done this, it is time to make your first throw.

To do this, take the rod just above the reel with the right hand firmly, the thumb lying uppermost along the rod, pull out with the left hand a good length of line from the reel, then with a backward movement of the rod's point, keeping the elbow in to the side, urge the line behind you; then bring it forward, not too swiftly, but with an even rapid motion, till the rod's point is at about three to five feet from the ground. Your fly ought

to have fallen in a straight line before you if this movement is properly performed.

If you wish for more line from the reel now is the time, before recovering, to release some with the left hand from the reel or winch. This do, and as you lift the fly from the grass to send it behind you just give an extra rate of speed to it that the slack line may pass through the rings. Get some one to give you an illustration of how this should be performed, and then with the above description no false understanding can result. Continue to practise on a lawn with first a short line, gradually lengthening it as you proceed until the full limit of your skill and strength is reached, and until you lose the unpleasant popping sound which if your fly were not protected by the worsted would certainly proclaim that it had departed or been "flicked off."

Having managed to throw a line without difficulty in such a way that it faces straight on the water, the fly being at the end of the cast, it next becomes necessary to cultivate precision. To this end I still advise lawn practice for some time. A sheet of white paper makes a good target, and as hitherto you have naturally thrown *with* the wind, it is very advisable to practise throwing sideways, and under and even against the breeze, making your paper the supposed fish to which you wish to present your lure. A heavy line is necessary for these latter manoeuvres, and, indeed, I do not myself favour a very light line at all. Having as you think succeeded in fairly mastering the rudiments of casting, you may now hope to take to the water with a chance of succeeding in getting a trout or two without frightening more than two-thirds of what you succeed in getting to rise at you, and if you have persistently practised you may also hope to escape the good-natured but slightly contemptuous laughter of the expert

angler which usually greets the uninitiated and clumsy fly-fisher.

Of course, your motto for a long time yet is, "Practice, practice, practice!" and especially is this necessary when your advancement is sufficient to warrant your taking to the water. If no fish be rising, take imaginary spots for your targets, and do not leave off till you can reach them satisfactorily—*i.e.*, without splash or doubling of the line. If you cannot do this you are not fit to throw over a rising fish.

"But," you will be asking, "when I can do what you say, and see a fish rising, how is it to be fished for?" Verily, a question better replied to by the water than on paper. Half an ounce of practice is worth a bushel of mere theory—though, mind you, if one's theory is right the practice cannot be wrong, for one follows on the other as the night the day. However, these simple rules will aid the intelligent learner.

First let us suppose the fish is rising in open stream. The question primarily occurs, "What at?" Now herein comes your entomological knowledge. Watch carefully, and see if possible the exact fly that is coming down, and if you cannot quite discern the form pay attention to the *size* and *colour*. These are all-important in fly-fishing and fly-making. "But," you say, "I can distinguish it; it is an olive dun." Well and good. You thereupon attach an olive dun. What next? Well, I suppose you have not been stupid enough to get near your fish from above—for a trout always lies with head up stream. No, he lies ten yards above *you*, and is sucking in the fast-floating flies with quiet but unmitigable enjoyment.

Is your fly attached? Yes! Good! Now draw out some line as I told you before, and get a length in free working order by throwing a few times *in air*. This you will have learnt to do on the grass, or if you have not you ought to have done so after what I told you. Well, you have now, say, a dozen yards of line in working order, and you are keeping it, by alternate movements backwards and forwards, suspended in air. Your object is to drop the fly about three feet above the fish, and let it float over just as you saw the other flies do.

Can you do it? Try. Well done! But the line was not quite straight, and the stream dragged it ever so slightly, and this is enough to startle your fish. Oh, there is another rising fish just above to the right! Try him. Gently your line on a gentle breeze at your back sails through the air, and the fly just falls in front of the jewel-like eyes of *Salmo fario*. He rises, takes it. Mount your rod, don't strike; see you have him. Keep the top well up, and draw in what line is necessary with your left hand. Bring him down stream, gradually increasing your tension on his mouth. So! Into the bank with head slightly raised. Take out your landing-net from the band of your creel, and bring it round over his tail, and then lift. Gently again! See, you have a pound trout! That is a result of *up-stream dry fly-fishing*.

Why "dry" fly? you perhaps ask. Ah! I find that I have forgotten to explain that peculiarity of modern fly-fishing, so, with

your permission, fair brother anglers, let me digress somewhat and expound its "art and mystery." To do this effectually I must call your attention to a representative clear—or chalk, almost synonymous terms in trout-fishing—stream well known as the Itchen, in Hampshire. Here the water is so clear and gin-like that the wonder is that the fish take an artificial fly at all. But take the fly they do—and that to a pretty tune sometimes! What do you think of 287 brace of trout in one calendar month (Sundays, of course, excepted) caught by one rod? But this was some years ago. Even now, however, eight and ten brace of fish a day are not by any means uncommon.

But to return. Forty years ago the trout of the Itchen would take the fly if thrown on the water to some extent anyhow. They cared not for the "dry" fly, not they, but were glad to get a fly of any sort. Now things on most such streams are vastly different. Of course the fly by its being flicked in and out and on and off the water becomes soddened with wet, and does not float owing to the weight of the iron hook. Trout nowadays will have none of this, and a device is necessary to dry it. This consists in "flicking" it backwards and forwards in air several

times before delivering it to the rising fish. Some anglers dip the fly as soon as it is attached in paraffin oil so as to destroy the capillary attraction. It is a very good dodge, but has this unfortunate tendency—it loosens the binding of the fly, which is in nine cases out of ten waxed with a wax soluble in paraffin. The result therefore is that before you can call out Jack Robinson after hooking a fish, the said fish has taken his hook (or yours) in disgust, leaving you wiser—but not better pleased. This, therefore, is what is termed dry fly-fishing.

By-the-by, only one fly is used, and one of the chief excellencies of a good "dry"-fly angler is his ability to keep his eye on the fly as it falls. He never casts at comparative random, but selects his fish and studiously puts the lure before it with intent in all he does. If you can fish and kill on such a stream as the Itchen or the Dove, or the Test or the Gade in Hertfordshire, you can consider you have graduated, and all other tackle for trout will presently reveal itself without difficulty. I have purposely given you your hardest lesson first, whilst your enthusiasm is strong.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE ROTHESAY CASTLE.

TO the west of Penmon in Anglesey is Llanalgo, where, as told in our part for March, the Royal Charter was wrecked; to the east of it, about a mile and a half towards the Carnarvon coast, is the Dutchman's Bank, whereon a good many years ago there occurred a wreck which caused, if possible, even more consternation than that we have

described. The loss of the *Rothesay Castle* could not well be omitted from any group of the horrors of the sea, for it furnishes such a striking example of that kind of disaster which is due entirely to stupidity and bad management.

She was wrecked in 1831. She was then eighteen years old—a paddle steamer that

had originally been built as a river boat, with upper timbers only four inches thick. After trying to trade across the Irish Channel—when her men left her for unseaworthiness—she had been placed to run as a pleasure steamer between Liverpool and Beaumaris, to which latter place she was bound when she ended her career on the

Dutchman. She left St. George's Pier, Liverpool, at eleven in the morning of the 17th of August. There were one hundred and fifty passengers on board, pleasure-

sengers, set-to rolling and pitching alarmingly. With the wind and sea against her she did but little good, and at three o'clock in the afternoon, after four hours' steaming,

and the boat drove labouring on. All that was done with regard to her management was—to collect the fares!

The sun set, and the storm grew, and the

Wreck of the "Rothesay Castle."

seekers of all classes, some of whom had come in parties from a distance for the trip. As she left the pier her band struck up a lively air, the bright sun shone out cheerily, and all promised well.

As she made her way slowly down the Mersey the clouds began to bank, and when she passed New Brighton the sea grew angry, and the old boat, heavily crowded with pas-

she had only reached the Floating Light, fifteen miles from Liverpool.

As the weather threatened to grow worse, many of the passengers appealed to the captain to put back, but that individual having expressed his opinion that there was "a great deal of fear and very little danger," proceeded below to refresh himself. The "pleasant trip" was consequently continued,

steamer ploughed on in the teeth of the wind, and her hapless passengers were almost drowned with the spray that came dashing on board of her. Creaking and groaning, with her paddles alternately out of water, she rolled slowly on until at midnight she entered the Menai Straits and stopped dead on the Dutchman's Bank. The confusion may be imagined. There was no gun to

signal with, no light or lantern, and no oars in the boat which soon broke adrift. There was only one pump, and that was soon choked by the ashes from the engine-room. The water slowly rose below, for there was nothing to bale it out with. There was not even a bucket to be found. The bell was rung so furiously that the clapper broke, and it had to be struck with a stone. The bell was heard, but in the darkness of the night the spot whence the sound came could not be discovered. The long sandy spot called the Dutchman's Bank runs out into the centre of the channel, and at the spot where the vessel grounded was about a mile and a half from Penmon. Pilots were there ready to go out on receiving the signal; but no signal was made. There was not even a blue-light to give it.

For fourteen or fifteen times the Rothesay Castle bumped on to the sand before she came to her final rest. At the captain's orders the passengers ran together aft so as to shift the weight, but the manœuvre was useless. He then tried to ease her by running the passengers forward, which alike proved useless. And then he simply gave it up as a bad job—and did nothing.

As the boat settled the seas came sweeping over her. Out of the passengers and crew only twenty were saved. The scene was terrible. Let one of the survivors tell his story.

"My wife and some friends came to me and asked if I thought we should be lost. I thought we should, and they proposed going to prayer for the short time we had to live. We all went to prayer, myself and wife in particular, and when we got from our knees I saw four men getting upon the mast, and beginning to fasten themselves to it. I told my wife I would look out for a better situation for us; I took her towards the windlass, and began to fasten a rope to the frame where the bell hung; and when I had got the rope

made fast, and looked back for my wife, she had again joined our friends near to the place at which we knelt down. A great wave almost took me overboard, but I held by the rope; there came a second, and a third wave, before I could see my wife again; and when I looked—they were all gone."

And with them many more. And throughout that night and early morning the steamer slowly broke to pieces, and the waves bit by bit devoured their prey. No attempt was made to launch a raft, or even to cheer the people with hopes of safety. They remained fast and helpless on the sand, until one after another they were all washed away. The bank is dry at low water. One of the passengers who knew the neighbourhood opened his umbrella, used it as a life buoy, floated for about half a mile, and then walked ashore. And although this man well knew that he could do this, and deliberately started with the intention of doing it, yet he never said a word to his fellow-passengers as to their nearness to safety, and left them to drown under the impression that they were hopelessly out at sea. The umbrella was not the only curious life-buoy that was used. One young fellow made a rush for the big drum, jumped overboard with it, and floated ashore at his ease.

A schooner was anchored off Penmon, and heard the bell, but could not make out the meaning or direction of the sound. Those on board of her caught sight of a man struggling in the water, and, taking him on board, heard the first news of the wreck. The boat went off to help, and the schooner's men saved seven in all. The thirteen others of the survivors either swam, floated, or walked to the beach.

The people clustered on the port side or hung round the masts waiting for daylight. The funnel and the masts were soon, however, jerked over. The foremast went last. When daylight came the Straits were dotted

with corpses, slowly floating to the Anglesey shore. One of the corpses was that of a magnificently-dressed lady of gentle birth, whom no friends ever came to own, and who was buried in the rough shell like the poorest of the poor. Among the corpses also was that of Mr. Forster, who had three hundred sovereigns in his pocket, and of whose party only one survived—the little dog.

The most pathetic incident, however, is that with which we will bring this horrible story to a close. Among the passengers was a father and his little boy. After the steamer grounded the two kept together hand in hand, resolved at first to die together. But danger is the great touchstone which brings out the innermost depths of a man's character. Slowly the frightened crowd lessened around them, and the waves seemed to grow bolder as they rose on to the wreck. At last there came a wave that rolled over the father and his boy. It seemed to be a case of one life or the other; and the father—to save himself—unclasped his child's hand.

"Father, father, do not leave me!" screamed the little fellow as the man clambered up out of danger. The father heard the cry as the boy was washed off into the water; and remorse seized him. He would have given his life to recall that moment of selfish weakness.

But the boy was not to die. He was one of those picked up by the schooner; and, weeping bitterly for his loss, he was taken to a cottage on shore and put to bed.

He cried himself to sleep, and woke late in the morning whispering the

"Father, father, do not leave me!" with which he had parted from him he loved. He was answered.

There came a shout of "My boy! My boy!" and he lay clasped in his father's arms. The man had drifted ashore insensible, been put to bed in the same room, and woke to the words that haunted him.

C H E S S.

Problem No. 100.

By H. F. L. MEYER.

White to play, and mate in four (4) moves.

Solutions.

PROBLEM No. 97.—1, Q—Kt4, any of five moves. 2, Q mates at Q6 or K4 accordingly.

PROBLEM No. 98.—1, Kt—R sq., any move. 2, Kt—B2, any. 3, Kt—Q3 mate.

PROBLEM No. 99.—1, R—Kt7, K×P (or a, b, c). 2, Q—B6 (ch.), K×Q. 3, Kt—Q8

mate.—(a) K×R. 2, Q—Kt6 (ch.), K×Q. 3, B—R7 mate.—(b) K—K6. 2, Q×P, any move. 3, Q—K2 or K B3 mate accordingly.—(c) K—Q6. 2, R×P, K—B5. 3, Q—Kt5 mate.

To Chess Correspondents.

W. A. PHILIDOR HARRIS.—Our centennial problem is dedicated to you in recognition of your superior horsemanship, and is described as "The four horses in a row."

J. S.—Observe that the following moves in Problem No. 89 lead to a draw: 1, R—B8, Q—Q2. 2, R—Kt8 (ch.), K×R. 3, Q×R, P—R4. 4, Q—K7, Q—Kt5. 5, P—Q7, Q×B P (ch.), and draws by perpetual check.—If 4, P—Kt3, then Q—R2, and White will either try to give check or attack the Q P, or push his R P forward.—The move of 1, R—B7 is more easily decided by Q×P (ch.). 2, Q×Q, R×Q. 3, P—Q7 (or a, b), R×P (ch.). 4, K—Kt3, R—Q5, and draws.—(a) P—Kt3, R—Q5.—(b) R—R7, R×P (ch.). 4, K—Kt3, R—Q5. 5, R×R P, K—B3, and White has the better game.—The variation c on page 367 might be shortened by move 8, Q×R.

J. B.—To page 351. Problems of three pieces consist of the two Kings, a Queen or Rook, or Pawn, and are therefore very easy, like

PROBLEM No. 101.

White: K—Q B5; P—Q B7. Black: K—Q R sq. White to play, and mate in three moves.

Four pieces can produce some fine problems, as is shown by the following:—

PROBLEM No. 102.

By W. A. Shinkman.

White: K—Q Kt2; Q—K Kt4; B—Q R4. Black: K—Q R4. White to play, and mate in four moves.

PROBLEM No. 103.

By H. F. L. Meyer.

White: K—K6; Q—K2. Black: K—QB8; P—Q B7. White to play, and mate in eight moves.

On the other hand, even a two-mover may require as many as 22 pieces, thus:

PROBLEM No. 104.

By J. A. W. Hunter and H. F. L. Meyer.

White: K—Q R8; Q—Q B3; R—K R6; Bs—K B2 and 7; Kts—Q R7 and K R8; Ps—Q B6, Q2, Q5, K4, K Kt6. Black: K—Q3; Q—K R6; R—K R4; Bs—K B8 and Q R6; Kts—K4 and Q Kt7; Ps—K Kt4, K2, and Q B2.

Five pieces produce some very difficult positions, as for instance this, by J. Kling: White: K—K B6; R—Q Kt7; B—K B4. Black: K—K R sq.; R—Q R8. White to move and mate in sixty-four moves.—Or this, by B. von Guretzky-Cornitz: White: K—Q Kt2; Kts—K3 and K R3. Black: K—K Ktsq.; P—K R5. White to play, and mate in sixty-four moves.

C. J. F.—Notice in Problem No. 91 that not only White, but also Black, can promote the P to a Kt.

THE "BOY'S OWN" GORDON
MEMORIAL FUND.

(Continued from page 496.)

AFTER our last number had gone to press we learnt that the Editor of the "Globe"—who when he wrote to us knew nothing of our having already started a special "Boy's Own" Fund—intended by his letter to appeal for our co-operation in some other undertaking, and not to suggest that we should inaugurate a separate scheme. This merely by the way.

Since the "Boy's Own" Fund was started, many Gordon Memorial Funds have been suggested, and several have actually been begun. Though the needless multiplying of efforts having a somewhat similar object in view is, of course, for obvious reasons, to be deprecated, those now more prominently before the public need not, if a little care is exercised, in any way clash, nor present the remotest semblance of rivalry.

First, in order of time, amongst what we may call the *Home* efforts, as contradistinguished from the Port Said scheme, comes our "Boy's Own" Fund. Next a fund has been started that we should like to see assume national proportions, and do amongst adults what we hope to accomplish amongst and by the agency of our boys. Its joint-treasurers are Mr. John MacGregor ("Rob Roy"), whose interest in the BOY'S OWN PAPER is well known to our readers, and Mr. H. R. Williams, who is one of the Religious Tract Society Committee by whom the BOY'S OWN PAPER was started, and whose special interest in Ragged Schools is well known. Mr. Williams, in a letter to the daily press dated April 9th, thus explains what he and his coadjutors are aiming at: "A number of gentlemen interested in promoting the welfare of poor children have just met to consider in what way this object could be best promoted, when the following resolution was unanimously adopted: 'That the Committee of the Ragged School Union and the Council of the Reformatory and Refuge Union be requested to form themselves into a central committee (with power to add to their number) to raise a Gordon Memorial Fund for the benefit of poor children.' The resolution forming the committee, as well as the object itself, have, I have reason to know, the approval of the late General Gordon's family. I cannot at present state definitely the form which the memorial is likely to take."

We have chatted with Mr. Williams on this work, and he wishes us all success in our own special effort.

Thirdly, there is the proposed Gravesend Gordon Memorial—first, it would seem, for the purpose of building a Home at Gravesend for Poor Boys, and secondly for the purpose of providing a Public Recreation Ground there. With this effort, too, we have been invited to co-operate; but, while wishing the committee abundant success, we have thought it best to keep to our own definite work on our own lines.

Ours is essentially a BOYS' Memorial to one whose memory English-speaking boys the world over may well delight to unite to honour. Our Fund is intended to be essentially representative of British boyhood—a memorial raised by boys for boys, in fond memory of a noble boy-lover. We hope that boys of all ages and conditions of life will take it up heartily and make it their very own. It will be specially graceful on the part of our leading public and private school-boys thus to stretch out a friendly, helping hand towards lads less happily circumstanced than themselves. But we should certainly not like the effort to be limited to schools. British boys everywhere, we hope, may join in the good work, and a "long pull, a strong pull, and a pull all together" is bound to win success.

We rejoice in the proofs already received of the way the scheme commends itself not

only to boys, but also to their elders. Thus the Rev. A. N. Malan, M.A., of Eagle House School, Wimbledon, writes: "I think your idea about a Boys' Gordon Memorial Fund excellent, and I am sure my boys will support it with zest when they return." Other head masters write in the same spirit; and one, representing one of the largest London schools, adds: "I would make a suggestion. Would it not be better not to push collections in schools until the beginning of next term? Our boys here would be glad to make a collection then, but just now . . . they have about come to the end of their pocket-money. I intend to remind my boys of this again next term." Dr. Gordon Stables and Mr. Talbot Baines Reed both write for cards, the latter adding: "I am greatly pleased to see that the B. O. P. is starting a Gordon Memorial. His splendid example will always be a beacon light to English boys, and I am sure they will respond eagerly to your appeal. If I can be of any service beyond recommending the movement to my own boy friends, which I shall gladly do, please let me know."

The press, religious and secular, and of all shades of opinion, is equally favourable to our effort. To take but two examples. Says the "Rock": "The movement is an excellent one, and we heartily wish it all success." Says the "Baptist": "Amongst the many suggested 'memorials' of Gordon is one already started by the well-known BOY'S OWN PAPER of the Religious Tract Society, that appears not only eminently appropriate in itself, but open to none of the objections that have been urged against the Port Said scheme. There seems a peculiar fitness in the 'boys,' whom Gordon loved so tenderly, *taking the matter in hand for themselves*. They will doubtless carry on their peaceful campaign with characteristic enthusiasm, and win the success they will deserve. The proceeds of the fund are to be 'wholly applied in accordance with Gordon's known wishes—that is, for the benefit of poor boys.'"

We shall now be glad to receive donations with all convenient speed. *All receipts will be duly acknowledged in our columns.* Collecting-cards may now be had, but many readers may prefer to give right out rather than collect. *All* should endeavour to do something, however small. Girl readers, of whom we rejoice to have many, may of course also assist. Amongst those who have already received collecting-cards we may mention the Hon. R. L. N. Brabazon, and Lady Brabazon has also intimated her interest. We hope to begin to print the names of donors in our next number.

OUR NOTE BOOK.

A SCHOOLMASTER'S TRIBUTE TO GORDON.

The happiest epitaph that we have seen on General Gordon is the following, published in the new number of the "Journal of Education." The verses are signed "E. D. A. M.," under which initials we have no doubt that we recognise Mr. E. D. A. Morshead, formerly Fellow of New College, and now an assistant-master at Winchester:—

FOR THE GRAVE OF GORDON.

"I had rather be dead than praised."—C. G. G.

By those for whom he lived, he died; his land

Awoke too late and crowned dead brows with praise.

He, 'neath the blue that burns o'er Libyan sand,

Put off the burden of heroic days.

There, strong by death, by failure glorified,
O never proud in life, lie down in pride!

AN AMERICAN TRIBUTE TO GORDON.

The following interesting extract is from a letter just written by Mr. J. G. Whittier, the Quaker poet of New England: "For years I have followed General Gordon's course with constantly increasing interest, wonder, and admiration, and I have felt his death as a great personal bereavement. A providential man, his mission in an unbelieving and selfish age revealed the mighty power of faith in God, self-abnegation, and the enthusiasm of humanity. For centuries no grander figure has crossed the disc of our planet. . . . We Americans, in common with all English-speaking people the world over, lament his death and share his glorious memory. . . . He has made not only England, but the world richer for his memory."

OUR OPEN COLUMN.

SIMPKINS PRIMUS.

BY F. EDMONDS, BRIGHTON.

My name is Simpkins primus, I'm a most unlucky lad,
I sit by Brown secundus, who's a howling little cad;
He ran a needle in my calves, and when I gave a yell,
The master, that's old Boggles, said sarcastically:—

"Well,
My dear friend, Simpkins primus" (he knows that makes me sour),

"Your voice is very beautiful, but—stay in for an hour."

"Bother Boggles" is my motto, for he loves to wear a frown

Like a cheerful little thundercloud that's always dropping down

With "Simpkins, I am certain I distinctly heard you wink;

Do you think that it is right to polish up your nose with ink?"

In wiping all my tears away I hadn't time to think,
But used a duster just employed for mopping up some ink!

My back is very tender, and I felt the brutal cane,
For, as the poet somewhere says, "the blows came down like rain."

I frolicked round about the room in ecstasy of woe,
And when at length my much-respected master let me go,

"Take your head, sir, to the housemaid, 'twill be handy as a mop,

If you wear such lovely collars you'll be taken for a fop."

Now tell me what on earth could be more innocent than peas?

But just because friend Boggles saw me with them, if you please,

He turned my pockets inside out and confiscated, then,
A knife, a comb, a button-hook, some toffee, and a pen,
Three peppermints, an apple-tart, and what has made me sad,

A sketch with an inscription, saying "Boggles is a cad."

THE BIRCH-BARK CANOE.

A constant reader, A. H. Hardwick, writes from Mudgee, New South Wales, under date of Feb. 2nd.—"On looking through No. 245 of Vol. V. I read your article on the Canadian or birch-bark canoe, and at once determined to make one. I could not, however, swim at the time; so, taking your advice, I first learnt that art. Then I tackled the canoe. It only took me ten nights to build and paint it (I have no spare time during the day), and, thanks to your well-written instruction, I was very successful. I have sent you by same post as this one of our local newspapers, with a rather lengthy paragraph describing my canoe. It is twelve feet in length, twenty-seven inches beam, and twelve inches deep, and weighs seventy pounds. Not being able to obtain any of the wood you mention, I purchased some pine. The stringers are half an inch, and gunwales one inch thick; and for the ribs I have used hoops of casks. I have compartments each end filled with cork, and also lockers, leaving a space six feet long to sit in. It holds two persons comfortably. The canoe is quite a novelty in our town, which is 190 miles west of Sydney."

Here is an extract from the paragraph referred to in the Mudgee local paper: "It is refreshing to have to record, in these days of larrikinism and degeneracy which seem to have taken hold of a large number of

our Australian youths, a bright contrast. A. H. has devoted his leisure time in breeding fancy pigeons, always making his own cages, and has taken several prizes for his birds in Sydney and Bathurst. Whilst perusing the BOY'S OWN PAPER, in which a drawing and specification on how to construct a canoe caught his eye, he determined to try and construct one, and in about a fortnight he completed his self-imposed task, without any outside aid, in a most creditable manner. The framework is very light pine battens, bent to an even sweep. The bilge is formed of half hoops. There are two lockers for the reception of supplies, and a compartment at both ends filled with cork. The whole of the exterior of the canoe is covered with best navy canvas, and painted white, with a blue border around the top edge, and the word 'Mascotte' is painted on both sides. The weight of this neat little craft is about seventy pounds. She has been successfully launched on the Cudgegong, and can be seen any afternoon, after business, manned by her gallant and ingenious little owner, at the rear of Bleak House, or during the day at his boat-shed in Market Street."

CANVAS BOAT.

J. L. writes from the West End, South Brisbane: "I know you will be glad to hear that the B. O. P. is a great favourite in Queensland. I have seen boys and bullock-drivers reading it up in the bush two a ta time."

"I have built a canvas boat according to your directions, but not quite the same shape. She is double-ended, and two feet six inches of the ends are filled with cork, so if she swamps she will not sink. We made her to paddle, but have since fixed a pair of outriggers and use sculls; the iron of the outriggers runs through the inside of the boat like a rib. She is called 'Bob,' and is fifteen feet over all, two feet four inches beam, and three inches keel, and one foot deep. I have had two other fellows as big as myself in her, and I weigh about ten stones. The cost, £4, including a second coat of paint. Allow me to recommend Tarr and Wenson's metallic or copper paint to paint boat-bottoms with; it stands a great length of time without cleaning."

Correspondence.

LLWYD.—Shot is made in tall brick towers with iron frames. In the top chamber is a melting-pot, whence the metal is dipped out in iron ladles, and poured into colanders whose orifices are somewhat smaller than the shot is desired to be. The metal drops down into a cistern, and the shot assume the globular form in their descent. The shot are of all sizes, but never smaller than the holes in the colander, and have to be sorted. The fall varies from a hundred to a hundred and fifty feet. Buckshot is cast in moulds, and is not made in the towers.

J. JONES.—You can mark your name on the knife-blade by first painting the blade over with Brunswick black, then scratching your name out so as to leave the steel exposed, and then pouring on it a little aquafortis or dilute nitric acid.

B. DEVON.—1. Clean the gilt frame with a weak solution of sal volatile in water. 2. Cut your stencils out of Whatman's hand-made double elephant paper. Continuous cartridge-paper is also suitable. Before using it coat each side with boiled oil or boiled oil and varnish. The oiled royal sold for press copy-books is well adapted for stencilling.

GWALIA.—For practical chemistry try Roscoe, Bloxam, Valentin, Fownes, or Meldola. Your best plan would be to join a Science and Art class, and make the educational experiments therein required the base of your studies. You will then be able to select the best book to suit you. There is a list of books in the Science Directory, published by the Department, price sevenpence post free.

I. P. J.—1. Not directly, but by a roundabout route. Florin comes from Florence, and Florence from Fleur-de-Lis, the arms of Tuscany. 2. Ink comes from *encaustum*, the Latin for "something burnt in," as the letters were made by the stylus in the wax. The encaustum of the old Roman days was the special red ink which the emperors used for their signatures. The red colour of sealing-wax is due to the same practice. Pen is of course from *penna*, the quill.

P. KAUBE.—Supplement in the sense quoted means the remainder after dividing by the nearest ten. To square by supplement you add the supplement to the number, multiply the sum by the base, and to it add the square of the supplement. Thus, to square 18 you take 8, the supplement, add it to 18, and get 26, which you multiply by the base, 10, and get 260, to which you add the square of 8, or 64, and $260 + 64 = 324 = 18^2$. In another example you will see the advantage better. $1007^2 = 1007 + 7 = 1014 \times 1000 = 1014000 + 7^2 = 1014049$.

INQUISITIVE.—The ballad of "The Revenge" is by Lord Tennyson, and will be found in the latest edition of his collected works. Messrs. Macmillan are the Laureate's publishers.

NAIVETE.—If you procure a copy of the "Civilian" or the King's College "Civil Service Candidate," you will find all your queries fully answered.

ETCHING.—1. There are no cheap books on etching. Apply to Messrs. Seeley, Jackson, and Halliday, publishers, Essex Street, Strand. 2. Neither articles nor illustrations can be reproduced without our permission.

LEPANTO.—Seven yards on a vessel's mainmast is the latest rig. Mainyard, lower topsail-yard, upper topsail-yard, lower topgallant-yard, upper topgallant-yard, royal-yard, and skysail yard. "Yards" are only used above the skysail when the skysail is not big enough, and are merely booms with no fixed names and in no fixed order. Sails above skysails are merely fancy articles, not appearing in a ship's inventory. They bear such names as skyscrapers, skytrakers, moonrakers, cloud-ticklers, etc.

A DELIGHTED READER (St. Hilaire, Canada).—Instructions for working the Shadow Show were given in the May part for 1882.

ROYAL NAVAL ARTILLERY VOLUNTEERS.—For information regarding the corps apply to Mr. E. Wildy, 3, Threadneedle Street, E.C.

R. SPOULE.—In the spaniel and allied breeds the skin between the toes comes well up along the joints, and hence the dogs are said to be web-footed.

S. E. C. (Sierra Leone).—1. All the books can be obtained through Simpkin, Marshall, and Co. The price of the first you mention is two shillings, the last is out of print. 2. The "pocket timepiece" is merely a small wooden sundial, and is hardly worth the trouble of sending such a distance for. 3. In Wyman's Technical Series there is a five-shilling book by Wilson on practical printing that might suit you.

A JOLLY TAR.—The oil covers the waves as with a cloak, and prevents them breaking. It acts very much in the same way as the piece of wood in a pail of liquid, which keeps the contents from slopping over.

A. A.—1. A charter-party is the technical commercial phrase for the agreement for hiring a ship. 2. Cancellation means literally the crossing out with strokes in the form of trellis-work. 3. "Hypothecate" is a long word for "pawn."

B. T. Z.—1. The cheapest historical peerage is in Whitaker's Almanack. Get the edition with supplement, price two shillings. 2. The Army List is published by John Murray, Albemarle Street, W.

A DULWICH BOY.—There is a great difference between the arrangements for an illustrated magazine and those for a newspaper. We go to press so long beforehand that all mere news would be useless.

PATTERN.—We do not know of a market for such stencils. The patterns for tile-work, etc., are printed in sheets, and have to be used as transfers.

PLUNKY.—The instructions on Snowskate-making were on page 464 of the fifth volume.

C. MAHON.—The articles on Goats were in the March and April parts for 1882.

W. HOSS.—For mouldings for picture-frames try Beckmann, of Cow Cross Street; or Rees, of Drury Lane.

JUSTICE.—We never answer legal questions. Our advice to ill-treated apprentices invariably has been "to grin and bear it." In many cases there are faults on both sides, and at the worst the tyranny will end at a stated time. Do your best, learn all you can; and when in due time it comes to you to be a master, think of what you have suffered as a warning, and do not ill-treat the poor lads that are then entrusted to you.

SCHOLASTICUS.—We are delighted to hear that we have just the ~~seventy~~ part of our ancestor of a thousand years ago, but we are in no way comforted or appalled thereby. We have no doubt he was an exceedingly good fellow, and so were all the other 8,589,934,591 to whom you assure us we are indebted. As, however, the world is pretty full now, and it has only 1,400,000,000 inhabitants, we fail to see for the moment how it managed to contain half a dozen times as many in the days of King Alfred. However, there is nothing like statistics. We should not wonder if one of the 8,589,934,592 was not some relation of yours, Scholasticus; and so, as a presumably distant cousin, we quite agree with you.

P. and L. D.—The Great Eastern has always had a screw.

FLORIAN.—Your best plan would be to consult the "Gentleman's Magazine," and read Bancroft and the numerous lives of Washington. Any dictionary of dates will give you the complete list of battles.

BAD WRITER.—1. Compare the signature and work in your picture with that in the genuine pictures at the National Gallery. 2. Try any brass founder's, such as Stanton in Shoe Lane, etc., etc. See the directory.

A LOVER OF THE "P. O. P."—1. Messrs. Letts publish some well-known bicycling maps. They cost about a shilling each. You could get a good map of the district at the bookstall. The best map is the Ordnance map, inch to the mile. Apply to Messrs. Stanford, Charing Cross, for their list of Ordnance Survey publications. 2. The peg in the nut of the violin bow takes out. 3. The value of the rupee varies with the market price of silver. Average it at twenty pence.

F. T. GOODMAN.—1. The difficulty with most oil painters is to get the surface rough and powerful enough. You should put your paint on more thinly. 2. All the volumes can be obtained through any bookseller: the first costs six shillings, the others seven shillings and sixpence each.

COGNOSCO.—For bleaching ivory we have given several processes in recent numbers. Refer to your index.

No. 331.—Vol. VII.

SATURDAY, MAY 16, 1885.

Price One Penny.

REGINALD CRUDEN:

A TALE OF CITY LIFE.

By TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER VII.—AN EXCITING END TO A DULL DAY.

HORACE meanwhile had wended his way with some trepidation and curiosity to the manager's sanctum. He felt uncomfortable in being separated from Regi-

"As the cab dashed past it just grazed the sole of his boot."

nald at all, especially when the latter was left single-handed in such an uncongenial atmosphere as that breathed by Mr. Durfy and Barber. He could only hope for the best, and, meanwhile, what fate was in store for himself?

He knocked at the manager's door doubtfully and obeyed the summons to enter.

Brusque man as the manager was, there was nothing disagreeable about his face as he looked up and said,

"Oh—you're the youngster Mr. Richmond put in here?"

"Yes, sir, my brother and I are."

"Yes, and I hear you're both fools. Is that the case?"

"Reginald isn't, whatever I am," said Horace, boldly.

"Isn't he? I'm told he's the bigger fool of the two. Never mind that, though—"

"I assure you," began Horace, but the manager stopped him.

"Yes, yes. I know all about that. Now, listen to me. I dare say you're both well-meaning boys, and Mr. Richmond is interested in you. So I've promised to make room for you here, though it's not convenient, and the wages you are to get are out of all proportion to your value—so far."

Horace was glad at least that the manager dropped in those last two words.

"If your brother is clever and picks up his work soon and doesn't give himself airs he'll get on faster than you. I can't put you at ease, but they want a lad in the sub-editor's room. Do you know where that is?"

"Yes, sir," said Horace, "I took some proofs there yesterday. But, sir—"

"Well, what?" said the manager, sharply.

"Is there no possibility of Reginald and me being together?" faltered the boy.

"Yes—outside if you're discontented," said the manager.

It was evidently no use, and Horace walked dismally to the door.

The manager looked after him.

"Take my advice," said he, rather more kindly than he had hitherto spoken; "make the best of what you've got, young fellow, and it'll be better still in time. Shut the door after you."

The sub-editor's room—or rooms, for there was an inner and an outer sanctum—was in a remote dark corner of the building, so dark that gas was generally burning in it all day long, giving its occupants generally the washed-out pallid appearance of men who do not know when day ends or night begins. The chief sub-editor was a young, bald-headed, spectacled man of meek appearance, who received Horace in a resigned way, and referred him to the clerks in the outer room, who would show him how he could make himself useful.

Feeling that, so far as he was concerned, he had fallen on his feet, and secretly wishing poor Reginald was in his shoes, Horace obeyed and retired to the outer room.

The occupants of that apartment were two young gentlemen of from eighteen to twenty years of age, who, it was evident at a glance, were not brothers. One was short and fair and chubby, the other was lank and lean and cadaverous; one was sorrowful and lugubrious in countenance; the other seemed to be spending

his time in trying hard not to smile, and not succeeding. The only thing they did appear to share in common was hard work, and in this they were so fully engrossed that Horace had to stand a full minute at the table before they had leisure to look up and notice him.

"The gentleman in there," said Horace, addressing the lugubrious youth as being the more imposing of the two, "said if I came to you you could set me to work."

The sad one gave a sort of groan and said,

"Ah, he was right there. It is work."

"I say," said the other youth, looking up, "don't frighten the kid, Booms, you'll make him run away."

"I wish I could run away," said Booms, in an audible soliloquy.

"So you can if you like, you old crocodile. I say, young un, have you got a chair?"

Horace had to confess he had not a chair about him.

"That's a go, we've only two here. We shall have to take turns on them. Booms will stand first, won't you, Booms?"

"Oh, of course," said Booms, rising and pushing his chair towards Horace.

"Thanks," said Horace, "but I'd sooner stand, really."

"No, no," said Booms, resignedly; "I'm to stand, Waterford says so."

"Sit down, young un," said Waterford, "and don't mind him. He won't say so, but he's awfully glad to stand up for a bit and stretch his legs. Now, do you see this lot of morning papers—you'll see a lot of paragraphs marked at the side with a blue pencil. You've got to cut them out. Mind you don't miss any. Sure you understand?"

Horace expressed himself equal to this enormous task, and set to work busily with his scissors.

If he had had no one but himself to consider he would have felt comparatively happy. He found himself in a department of work which he liked, and which, though at first not very exciting, promised some day to become interesting. His chief was a gentleman not likely to interfere with him as long as he did his work steadily, and his companions were not only friendly but entertaining. If only Reginald could have a seat at this table too, Horace felt he could face the future cheerily. How, he wondered, was the poor fellow getting on that moment in his distant uncongenial work?

"You're not obliged to read all the paragraphs, you know," said Waterford, as Horace's hand slackened amid these musings. "It's a close shave to get done as it is, and he's marked a frightful lot this morning."

He was right. All the cuttings had to be taken out and pasted on sheets before twelve o'clock, and it took the three of them, hard at work with scissors and paste, to get the task accomplished. They talked very little, and joked still less; but when it was all done, like three honest men, they felt pleased with themselves, and decidedly amiable towards one another.

"Now Booms is going out for the grub, aren't you, Booms? He'll get some for you too, young un, if you like."

"No, thanks; I'd be very glad, but I promised to have dinner with my brother—he's a compositor here."

"Lucky man!" groaned Booms; "think of having nothing to do but

pick up types instead of slaving like this every day!"

"See the sausages are hot this time, won't you, Booms? And look alive, there's a dear fellow."

Booms retired sadly.

"Good-natured chap, Booms," said Waterford; "rather a risk of imposing on him if one isn't careful. He's an awfully decent fellow, but it's a sad pity he's such a masher."

"A what?" asked Horace.

"A masher. He mayn't look it, but he goes it rather strong in that line after hours. He doesn't mean it, poor soul; but he's mixed up with some of our reporters, and tries to go the pace with them. I don't care for that sort of thing myself, but if you do, he's just your man. You wouldn't think it to look at him, would you?"

"Certainly not," replied Horace, much impressed by this confidence and the revelation it afforded.

As Booms re-entered shortly afterwards, looking very gloomy, burdened with two plates, two mugs, and a sheaf of knives and forks under his arm, he certainly did not give one the impression of a very rakish character, and Horace could scarcely refrain from smiling as he tried to picture him in his after-hours character.

He left the couple to their sausages, and went out in the vain hope of finding Reginald somewhere. But there was no sign of workmen anywhere, and, to his disgust, he ascertained from a passing boy that the compositors' dinner-hour did not begin till he was due back at his work. Everything seemed to conspire to sever the two brothers, and Horace dejectedly took a solitary and frugal repast. He determined, at all hazards, to wait a minute after the bell summoning him back to work had ceased pealing, and was rewarded by a hasty glimpse of his brother, and the exchange of a few hurried sentences. It was better than nothing, and he rushed back to his room just in time to save his reputation for punctuality.

The afternoon passed scarcely less busily than the morning. They sat—and Booms had contrived to raise a third chair somewhere—with a pile of work in front of them which at first it seemed hopeless to expect to overtake.

There were effusions to "decline with thanks," and others to enter in a book and send up to the composing-room; there were some letters to write and others to answer; there were reporters' notes to string together and telegrams to transcribe. And all the while a dropping fire of proofs and revises and messages was kept up at them from without, which they had to carry to their chief and deal with according to his orders.

Horace, being inexperienced, was only able to take up the simpler portions of this miscellaneous work, but these kept him busy, "hammer and tongs," with scarcely time to sneeze till well on in the afternoon.

The "Rocket," unlike most evening papers, waited till the evening before it appeared, and did not go to press till five o'clock. After that it issued later editions once an hour till eight o'clock, and on special occasions even as late as ten.

The great rush of the day, therefore, as Horace soon discovered, was over at five o'clock, but between that hour and seven there was always plenty to do in connection with the late editions and the

following day's work. At seven o'clock every one left except a sub-editor and one of the clerks, and one or two compositors to see after the eight-o'clock and any possible later edition.

"As soon as you get your hand in, young un, you'll have to take your turn at late work. Booms and I take every other night now."

Horace could say nothing against this arrangement, though it meant more separation from Reginald. At present, however, his hand not being in, he had nothing to keep him after the seven o'clock bell, and he eagerly escaped at its first sound to look for Reginald.

Not, however, till he had witnessed a strange sight.

About a quarter to seven Booms, whose early evening it was, showed signs of uneasiness. He glanced sorrowfully once or twice at the clock, then at Horace, then at Waterford. Then he got up and put his papers away. Finally he mused on a washhand-basin in a corner of the room, and said dolefully,

"I must dress, I think, Waterford."

"All serene," said Waterford, briskly, "the young un and I will finish up here." Then nudging Horace, he added in a whisper, "He's going to rig up now. Don't pretend to notice him, that's all."

Booms proceeded to divest himself of his office coat and waistcoat and collar, and to roll up the sleeves of his flannel shirt, preparatory to an energetic wash. He then opened a small box in a corner of the room, from which he produced, first a clothes-brush, with which he carefully removed all traces of dust from his nether garments; after that came a pair of light-coloured "pats," which he fitted on to his boots; then came a bottle of hair-oil, and afterwards a highly-starched "dicky," or shirt-front, with a stud in it, which by a complicated series of strings the owner contrived to fasten round his neck so as to conceal effectually the flannel shirt-front underneath. Once more he dived, and this time the magic box yielded up what seemed to Horace's uninitiated eyes to be a broad strip of stiff cardboard, but which turned out to be a collar of fearful and wonderful proportions, which, when once adjusted, fully explained the wisdom displayed by the wearer in not deferring the brushing of his trousers and the donning of his "pats" to a later stage of the proceedings. For nothing, not even a pick-pocket at his gilt watch-chain with its pendant "charms," could lower his chin a quarter of an inch till bedtime. But more was yet to come. There were cuffs to put on, which left one to guess what had become of Mr. Booms's knuckles, and a light jaunty necktie to embellish the "dicky." Then, with a plaintive sigh, he produced a blue figured waistcoat, and after it a coat shaped like the coat of a robin to cover all. Finally there appeared a hat, broad-brimmed, low-crowned, and dazzling in its glossiness, a pair of gay dogskin gloves, a crutch walking-stick, a pink silk handkerchief, and then this joint work of art and nature was complete!

"All right?" said he, in melancholy tones, as he set his hat a little on one side of his head, and, with his stick under his arm, began with his gloves.

Waterford got up and walked slowly and critically round him, giving a few touches here and there, and brushing a little stray dust from his collar.

"All right, dear boy. Mind how you go, and—"

"Oh!" groaned Booms, in tones of dire distress, "I knew I should forget something. Would you mind, Waterford?"

"What is it?"

"My glass—it's in the box, and—and I should have got it out before I put the collar on. Thanks; I should have been lost without it. Oh! if I had forgotten it!"

With this awful reflection in his mind he bade a sorrowful good-night and walked off, with his head very erect, his elbows high up, and one hand fondling the nearly-neglected eyeglass.

"Pretty, isn't it?" said Waterford, as he disappeared.

"It is—rot," said Horace, emphatically. "Why ever don't you laugh him out of it?"

"My dear boy, you might as well try to laugh the hair off his head. I've tried it a dozen times. After all, the poor dear fellow means no harm."

"But what does he do now?"

"Oh, don't ask me! According to his own account he's the fastest man about town—goes to all the shows, hobnobs with all the swells, smokes furious cigars, and generally 'mashes.' But my private notion is he moons about the streets with the handle of his stick in his mouth and looks in a few shop windows, and gets half a dozen oysters for supper, and then goes home to bed. You see he couldn't well get into much mischief with that collar on. If he went in for turn-downs I'd be afraid of him."

The bell cut further conversation short, and in another minute Horace and Reginald were walking arm-in-arm in the street outside.

There was much to talk about, much to lament over, and a little to rejoice over. Horace felt half guilty as he told his brother of his good fortune, and the easy quarters into which he had fallen. But Reginald was in too defiant a mood to share these regrets as much as he would have done at any other time. As long as Durfy wanted to get rid of him, so long was he determined to stay where he was, and meanwhile in young Gedge he had some one to look after, which would make the drudgery of his daily work tolerable.

Horace did not altogether like it, but he knew it was no use arguing then on the subject. They mutually agreed to put the best face on everything before their mother. She was there to meet them at the door, and it rejoiced her heart to hear their brave talk and the cheery story of their day's adventures. All day long her heart had gone out to them in yearnings of prayer and hope and love, and it repaid her a hundred-fold, this hour of happy meeting, with the sunlight of their faces and the music of their voices filling her soul.

As soon as supper was over Reginald suggested a precipitate retreat into the streets for fear of another neighbourly incursion. Mrs. Cruden laughingly yielded, and the trio had a long walk, heedless where they went, so long as they were together. They wandered as far as Oxford Street, looking into what shops were open, and interested still more in the ever-changing stream of people who even at ten o'clock at night crowded the pavements. They met no one they knew, not even Booms. But it mattered little to them that no one

noticed them. They had one another, and there was a sense of security and comfort in that which before these last few weeks they had never dreamed of.

They were about to turn out of Oxford Street on their homeward journey when a loud shout close by arrested their attention. Looking round, they saw a boy with disordered dress and unsteady gait attempting to cross the road just as a hansom cab was bearing down at full speed on the place where he stood. They only saw his back, but it was evident he was either ill or dazed, for he stood stupidly where he was, with the peril in full view, but somehow helpless to avoid it. The cabman shouted and pulled at his horse's head. But to the horrified onlookers it was only too clear that nothing could stop his career in time. He was already within a yard or two of the luckless boy when Reginald made a sudden dash into the road, charging at him with a violence that sent him staggering forward two paces and then brought him to the earth. Reginald fell too, on the top of him, and as the cab dashed past it just grazed the sole of his boot where he lay.

It was all the work of a moment—the shout, the vision of the boy, and the rescue—so sudden, indeed, that Mrs. Cruden had barely time to clutch Horace by the arm before Reginald lay prone in the middle of the road. In another moment Horace was beside his brother, helping him up out of the mud.

"Are you hurt, old man?"

"Not a bit," said Reginald, very pale and breathless, but rising to his feet without help. "Look out—there's a crowd—take mother home, and I'll come on as soon as I've seen this fellow safe. I'm not damaged a bit."

With this assurance Horace darted back to his mother in time to extricate her from the crowd which, whatever happens, is sure to collect in the streets of London at a minute's warning.

"He's all right," said Horace—"not hurt a bit. Come on, mother, out of this; he'll probably catch us up before we're home. I say," said he, and his voice trembled with excitement and brotherly pride as he spoke, "wasn't it splendid?"

Mrs. Cruden would fain have stayed near, but the crowd made it impossible to be of any use. So she let Horace lead her home, trembling, but with a heart full of thankfulness and pride and love for her young hero.

Reginald, meanwhile, with the coolness of an old football captain, proceeded to pick up his man, and appealed to the crowd to stand back and give the fellow room.

The boy lay half-stunned with his fall, his face covered with mud, but to Reginald's delight he was able to move and with a little help stand on his feet. As he did so the light from the lamp of the cab fell on his face, and caused Reginald to utter an exclamation of surprise and horror.

"Young Gedge!"

The boy looked at him for a moment in a stupid bewildered way, and then gave a short startled cry.

"Are you hurt?" said Reginald, putting his arm round him.

"No—I—I don't think—let's get away."

Reginald called to the crowd to stand back and let them out, an order which

the crowd obeyed surlily and with a disappointed grunt. Not even a broken leg! not even the cabman's number taken down! One or two who had seen the accident patted Reginald on the back as he went by, but he hurried past them as quickly as he could, and presently stood in the seclusion of a by-street, still supporting his companion on his arm.

"Are you hurt?" he inquired again.

"No," said Gedge; "I can walk."

The two stood facing one another for a moment in silence, breathless still and trembling with the excitement of the last few minutes.

"Oh, Cruden!" cried the boy at last, seizing Reginald's arm, "what will you think of me? I was—I—I'd been drinking—I'm sober now, but—"

Reginald cut him short gently but firmly.

"I know," said he. "You'd better go home now, young un."

Gedge made no answer, but walked on, with his arm still in that of his protector.

Reginald saw him into an omnibus, and then returned sadly and thoughtfully homeward.

"Humph!" said he to himself, as he reached Dull Street, "I suppose I shall have to stick on at the 'Rocket' after all."

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER XIX.—LESSONS.

THE delight of Smirnoff in getting back his pet again was not to be described. We therefore judiciously closed the chapter when he appeared on the scene. Captain Malutin had been rewarded far beyond his most sanguine dreams, and he told his wife that the good fortune that had come upon them was her reward for her heroic victory over herself and her disposition to domineer. She said nothing, but really thought in her own heart that the good fortune was *his* reward for a life of self-denial and more than human forbearance.

They had not yet left the tschast at the time when we resume the thread of our narrative, therefore we have no occasion to visit them in their quaint old lodging. Ivan was as good as his word, and was working well and steadily. He had taken an immense fancy to Tenterton, all of whose time not occupied at the Kremlin was taken by Smirnoff, who also arranged apartments for him in his house in the Loubiyanka, so that Edward had two homes, in each of which he was absolute master.

Both the count and Smirnoff placed a horse and sledge at his special command, so that if he had been able to ride in two sledges at a time he might have done so. Nor is this any exaggeration of what formerly was the mode of treating English teachers and governesses in Russia. The sympathy shown by England with the Turks in the last war, however, greatly changed all this, and from that time the respect paid to the English as a national feature in Russia may be said to have come to an end, but notwithstanding this there were at the period of which we write many families, like those of Count Schaafstadt, where the individual belief in God had not been upset by the unfortunate political views taken by the Russians.

The scene is Tenterton's sitting-room in the Loubiyanka. The persons present are Tenterton and Ivan, who is looking helplessly at a reading-book of which he is supposed to be mastering the contents.

"Well, Ivan, how much of the anecdote do you know? It is not difficult, and we have been over it several times. Do you understand the sense perfectly? You have translated it, but I am not sure that you quite understand it."

"I understand the grammar, I understand the words, so that I could relate

the anecdote in Russian, but I don't see the sense of it."

"Well, that is another question; but tell me your difficulty and I will try to remove it."

"The moral of the story, as you call it, is that George Washington became a great man because he could not tell a lie. Now I think he became a great man in spite of not being able to tell one. That's what we all think in Russia. He must have been very clever indeed to have got on so well without. I can't see the use of being unable to defend oneself or one's friends."

"It is no real defence, Ivan, that is itself a crime."

"That is what you English say in all those tiresome books that the girls pretend to be so fond of. I am more honest, and I own openly I hate them. I like a good, bold, daring deed to read about, something that stirs the blood and makes it tingle."

"My dear boy, I quite understand you. Any boy who is worth his salt must love action and dash. But there is quite as much merit, nay, more, to him who is able to control such violent feelings, and keep them under bit and bridle. The horse of the Ukraine is a wild and very dangerous animal, but under control he is the most useful servant to man. So the active mind uncontrolled is a fierce and savage beast, but with discipline it is the grandest gift we have."

"That is all true enough, but has nothing to do with telling lies. I think it is much better if, for example, I am asked who did something queer at school, for me to say I don't know than to get a schoolfellow punished."

"I do not admit that, Ivan. You may always refuse to tell, and few schoolmasters would try to force a boy to reveal what schoolboy honour would induce him to keep in his own mind."

"Oh, wouldn't they? Try Schwann!"

"Of course there are many cases where the truth should and ought to be known, and the master should always have the right of insisting on knowing the truth, for boys cannot be expected to be the best judges of their own conduct. If that were the case, why should they go to school?"

"That is all very fine, but it does not prove to me that I may not defend myself when I get into a scrape by say-

ing that I know nothing about it; or if a friend—Abrazoff for instance—were to do something which, if known, would make old Schwann mad with rage, shouldn't I be a mean cad to go and split on him?"

"Certainly, unless he had done some great wrong, and your silence would cause another to be punished."

"I should say I had done it myself."

"Then you would be very criminal, for in the first place there would be the crime of lying (which *is* a crime, after all), then the crime of shielding the guilty party, and lastly the wrong done to Mr. Smirnoff in making him feel that all his care had been wasted upon an unworthy, ungrateful boy."

"Oh, I should tell *him* the truth of the matter."

"And pray why should he believe you? If you practise lying as your rightful weapon, why should *anybody* believe you?"

"Oh, he could see in a moment that it was true."

"Come, Ivan, that is nonsense. If people could see at once what was true nobody would tell any more lies, as it would be useless."

"That is so; but it does not prove that lying is wrong, and it can't be wrong, it is so natural."

"It is natural for a tiger to tear a man to pieces, and it is not wrong in the tiger; but it is very wrong in a man to murder another."

"That does not prove lying to be a sin."

"No, but it proves that things which you call natural because they are done, are not of necessity right on that account."

"If you would show me that lying is wicked I would never tell another lie as long as I live!"

"You believe the Bible?"

"Yes, I do."

"Why do you believe it?"

"Because the priest says that it is the word of God."

"Why do you believe that?"

"I think *you* are wicked now to ask such a question."

"Well, never mind that for the present. I *do* ask why you believe the Bible to be true because it is the word of God?"

After some hesitation Ivan said,

"I never thought of that before ; but I suppose it is because He is the God of Truth."

"My dear Ivan, you have answered beautifully and simply. He is the God of Truth, and cannot lie. He hateth a lie, and His word is Truth. Now, if you set yourself up against Him in any way you oppose Him in that way, and in opposing Him you commit every crime, because His nature is all goodness, and the opposite to that is all evil."

"I don't see why opposing one part of any person is opposing the whole !"

"Think a moment. If I shot at you with a revolver, whether I shot you through the head, or through the heart,

and Ivan was more attentive and more willing than ever. When the lesson was over Tenterton took his leave, and the boy was writing his exercises alone in his room. He had been engaged in work for about an hour, and was conscientiously working away with all his might, when there was a knock at his door, and Smirnoff stepped in.

"Just before we go to lunch, Ivan, I want to have a little chat with you. Are you very busy ?"

"Not now, but I have been very busy indeed, and I have only just finished my work."

"Very well. I shall sit down here and wait until you have done all that you

he has taught me that it is a sin to lie."

"Very good—very good indeed ; but he must not invade the province of the priest. That will never do. I must speak to Simeon Ignatievitch when he comes ; he must look after this. You see, Ivan," he continued, "I am a rich man, and have intended all along to leave you well provided for. I took you into my house as a poor orphan, meaning to educate you, care for you, and leave you a rich man at my death ; but there seems to be a sort of fate against the prosecution of my plan. When you were missing the first time it seemed as though you had been taken from me just to show how vain all

A very serious Conversation.

or through the lungs, I should be equally your enemy, equally to blame, and the attack would be equally upon you wherever the bullet struck."

"I see," said Ivan, "what you mean—that by telling lies I attack God in that part of His nature which is Truth, and by doing so I attack His goodness also. That is very dreadful to think of, Mr. Tenterton. But there is something in it. Our priest never talks like that. I don't know whether it is right or not, but at all events it is a new way of looking at the case. I don't like to promise, but I think I shall make up my mind not to tell any more lies. I am very thankful to you, at all events, for taking all this trouble about me. None of my other teachers ever gave me such a lesson as you have this morning."

They were reading German that day,

have to do, and then we can talk at leisure."

"I have finished ; I am only going to put the exercises into their proper order, and put them away as Mr. Tenterton likes to find them."

"Really, I am very much obliged to Mr. Tenterton for the care he is taking, but I shall want some one else to prepare you for the Lyceum ; and, clever as he is, he can't do that."

"He can do much more ; he can prepare me to become as good as he is himself !"

"H'm !" said Smirnoff. "I hope he is not trying to make a heretic of you ! That would be a very sad wind-up. Does he ever talk about the orthodox church ?"

"Never ; he never speaks of things connected with church observances, but

human wishes are. At great expense, and with great mental agony, I passed through that trial. Then you were lost to me again, and now there is a chance of your being removed from me again."

"Who told you I was going to run away again ?"

"Nobody told me so, but there is a strong probability that you may turn out to be the rightful heir to the whole of the Riazan property of which you have heard Mr. Tenterton speak, and then you are not the poor orphan whom I adopted."

"Yes, I am," replied Ivan, quickly ; "I am not changed, but as soon as you made me your heir I ceased to be a poor orphan, and rich men always become richer. So that, supposing I do inherit this land, it can make no change in the circumstances under which you adopted me. I was a

friendless orphan, but ceased to be so directly you adopted me. So if you come to that, you should have disinherited me again. Though what it would have led to I can't for the life of me see!"

Smirnoff laughed heartily. "You are getting too clever, Ivan; I am no match for you at all!"

"Send me to the Lyceum, and they will soon get all the cleverness out of me—queer lot of muffs the boys are there! But, seriously, if I should be, as you say, a rich man on my own account, you had better give the money you meant for me to those who have to turn out on my account. That would be fair. Only I want to think your house my home, money or no money!"

"You are a good-hearted boy, Ivan. I think, after all, that Tenterton is doing you good."

"Sure of it," interrupted Ivan; "only what I want you to do in case I should become rich without your aid is this: First let me go into Siberia and find Anniesie, bring her home, and then you

may settle some money on her if you like. I shall see that she has plenty as long as she lives. Then, in the next place, I want to serve in the cavalry. There will be war with England some day to get possession of all the land of which she has robbed the poor Hindoos. I should like to serve against the English."

"I thought you were very fond of Mr. Tenterton?"

"I adore him! But he is not England, nor the English nation."

"Well, my boy, should the matter, which has now been brought into court, be decided in your favour, you will be able to follow any profession you like. But if you are to be considered my son and heir, I will never countenance the profession of arms."

"I must get your permission," said Ivan, "for the trip to Siberia. It was a mean thing to promise Anniesie to get her off, and then to send her to Siberia in that way! I have been thinking of fixing some scrape on myself and being sent off at the Government expense, only

people don't come back, and I want to come back again with Anniesie."

"It is nonsense to talk of going to Siberia, Ivan. Your wild ideas will end in serious trouble for us all. You have absolutely no feeling for me. What trouble, pain, and anxiety you have already caused me! And how much more are you thinking of causing. I must talk to General Kakaroff about this wild scheme."

"Sorry I spoke of it if it displeases you, only I had rather go with your permission on account of the passport," replied Ivan.

Smirnoff was silent. "What am I to do?" he thought to himself. "Here I intended to educate this little fellow as a merchant, and he wants to be a soldier! I wanted to find an affectionate grateful son to soothe my declining years, and the young monkey is off after every passing cloud that catches his fancy. I have been a fool for my pains, that's all."

(To be continued)

OUR NOTE BOOK.

DAILY TEMPTATIONS AND DAILY VICTORIES.

The Rev. A. N. Malan, M.A., whose pen is so often busy for the BOY'S OWN PAPER, writes in a little book he has published, entitled "The Young Guard of the King's Army," in a very helpful and sympathetic way of boys' daily trials and temptations. He says:

"There is a verse in the Book of the Revelation which says, 'He that overcometh shall inherit all things; and I will be his God, and he shall be my son.' The Greek word is the present participle *Νικῶν*. It means in classical Greek, 'He that is victorious—he that wins the victory,' but being the present participle, its force must be continually present, not past nor future, and I do not think we shall be wrong in laying some stress upon the present force."

"God gives us daily a certain portion of battle, in which we must either win or lose. God wishes us to be continually winning, because otherwise we must be losing. It is impossible to stand still."

"My dear boy, God promises the final inheritance to him who is conquering now. No one can be conquering who is not in earnest. God might have said, 'He that is always in earnest about salvation shall inherit all things.'"

"Therefore, you are always being encouraged to show now that you are in earnest about life."

"God promises everlasting life to all who prove their faith in His promises by earnest pressing forward to reach them. Therefore, be in earnest. Do not let any day slip away

carelessly. Do the moment's duty with all your might, to the glory of God. That must prove to Him that you are in earnest. In lessons or playtime, whatever you have to do, do it heartily, as to the Lord, and not unto men. You have to conquer in the battle against manifold enemies; one of them is waste of opportunity; others are impurity of thought and word and action, idleness, unkindness, ingratitude. These are enemies in the path, trying to hinder your advance to the Promised Land. It is in fighting against these that God must see that you are in earnest."

"If you are conquering you are on the safe road to heaven, and making definite progress, for he that is conquering shall inherit all things."

"That present participle is very strong. We must cling to it all through life. It is present, not past nor future. For suppose that you are now in earnest about spending each day in the best manner, hiding nothing away from God, but true and sincere, feeling that your conscience shines even before the eyes of God, and suppose that as time goes on you grow careless, like some of the soldiers in the allegory of Agathos, so that it becomes no more a daily conquest and winning the way to heaven, but a gradual drifting away into indifference. What becomes of the present participle? It could no longer apply to you; its promise would not be for you."

"He that is always winning the battle against temptations shall inherit all things. God will be his God, and he shall be God's son."

NAPOLEON'S TRIBUTE TO CHRISTIANITY.

No one will accuse the first Napoleon of being weak-minded or namby-pamby. He strode the world in his day like a Colossus, a man of gigantic intellect, however morally worthless. Conversing one day, at St. Helena, as his custom was, about the great men of antiquity, and comparing himself with them, he suddenly turned round to one of his suite, and asked him, "Can you tell me who Jesus Christ was?" The officer owned that he had not yet taken much thought of such things. "Well, then," said Napoleon, "I will tell you." He then compared Christ with himself, and with the heroes of antiquity, and showed how Jesus far surpassed them. "I think I understand somewhat of human nature," he continued, "and I tell you all these were men, and I am a man; but not one is like Him. Jesus Christ was more than man. Alexander, Cæsar, Charlemagne, and myself founded great empires; but upon what did the creations of our genius depend? Upon force. Jesus alone founded His empire upon love, and to this very day millions would die for Him. Men wonder at the conquests of Alexander, but here is a conqueror who draws men to Himself for their highest good; who unites to Himself, incorporates into Himself, not a nation, but the whole human race."

When John Newton's memory was almost gone, he used to say that, forget what he might, there were two things he never could forget. They were: 1. That he was a great sinner. 2. That Jesus was a great Saviour.

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER VI.—ON THE DEEP, DEEP SEA.

THE Theodora was slipping along like a veritable eel through the water. From stem to stern she really looked a

beautiful craft. She might have had more breadth of beam; if she had, she would not have been so fast. She was

full-rigged, but the masts—masts of hollow iron—looked by no means bulky, nor the rigging cumbersome. In fact, there

was something almost foreign in the latter; they were extra long yardarms, the sails had a more jaunty cut about them than you usually find in your sturdy Britisher, and any one used to a seafaring life would not have failed to perceive that the very canvas itself was of a lighter texture than the ordinary Dundee. It looked as though it would reef more easily, and would catch and hold the wind better, but it was none the less strong for all that.

The Theodora was a black craft, black all over the hull, with the insides of her ports picked out with vermilion. There was little or no rake about her masts, so she did not look what sailors call "saucy," but she looked a viper—that is the word. Manned with true British sailors, there was no "give in" in a ship like this; an enemy might sink those colours, but they could never haul them down. You would have felt that, had you gazed on her as she went glancing over the Bay of Biscay. Had you been a sailor homeward-bound and observed her from your ship's deck you would have said to some one near you,

"Yonder goes a man-o'-war; she is outward-bound, and looks business from bowsprit to binnacle."

There was not much noise on deck, where the surgeon and Benbow, the young navigating sub-lieutenant, were walking up and down in that brisk and hurried manner peculiar to sailors in temperate climates. It was getting near evening. The sun was declining in a bank of grey-blue clouds, and though there was no sea on, a big tumbling swell was beginning to roll in from the wide Atlantic, and if it came on to blow the Theodora would have it "ugly."

There was little noise then, save the churn-churning sound of the screw, for the engines were well down amidships, and the Theodora had a fighting deck beneath the upper one, which was flush. With the exception of two, all the guns, ten in number, were on this middle deck, and abaft of it was the captain's quarters; beneath was the ward-room, and to one side of the steerage, as you might call it, on the starboard side, just outside the door of the ward-room, was the gun-room.

So you will perceive the Theodora was a kind of small corvette. She was built for speed and strength, and had an armament that you could have done well-nigh anything with.

"And you think it's going to be a puff, eh?" said the surgeon.

"My dear boy," said Benbow, "it's going to be a blow, not a puff! Then we'll see what the Theo. can do. But it strikes me she is staunch and true, and there is no doubt about one thing, doctor—we've got the heels of every ship in the service."

"Have we, think you?"

"Think?—I'm sure of it! I don't say we can knock twenty knots out of her—"

The surgeon laughed aloud.

"Ah, you may laugh! but put us to it, and we'll come precious near it."

"Well," said the surgeon, "she ought to have been called the 'Hornet.'"

"Why?"

"Because she can sting and fly away."

"Egad, sir! but she can sting and stay. Sting and stay—sting and hang on like a bulldog!"

"You like her?"

"I do, doctor; don't you?"

"Don't know anything about her yet."

"But I do, though! I saw her built at Pembroke Docks; I know every bolt and timber and plank and plate in her. She—"

What more Benbow was going to say may never be known, for the captain's steward came up and saluted.

"Captain wishes to see you, sir."

"Me?" said the doctor. "Be there in a moment."

He was back again very soon.

He was laughing, but quietly, as if to himself. The doctor stood six feet two in his shoes; Benbow was little over five, so the one looked up and the other looked down.

"The captain's sea-sick," said the surgeon.

"You don't mean it! Ha, ha, ha!"

"But I do! Well, that is the result of having friends in high places, who keep you in a harbour ship till the bottom of her rots out. Just the way of the world! There is dear old Mildmay yonder—been at sea all his life, and done many a plucky thing, and he's only first lieutenant yet."

"And an older man than the skipper."

"Yes; can give him two years."

"Well, I'm off below to the gun-room."

"Why aren't you in the ward-room?"

"I'd just as soon be where I am. Besides, the youngsters want looking after, you know. Look in and see us often, won't you?"

"That I will! Good night."

All ships are merry when homeward bound, but I like to see the crew of a craft happy even when sailing away from home. It shows their hearts are in the right place, and that they really are nowadays, as in the days of Drake and Nelson, hearts of oak. To use a homely expression, the men of the Theodora were all "as happy as sandboys."

So long as the screw was grinding and the pulses of the great engines working steadily little else could be distinctly heard; but when the wind freshened, then, as it blew pretty fair, being abaft the beam, fires were banked and sails set, and from the deck, where the men had their messes and did all their work, a murmur could be heard as from a beehive, interspersed with many a hearty laugh, showing that somebody or other was spinning a yarn, and many a snatch of song or song complete. And even the men on deck, in the intervals of trimming sails, gathered together in little knots, and their busy conversation, carried on in a low tone, showed that their hearts were full, and that they were glad to interchange ideas.

But neither in the gun-room nor in the ward-room itself was the sandboy element entirely absent. Though the chalky cliffs of old England had not long disappeared, all had settled down and felt quite at home.

Only two individuals were far, very far indeed, from being either happy or comfortable. One was the captain. He was down to it, as the doctor explained. The other was Mr. Han D'Austin, the paymaster's clerk. He, too, was "down to it." A tallish young man he was, of fair complexion, and of very delicate, though aristocratic features. It was his first voyage, and he looked but ill able to rough it. He had no cot or couch to recline on like the captain. He was excused duty for a day or two, that was all,

and expected to get round in that brief recess.

He lay about wherever he could get lying room—on the lockers, on a sea-chest, where he had to curl his long legs under him and lean on his elbow, looking for all the world—so Benbow told him—like a devil-fish in a glass tank.

Poor Han D'Austin had to stand a good deal of chaff from his messmates. Even his English, which was, like himself, of quite an aristocratic tone, was criticised. The marine officer, Captain West, was a gentleman of the same type. He had been to sea before, however, but never long enough to rub the *bon ton* polish off him. He also mouthed his English, and murdered his "r's," and, as Benbow said, was altogether too new and too good for a ship's mess.

"I was nevah used to this sort of thing," D'Austin explained to Colin, who had come with the intention of doing him a service. "If my father and mother knew what I am at this moment suffering they would be inconsolable, I do assure you. Believe me, McLeod, low though you now see me pwostate on this howid sea-chest, only one short week ago I was the centah of an admiwing gwoup of family relatives."

"Ha, Mistah Austin," cried Benbow, "can I do anything foh you. Delighted I'm shuaw. Shall I send the steward with a basin and a feathah?"

"I don't want your basin no' your feathah," cried Austin, angrily; "leave me alone, sir."

Benbow was by no means a bad-hearted little fellow, but for his years he was a terribly rough old salt.

"I'm the oldest member of this mess," he explained, the first day they all sat down to dinner. He knocked on the table as he spoke by way of drawing attention. "I'm the oldest member of the mess, and I mean to exact respect from you youngsters, d'ye hear? and if anybody crosses my hawse, let him look out for squalls. Now fall to and take your dinner. Mind, I'm caterer, and I tell you it isn't always nor often either during the commission that you'll settle down to such a good dinner. Fall to. Wait a minute, Quentin Steele, you will take turns every day with McLeod in asking a blessing. Don't have to be reminded of that. Brown, you young son of a gun, take your arms off the table. Who are you, and where are you going?"

"I am a midshipman, sir."

"I can see as much from your togs. Don't look scared, but answer me."

"I'm a supernumerary, sir. Going to join the flagship at the Cape."

"Stupid numerary, are ye? Glad to hear it. We'll soon get rid of you. Don't put your elbows on the table again."

"No, sir."

The wind continued fair, the "blow" that Benbow had prophesied never came, but great seas continued to roll in from the Atlantic, and on these the Theodora rolled and pitched, or combined the motions of pitching and rolling, in a way that seemed very satisfactory to the ship herself, if not to all the crew.

One evening, about a day before the vessel reached Madeira, the wind, that had gone down so far as to permit of stunsails being set both below and aloft, began to freshen up towards sunset, and there were some indications too of squalls. The sky in the east, though, was a sight

to see. It was filled with rolling clouds, great banks of cumulus, grey beneath but white as the driven snow on the tops, and the spaces between these, the rifts in the masses of cloud, were of an intensity of blue that could hardly be equalled.

But lower down and quite close to the horizon the interspaces were green. And these clouds went drifting over the firmament at a speed that told old sailors on board the *Theodora* that there was far more wind high in air than below on the sea's surface.

The sun went down at last behind the western waves, and appeared to set them

"Hands shorten sail!"

There was the usual rattling of feet across the deck as the men scurried along and chased each other into the rigging.

But hardly three minutes elapsed ere a cry arose that startled every one in the ship, fore and aft,

"Man overboard!"

Colin rushed on deck. The ship was being hove-to, the lifebuoy had already been lighted and let go. He was just in time to see a tall figure with long hair floating out on the breeze stand for a moment on the bulwarks, between him

sea. That is the light from the life-buoy.

Two boats are called away, and are being lowered into the water with all speed, and yet how interminably long it seems to Colin ere they reach it. But there is the plash of oars at last, and they are off to the relief. One steers directly for the lifebuoy—the drowning man may already have reached it; the other follows in the wake of the lieutenant, but he must by this time be fully a quarter of a mile away.

There is silence in the ship now fore and aft, a silence broken only by the

"So pale, so drooping, so lifeless."

all aflame. The sun went down like a round red burnished copper shield, and hardly had it disappeared when directly in the east over a bank of grey-blue mist up rose the full moon, and so like in every way was it to the orb of day, which had just gone out of sight, that the ship's boys laughingly pointed to it and cried, "Hurrah! the sun's up again, boys. Morning has come, and we have never been in bed."

Studding sails had been got in two hours before moonrise, then a reef was taken in in the topsails, but still the wind freshened and freshened, and the ship went tearing through the waves, cleaving the dark water with her bows as a knife would have done, and leaving a broad foaming wake behind her that was soon, however, obliterated by the racing waves.

It had just gone eight bells, and shortly after Colin, whose watch it was below, heard the order given.

and the sky, then plunge downwards into the sea.

It was Mildmay; the tall and stately figure with the long, long hair would have told Colin that, but yonder also lay the coat, thrown, as it had been, hurriedly over the hatchway; the coat with its two rows of gold lace and one of gold braid, which distinction the lieutenant's seniority entitled him to.

Colin strained his eyes and gazed after him. How rapidly he seemed to swim! Yet this was more apparent than real, for the ship had not yet quite lost her way, and was drifting to the westward and south.

And all that Colin could see was one little dark spot in the midst of the path-way made by the moonbeams, hidden every now and then in the bars of shade, and anon appearing again on the crests of the heaving waves.

To the right of this moonlit path burns one solitary star on the breast of the

occasional flap of a sail or creaking of a block, for both officers and men, if they have to walk, move upon tip-toe, if they have to speak they do so in whispers.

Fifteen minutes have passed; the boats are hardly visible even by the aid of night-glasses, and so far away are they that not a sound comes from them across the water.

But the silence is broken at last, for there reached the ears of those on board one long, wild, despairing cry. Then all is still once more.

But presently the well-known plash of oars can be heard, and soon the boats are alongside. A few minutes more and they are hoisted on board—the rescued and the rescuer.

Colin could not bear to look upon Mildmay thus, so pale, so drooping, so lifeless. Are they both dead? he wondered, and, wondering, shuddered.

(To be continued.)

DISGRACED BY A MAGPIE.

BY JOHN BENNETT.

THE boy home for the holidays, no matter how much of a darling he may be, is in some households always suspected to be up to every evil under the sun.

I know I was. I took the place of the poor cat, and nothing was broken or disarranged but was laid upon my shoulders.

Every impossible thing, mischance or accident, was ascribed to "Master Charles."

If the pony went lame, it was my fault; if my little brother fell ill, it was through me giving him things to disagree with him; if the servant fell over anything in the passage, I was the culprit

"Come, sir, what about this case?"

who left it there; if the apprentice-boy was behind with his duties, it was "Master Charles" that had hindered him; if the mince-pie or pudding was "small by degrees and beautifully less" after it had been taken from the table, it was "Master Charles" that had been to the larder; if the chimney caught fire, I was accused of it; if uncle in his rambles with me should slip down over a piece of orange-peel on the pavement, it was because I had not run before him and kicked it out of the way; if the clock wouldn't go, I must have been playing with it, for it always went until I came home; if father's books were torn or blotted, "that boy home for the holidays must have done it;" if mamma's head aches, it is through my noise and restlessness; and if the dinner is spoilt, Cook says it was "all through Master Charles hurrying and flurrying her."

I know when I, "Master Charles," came home for the holidays I brought with me a very large amount of animal spirits, and these same spirits sometimes led me into mischief; but then I must say this for myself—that when charged with anything that I *had* done under their influence I always promptly confessed the fact, as every honest boy would, and never screened myself by falsehood, subterfuge, or planting the mischief on the shoulders of another.

But it was to no purpose; I was the author of *all* the doubtful occurrences, and was often specially blamed for not confessing the things that I had not done.

I was often grieved that my word went for so little when I knew that I had never dishonoured it. But "Master Charles" was notoriously a high-spirited boy, and, as I said before, every questionable occurrence that happened while I was home for the holidays was posted to my account, but always good-naturedly balanced by the endearing terms, "Well, bless his heart! his holidays will soon be over; let him have his fling!"

My father was one whom I might well love—social, liberal, and good-tempered; and it is saying a good deal for a father when a son confesses that he always liked him for a companion. He lived in gentlemanly style in a beautiful suburb of the metropolis, and, amongst other agreeable hobbies of his, he kept a magpie, and a very beautiful bird was "Jack." But he was a magpie all over, from his cunning eye to the tip of his long and graduated tail, and his chatter and thievish propensities. He cared for nobody in the house but my father. I, being seldom at home, never made much of Jack's acquaintance. He would come and perch on my knee when I called him "Jack," and look quizzingly in my face if I was eating anything, and draw my attention more particularly to his presence by coaxingly crying, "Charley! Charley!"

Jack had been presented to my father by a friend in Ireland, where these birds are not so scarce as now in England. He had a beautiful plumage; his head, neck and back, and under part of his tail, were jet black, and in certain lights a blue gloss was distinguishable, and this, again, was relieved and contrasted by white and green intermingling.

During the midsummer holidays my father had invited an elderly gentleman—an LL.D., and a terrible bookworm—to spend a fortnight at his house. He was not a very genial man, and above all

things he could not bear any interruption to his literary studies.

His son was my father's partner, and, although he was not, a great favourite in our home, father regarded him for being a good man, and respected him for being a learned one.

Dr. Millbank was not a companionable man, his delight in life being the solitude of a library; and it was on account of my father having rather a large collection of books that the doctor so delighted to make us a visit.

Well, the doctor took but little notice of any of us, as he came for the books in the house, not for the humanity it contained, and certainly not for the "boy home for the holidays."

As a rule, I invariably kept out of his way; but one day, being fresh home for the holidays, and the doctor being in a more friendly and talkative mood than ordinary, I ventured to accompany him into the library, taking care only to speak to him when he condescended to speak to me.

The doctor, however, soon became lost in a book, and altogether forgot my presence. I accordingly retired into the recess of a window, and also engaged myself with a book on old sports and pastimes. Dr. Millbank's back was turned upon me, and he was thoroughly lost in his studies. I was too much amused in observing my father's friend to regard the book I had taken up, although a very interesting one.

He was a Dominie Sampson over again, and must have sat to Sir Walter Scott for his portrait, only that the doctor paid more attention to his dress than the dominie, and made great display of an elaborately stiff-starched white neckcloth and a frilled shirt. He was a tall, thin man, with a military uprightness, a peculiarly long neck, and a small head, which could not boast a single hair; and, to keep the obnoxious flies from troubling his bald pate, he threw his capacious handkerchief over it. In the style of his day, two heavy gold seals hung from a watch-pocket of his trousers.

Now, learned as was the doctor in his special subjects—mostly of the dry-as-dust order—he knew but little of the natural history of magpies; and at the present moment my interest and the interest of my story is with one of those birds, Jack by name.

And here he comes, and, as he thinks, unperceived by any one. But Jack, for all his cunning, is for once mistaken, for while I held my book as if attentively reading it, my eyes were peering over the top of it to watch his movements. Yes, here he comes, hopping into the library, and, to elude observation as much as possible, he hops along by the wall.

It seemed by his turning his head cunningly first on one side and then on the other that he had some special object in his visit. Once or twice he paused in his hop and stood on one claw, and quizzed me to see how far I was engaged or asleep, or anything but noticing him. I felt sure by his cautious, sly manner that he was on some thievish expedition, what, for the moment, I could not discover. He looked remarkably pert, grave, and mischievous. Jack was very tame, but very sagacious, and had taught himself a variety of odd tricks, and would rival any parrot for volubility.

Close by the reading-table that Dr.

Millbank was engaged at stood a capacious arm-chair. I observed that Jack, ultimately and by stealthy hops, managed to hide himself in a corner of the chair, unperceived by the studious occupant, who, I believe, would not have taken his eyes from his book had an elephant entered the room instead of a magpie.

While he was ensconced in his citadel of the chair he kept his cunning, twinkling eyes fixed on the doctor's shining silver spectacles on his nose. Magpies are fond of pilfering bright or glittering articles, which are very attractive to these birds. But although he was evidently admiring the doctor's spectacles, I had no idea that his thievish heart was contemplating the ways and means to deprive the absorbed owner of them. He continued at the bottom of the chair, winking and blinking, but his vision always directed to the glasses, for about half an hour, but being then no further towards the possession of the spectacles he became impatient, and adroitly contriving to elude the doctor's observation he hopped upon the arm of the chair and perched there. For a little while he feigned to be in a most luxurious repose, and no one could imagine that at that moment, well known as he and his tribe are for petty pilferings, he was meditating a theft.

While, however, in his more elevated position, and seeing no hope for the present of purloining the spectacles, he stealthily took the leather case which the doctor had laid upon the table after taking the glasses therefrom. I continued to watch, but said nothing, for I too much enjoyed the fun, although I felt that when the doctor discovered that his case had vanished there would be a scene about it; but I had no idea that they would pounce upon the boy home for his holidays. Jack neither knew nor cared that he was getting me into disgrace with my father's friend and visitor, and who would have been the last person in the world for me to take any liberty with.

The magpie, in the same sly manner that he made his entrance into the apartment, made his exit out of it, turning his long black tail upon the doctor as he hopped along, and his beak holding the case as near the wall as possible.

He had not long made his escape from the room when the doctor, weary of his book, took his spectacles from his nose, and naturally enough sought the case to place them in. The case was not to be found—at least, not by the doctor. I kept closely to my book, or pretended to do so, for my eyes were now as observant of the doctor's proceedings as they had been of the magpie's.

The doctor looked all over the table and under it; he examined each of his pockets, then rose from his seat and investigated his chair, likewise the arm-chair, while I distinctly heard him grumbling and mumbling,

"This is most mysterious. I know I placed it on the table. Dear me! dear me! always something to annoy me. Bother those flies!" he exclaimed, brushing them from his bald head, from which he had now taken his handkerchief.

It was very wrong, no doubt, to laugh at the misfortunes or annoyances of other people, but I was home for the holidays, you know, and I really could not help it.

Could he have brought the case with him? Oh, he was perfectly sure that he had, and it was most mysterious where or how it vanished, for no one had been in the room.

He laid down his spectacles on the table, while he took a ruminating walk round the room, holding his sharp chin in his hand and frowning in his displeasure and mystification, while he looked to the right and the left of him, and on the floor, and then he espied me lounging with outstretched legs in the recess with my book of sports.

"Ah, ah, Master Charles, and so you are the culprit, are you?"

"Sir!" I exclaimed, affecting to be ignorant of his meaning.

"My case, young gentleman—where is it?"

"What case, sir?" I innocently inquired.

"My spectacle-case—where is it?"

"Spectacle-case? I have not got it."

"What! Why, I laid it beside me on the table, and now it is gone! You should not take such liberties with your elders."

"Why, sir, I have not moved from the spot where I now recline."

"I care nothing about that, sir," the

doctor interrupted, and I was very glad of the interruption, for I hardly knew what I was going to say. "I care nothing about that. The case is gone, and it had no volition of its own, and therefore you *must have taken it*, for no one else has been in the library."

"It is very unfortunate for me, doctor—"

"My spectacle-case, Master Charles, if you please!" he cried, still too impatient to permit me to finish my sentence. "I am too old to be your playmate, and it is a rule of mine never to give or take liberties with the young or old."

"You really, sir, are accusing me for what I have not done," I said, "but—"

"That is all subterfuge, sir!" he broke in impetuously before I could explain matters. "There I laid the case—"

"And it is a very hard case for me to be accused of removing it."

"Your joke is impertinent at a time like this. If your father were here I am quite sure that he would not tolerate your behaviour towards me. You are the only person, as I said before, who has been in the library since I have been reading here—"

"Excuse me, doctor—"

"Do not interrupt me, Master Charles."

I was going to say that you are the only person who has been in the library, and therefore you must have the case."

"I have not got it—there, doctor!" I exclaimed as emphatically as I could. "You were not aware that I was in the library until you saw me."

"What of that, sir?" asked the doctor, in quarrelsome tones.

"This—that as you did not see me enter the room, others might have come and gone without your knowledge. Indeed—"

"Do not mask your tricks with impertinence. I tell you again that I am sure that I laid the case on the table."

"And I am equally sure that I have not got it," I stoutly persisted.

"Then I must ring the bell for your father. Boys home for the holidays take so much licence nowadays that really they have become an intolerable nuisance. They are never happy but when they are in mischief, which is by no means creditable to the training that their parents pay for. There is too much parental petting now to turn out good boys, and too much forgetfulness of 'spare the rod and spoil the child.' There should be no school holidays if I could have my way."

(To be continued.)

RECENT CYCLING.

A CENSUS of the cyclists at the beginning of this year gave 35,000 as the grand total of members belonging to the various recognised clubs. Of these the Cyclists' Touring Club, which holds a peculiar position and can hardly be classed with the rest, claimed about 17,000, while 5,000 were distributed among some 120 metropolitan clubs, 8,500 among 200 provincial clubs, 1,500 amongst sixty Scotch clubs, 400 among fourteen Irish clubs, 100 among seven Welsh clubs, 1,300 among the various tricycling clubs, and the remainder among clubs of all sorts that could not well be classified. Given then 35,000 club men, how many thousand riders of the wheel are there unattached? A moderate estimate would put them at quite double as many, and we shall not be far wrong in assuming that there are at least 100,000 cyclists in the United Kingdom at the present time.

The clubs are of all sorts and sizes, but in our census we have only included those having a fair number of riders, and we have taken no notice whatever of "honorary members" and such purely decorative auxiliaries. Some of the clubs are very strong. In the metropolitan area, for instance, we have the London with 220, and next to it the Pickwick with just the hundred. The Pickwick is the oldest of the clubs, it having been formed in 1870. Almost equal to it in strength is the Stanley, which comes before the public every year as promoting the show of machines, and whose late exhibition on the Thames Embankment was one of the noteworthy events of this season. Among the country clubs there are several that exceed the hundred. Bedford, for instance, has 114; the Birchfield, of Birmingham, has 150; the Speedwell, of Birmingham, has 175. Bournemouth has 110, Cambridge University has 200 members, Jersey 115, Halifax has 100, Lincoln has just over a hundred, and so have two of the Leeds clubs, the Crescent and the Harehills. In Scotland the clubs do not run so large. The two main centres are Edinburgh and Glasgow, and the chief clubs in each are the University with eighty members, and the Lanarkshire with seventy-five. As Edinburgh University is the largest club in Scotland, so Dublin University is the largest club in Ireland, mustering as it does nearly ninety members.

The tricyclists average higher than the un-specialised cyclists; the largest of the metropolitan clubs, the London, boasts 140 members, while the largest of the country clubs, the Brighton, claims 110.

And if the cyclists have improved in numbers, the machines they ride and the times they accomplish have undergone a marvellous improvement likewise. The quarter-mile record is now held by H. A. Speechly, who at the Clapham Park meeting at the Crystal Palace in August last succeeded in covering the distance in 39 seconds. In the month before the same track saw the lowering of the half-mile record to 1 min. 19½ sec. in A. Thomson's match against time. The Surbiton records in 1882 made by the renowned Dr. Cortis still stand for the three-quarter and the mile, the former being 2 min. 1½ sec., the latter 2 min. 41½ sec.; but after these we have a long series of changes all wrought in 1884 on the fast Crystal Palace path. In 1878 the Hon. Ion Keith-Falconer secured the two-mile championship with 6 min. 30½ sec.; the record is now held by H. R. English with 5 min. 33½ sec., a gain of nearly a minute. The records for the three and four miles are held by G. Lacy Hillier, the four-event champion of 1881, who on the 25th of last September rode the three miles in 8 min. 32 sec., and the four in 12 min. 15 sec. On the same occasion Hillier secured the five-mile record with 14 min. 18 sec., a considerable improvement on champion time. In 1879 Cortis was five-mile champion with 15 min. 29½ sec., in 1880 he was champion with 15 min. 10½ sec., and in 1881 Hillier was champion with 15 min. 39¼ sec., and though neither of these were bests they yet serve well as fingerposts to indicate the advance. After the five miles we come to a long string of records clean away to the twenty miles, all credited to H. R. English on the 11th of last September. For the six we have 17 min. 33½ sec., for the seven we have 20 min. 30 sec., for the eight we have 23 min. 28½ sec., for the nine we have 26 min. 22½, for the ten we have 29 min. 19½ sec., for the eleven we have 32 min. 19½ sec., for the twelve we have 35 min. 15 sec., for the thirteen we have 38 min. 16 sec., for the fourteen we have 41 min. 26 sec., for the fifteen we have 44 min.

29½ sec., for the sixteen we have 47 min. 26 sec., for the seventeen we have 50 min. 22 sec., for the eighteen we have 53 min. 20 sec., for the nineteen we have 56 min. 15 sec., and for the twenty we have 59 min. 6½ sec., which, considering how a few years ago it was declared to be impossible to ride twenty miles within the hour, is something worth making a note of, as is also the fact that before the hour was completed English had added another 560 yards to the distance traversed, and thereby secured the record for the longest run within the hour. The Northumbrian was far and away the best man in 1884, but, as we pointed out some time ago, the cycling records are more likely to be improved than those in athletics, owing to there being more improvable circumstances attending them. We improve our paths and we improve our machines, so that any comparison of man with man is always unfair to the oldster. In fact the only true comparison is that which is made between the men on the same track on the same day, and which is such an obvious one that nobody cares to mention it.

The records from the twenty-first to the twenty-fifth mile are still held by Cortis. These we gave at some length in 1880, and so need only catalogue here. They are in due order: 1 h. 3 min. 45½ sec., 1 h. 6 min. 51½ sec., 1 h. 10 min. 9½ sec., 1 h. 13 min. 26½ sec., and 1 h. 16 min. 41½ sec. The records from the twenty-sixth to the thirty-eighth mile remain unchanged since H. F. Wilson secured them at the Surrey meeting in August, 1883, and there has been no change between thirty-nine and fifty since the fifty-miles championship of 1882. M. H. Jephson claims thirty-nine, forty, forty-one, and forty-two; W. K. Adam claims forty-three; C. D. Vesey claims forty-four; Jephson claims forty-five; Keith-Falconer claims forty-six; Jephson claims forty-seven, forty-eight, and forty-nine; and Keith-Falconer has the fifty. As the times were all given in an article on Long Distance Bicycling in the November part for 1882, we need not here tabulate them.

One of the most striking events of last season was the curious match between Mr. Hillier and Major Holmes, in which the

younger man of twenty-eight allowed his senior of seventy-eight a mile for every year there was difference between their ages, and which simply meant that while the major rode fifty miles Mr. Hillier would ride 100. This Mr. Hillier failed to do. He did 146 miles in 9 h. 59 min. 34 sec., while the major covered 115 miles in 9 h. 59 min. 58 sec.—by no means a bad spell for a veteran of seventy-eight. Although Mr. Hillier lost his match, he succeeded in securing the records from fifty-one to fifty-four miles, and all the records over 101, those between fifty-five and 100 being still left to Mr. F. R. Fry, as detailed in an article on the Cycle Championships in the part for December, 1883.

In tricycling all the records underwent a change in 1884 except those made by Mr. Lowndes the year before, for the half, three-

quarters, three, four, five, six, seven, eight, nine, ten, and eleven miles, and the full list now stands:—Quarter-mile 47 seconds, H. J. Webb, Crystal Palace, July 12, 1884; half-mile 1 min. 32½ sec., three-quarter mile 2 min. 18 sec., M. J. Lowndes, Surbiton, July 21, 1883; one mile 3 min. 3½ sec., H. N. Corsellis, Crystal Palace, July 21, 1884; two miles 6 min. 26½ sec., H. J. Webb, Crystal Palace, September 25, 1884; three miles 9 min. 45 sec., four miles 13 min. 3 sec., five miles 16 min. 19 sec., six miles 19 min. 35 sec., seven miles 22 min. 54 sec., eight miles 26 min. 9 sec., nine miles 29 min. 23 sec., ten miles 32 min. 33½ sec., M. J. Lowndes, Surbiton, June 21, 1883; eleven miles 37 min. 44 sec., M. J. Lowndes, Crystal Palace, June 25, 1883; twelve miles 42 min. 24 sec., thirteen miles 45 min. 54½ sec., H. J.

Webb, Crystal Palace, August 7, 1884; fourteen miles 49 min. 21 sec., fifteen miles 52 min. 53 sec., C. E. Liles, Lillie Bridge, June 21, 1884; sixteen miles 56 min. 29 sec., seventeen miles 1 h. 3¼ sec., H. J. Webb, Crystal Palace, August 7, 1884; eighteen miles 1 h. 3 min. 30 sec., nineteen miles 1 h. 7 min. 15 sec., twenty miles 1 h. 10 min. 50 sec., twenty-one miles 1 h. 14 min. 33 sec., twenty-two miles 1 h. 18 min. 3 sec., twenty-three miles 1 h. 21 min. 43 sec., twenty-four miles 1 h. 25 min. 21 sec., twenty-five miles 1 h. 28 min. 58 sec., C. E. Liles, Lillie Bridge, June 21, 1884; thirty miles 1 h. 50 min. 43½ sec., thirty-five miles 2 h. 13 min. 7¼ sec., forty miles 2 h. 31 min. 57¼ sec., forty-five miles 2 h. 52 min. 35¼ sec., fifty miles 3 h. 11 min. 15 sec., 100 miles 6 h. 43 min. 32½ sec., H. J. Webb, Crystal Palace, August 7, 1884.

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

V.

ON many other rivers the methods of fly-fishing differ materially in detail, but the principles are generally the same, or nearly

so. For example, you will find that the flies used on the rapid rivers of the north are not exact imitations of anything, but rather what

is called "fancy" flies, or rather spiders, in that they are all legs and no wings at all, whereas our flies of the south are, as far as

possible, exact copies of the natural insect, and as such are taken by the denizens of our streams. Then again on other thicker and more sluggish rivers you will find that the larger flat-winged flies (as opposed to the upright-winged) are continually resorted to, and capital sport is achieved thereby. Even on the Itchen the night flies are used—sometimes three on a cast, and this cast very coarse—for the taking of a good basket of the largest of our trout. Perhaps also this consummation so devoutly to be wished merits a further explanation before I conclude my gossip on “how to use” the fly-rod.

Imagine then a glowing August sunset. The “king of day” has just retired beneath the massed cloud canopy of his glory, and the tender tints of orange and gold, of purple and hyacinthine hues, are flooding the landscape and glinting on the unruffled stream, turning it to a semblance of that heaven-born sea of glass mingled with fire. Softly and imperceptibly the magic colours deepen and change, and the gloaming steals gently over all. No pearl wreath of dew rises over the river like a chill snow-pure winding sheet to the dead day, but to the good fortune of the night angler the evening closes in on night with starry dark-blue firmament and to the chorus of the bird music to which a dry, still, warm, late summer evening always gives rise. Curious, isn't it? that the eternal fitness of things of which we speak so often, and, alas! care so little to trace out, has so arranged it that the more perfect in summer beauty the night may be, the better is it for

the nocturnal angler, as if, indeed, as is probably the case, not alone do the birds and other of the higher animals delight in the witchery of this ineffable hour, but the fish also appreciate the graciousness and the freshening influences after the intolerable heat and dust of midday? Yet it is so, and if the conditions be less than I have sketched of our ideal night fly-fisher's season, then does his sport fail in a corresponding degree.

But he—rigging up his trusty fly-rod with winch and line and stout fly cast, attached to which is an imitation cinnamon fly, and perhaps a couple of Fetid Browns—sallies forth, and passing by the now placid mill pool gently perchance steps (waterproofed as he is to the waist) into the shallow run of pellucid water which wanders at a pace of two miles an hour over the brilliant pebbles of this chalk stratum. On either side the banks are clothed with sedge, amidst which the tall sceptre-like bulrushes stand out dark against the sky. “He hereth the melodious army of the fowls,” to quote the gentle Dame Berners. There is the sedge-warbler with its pretty quaint song, the plaintive shrill call of the moorhen, and now anear and then afar the harsh burr-like screech of that ventriloquist of birds—the landrail. The agile dachick dips into the water close by him, and in the deepening twilight he just discerns the bonny brown-coated rat as it sits sedately and solemnly enjoying its meal on yon patch of decaying weeds set free by the recent weed-cutting. Ay, and as he bends forward to notice this self-satisfied dweller by the stream,

lo! the luscious sounding kiss-like “chop” of a feeding trout as it takes in one of the larger sedge-flies—probably the actual insect of which Piscator possesses the artificial on his cast. Just watch his movements now. Half a minute is not passed ere the line whistles through the air with a softly sighing sound, and the fly falls, making hardly a dimple in the placid face of the water, just within the rings of vibration made by the rise. Onward it floats, and suck! chop! the fish has risen again, this time to the angler's lure. Little grace is now given, for the time of twilight is fast ebbing away, and absolute darkness or its near approach is by no means so valuable to Piscator as is the present time. So, within the time I have been talking about it, the landing-net is placed under the fish, and the fisher, with a sigh of illimitable content, moves on with lynx eye ever on the watch for the “rise” which unerringly tells of the presence of his quarry. Nor is he always content to watch for this. Now and then he throws his fly in likely spots, such as where perchance an oily eddy circles round some gnarled and rugged root outstretched like toil-battered fingers to clutch the passing flotsam of the water, or the fly goes silently through the air perhaps on to the lipping runnel with a touch as of a mother's kiss, and there finds the feeding trout. And so he fishes till the silence and darkness warn him it is time to rest, and so he returns with a heart of peace fresh from his communion with nature and the “voices of the night.”

(To be continued.)

HEROES OF THE BACKWOODS.

IV.—ISRAEL PUTNAM.

AND now, having dealt with Rogers and the Starks, we come to the most famous of the Rangers—Israel Putnam. Putnam joined the regiment in 1755, and soon afterwards was instrumental in saving his captain's life.

Rogers and he were sent scouting to Crown Point to ascertain the state of its fortifications. Leaving their men in a willow thicket, they went on in front to learn what they could. The sun rose, and the French began to stream out of the fort in such numbers that the retreat of the scouts was cut off. In

about an hour one of the soldiers stumbled on Rogers and was just about to run him through, when Putnam appeared and struck down the Frenchman with his rifle. There was an alarm, but in the confusion both Rogers and Putnam escaped.

In 1757 Putnam was promoted to a majority, and one of his first exploits was to strike on the track of the armament destined to capture Fort William Henry. His report was disregarded, and after a six days' bombardment the fort fell. The garrison capitulated and were to march forth with the honours of

war; so ran the articles, but it would seem that for “honours” “horrors” had been written. For no sooner had the rear guard left the gates than the Indians flew upon the Englishmen furiously, and slaughtered them in cold blood. Not an effort was made by the French to stop the atrocious attack, and only a miserable remnant of the garrison survived. When Putnam, who had been sent forward to the fort to watch the enemy's movements, came on the scene of carnage next day, he found the barracks burning and hundreds of corpses—men, women, and

children—lying half consumed among the ruins.

But it was at another fire that Putnam was to earn his fame. In the winter the barracks in Fort Edward were one night found to be in flames. Within twelve feet of them stood the magazine containing three hundred barrels of powder. Colonel Haviland attempted to batter down the barracks with his heavy artillery, but to no purpose. A line of men was formed to pass buckets from hand to hand. The end of the line was Putnam, who took his station on the roof of the shed as close to the flames as he dared. His mittens were burnt off his hands, but he stuck to his post, and it was not until the roof began to give way that he left it. The walls of the magazine were charred, the outer skin of planks was indeed burnt through, and still he refused to leave until the blaze was quelled. When Putnam's second mittens were pulled off the skin came with them; his face, his hands, his body, were one mass of blisters, and it took him weeks to recover from his exposure. His indomitable resolution had, however, saved Fort Edward.

One day in the course of the following summer he and five men were surprised by Indians while lying in a canoe near the Fort Miller rapids on the Hudson. To remain or cross the river would have been fatal. Before the canoe was under way one of the men was killed. Putnam steered the craft round and made straight down the stream. The current was broken into eddies and whirlpools as it rushed furiously over the shelving and projecting rocks. Without aid from his comrades, who sat aghast at the danger, he guided the canoe down the most promising channel, skimming the rocks and stemming the eddies. Sometimes she would spin round in a whirlpool and halt for a little, then she would shoot off at a tangent and fly down and down until at last the quieter waters were reached. The rapids had never been passed before, and the wondering Indians refrained from firing as soon as the canoe entered the dangerous gorge.

In August Putnam was taken prisoner. He was out with Rogers and Dalzell, and was unexpectedly attacked by Molang and the head of five hundred French and Indians. His rifle missed fire, and an Indian seized him and bound him to a tree. The fight raged for some time. The Rangers rallied and drove back the Indians. The tree to which Putnam was tied was thus brought midway between the combatants in the centre of the hottest fire from both. He stood wholly unable to move even his head while the bullets showered by, and many of them lodged in the tree above him, struck the ground in front of him, and passed through the sleeves and skirts of his coat. The fight raged round him for over an hour. Even the tomahawks began to fly about, and one lodged in the tree an inch above his head.

The Rangers won the battle, but the Indians in their last rally secured Putnam and carried him off. They made him bear the packs of a number of the wounded, and with his hands lashed behind his back marched him for miles into the hills. When night came they stripped him and bound him naked to a tree. They laid the fire ready for the sacrifice, and danced in joy and sang of his approaching doom. At length the brushwood was lighted, but a shower of rain came on and extinguished the struggling flame. Again the torches were brought and at last the circle was aglow. The Redskins danced and sang around the victim and mocked him as he writhed to avoid the fire which was licking up closer and closer. All seemed lost, when suddenly a Frenchman leapt into the clearing, and dashing the Indians aside, kicked the blazing wood away, and cut the prisoner's bonds. The Frenchman was Molang himself, the leader of the Canadian partisans, who had been informed by a messenger of the proceedings of his allies.

Although his life was saved Putnam was

kept a close prisoner. His arms were tied to two young trees, his legs were secured in the same manner, and these trees formed the basis of a curious cage constructed over him, in which the unhappy Ranger spent the dreary night that followed his release from death. He was forwarded to Ticonderoga, examined by Montcalm, and then sent up into Canada, whence he was afterwards exchanged.

He took part in Amherst's operations, and at the close of the war with the French was sent to Cuba with the provincial troops owing to hostilities having broken out with Spain. This was 1762. The transport in which were Putnam and his men was driven on a reef, rafts were made of her masts and spars, and every one reached the shore in safety. They pitched a camp, fortified it, and remained for some days until the storm subsided, when they were taken off in another ship, and joined the convoy for Havana.

On the 14th August Havana surrendered to Lord Albemarle and Admiral Pococke, and the expedition was over. Putnam returned to Connecticut, and after a few months' service against the Indians betook himself to his farm.

On the 19th of April, 1775, the British troops were attacked as they returned from destroying the magazines at Lexington. That was the first blow in the War of Independence. Putnam heard of it as he was ploughing in his field. He left the plough standing in the furrow, and, without stopping to say good-bye to his wife or to change his clothes, started for Boston. With Prescott, Warren, Stark, and Reed, he took part in the battle of Bunker's Hill. Who commanded on that occasion is a moot point; probability points to Prescott. At one time much of the honour—too much—was given to Putnam.

Throughout the night of the 16th of June the strokes of spade and pickaxe fell quick and strong on the famous Boston hill, and column after column of men swiftly and silently marched up to the low redoubt on its crest. The morning came, and as soon as the entrenchment was discovered by the British, orders were given for its storm. The barges with the five thousand men that were to attack it left the fleet a little before noon. Every roof and spire of the neighbouring city had its crowd of spectators anxious for the coming fight.

By three in the afternoon the redcoats had all landed at Morton's Point. The order to advance was given, and up the hillside came the heavily-accoutred British infantry. The redoubt gave not a sign of life; it was silent and still as the grave.

Suddenly, when the height was almost gained, the flame broke forth, and the soldiers, swept down in dozens, leisurely and steadily retreated to shelter. Again they came on; again the fort was silent until they were almost in, and then again came the death-hail, and the redcoats were driven back. Over a thousand were now left behind.

But, as soon as they got to cover, the remnant threw away their knapsacks and awkward trappings, fixed their bayonets, and came up the hill for the third time, shoulder to shoulder, steadily as on parade. In vain the Americans reserved their fire as before; in vain they mowed their assailants down as they neared the parapet. The Englishmen were now free, and more fitted to cope with them, and on, unchecked, came the line of cold steel. The gaps closed up as quickly as they were made. The redoubt was reached, surrounded, swept clear, and the routed Americans were driven off down the slope and over the neck, and away to the Winter Hills.

Such was the Battle of Bunker's Hill, which nine Americans out of ten still speak of as a Yankee victory.

After Bunker's Hill, Putnam, now a general, was employed in sundry expeditions with varying success. Though a most popular character with his men, he does not ever

seem to have worked harmoniously with his superior officers. His best-known exploit is his riding down the hill named after him, near West Greenwich. The hill is cut deeply into terraces, and he is said, when caught napping by a British force under Tryon, to have ridden his horse down the precipices.

Many other exploits are recorded of him, some of which rather verge upon legend. That he was an extraordinary man there can be no doubt. The stories of his early life give eloquent evidence to his character. He was born at Salem in 1718, and from the first bore that reputation of being clever and strong, and unusually fearless and frank, which he retained until his death in 1790. He married young and settled at Pomfret, in Connecticut, forty miles east of Hartford, where there afterwards occurred his fight with the she-wolf. The story runs that Pomfret was ravaged by a wolf family. The cubs were generally killed off, but the old dam remained uncaught. She had damaged her foot in a trap, so that her track could be recognised in the snow, and yet all attempts to destroy her proved in vain.

At last, in 1743, Putnam, having lost seventy of his sheep and goats, determined to pursue the wolf until he finished her. He tracked her to the Connecticut River, and then back to Pomfret, and up to a hole in a huge ledge of rock which led down to a cavern. The entrance into this cavern was by an oblique path for fifteen feet, then along a horizontal fissure for ten feet, and then up along a fifteen-feet incline, till the chamber was reached. In no place was the passage more than a yard wide, or high enough for a man to stand upright in.

When the wolf was tracked home her siege began. Dogs were sent in, but they came out in terror. Straw was burnt, brimstone was burnt, all to no purpose. At last Putnam resolved to go in himself and tackle the wolf. He took off his shoes and stockings, tied a rope to his leg, and, with a piece of birch-bark as a torch, crept down the slope, along the level, and up into the cavern. He saw the eyeballs of the wolf glaring angrily in the light of his torch, and heard her gnashing her teeth and grunting at being disturbed. He pulled the rope, and his friends thinking something had gone wrong, hauled him out with a run. His shirt was torn to tatters, and he was much bruised. But he loaded his gun with buckshot, and for the second time entered the cave. Again he saw the wolf, and as she crouched to spring he fired. Stunned by the explosion, and almost suffocated with the smoke, he was again drawn out by the rope tied to his leg. After a few minutes he again entered the cave, and, feeling the wolf's nose, found that she was dead. He then seized her by the ears and dragged her after him as he was drawn out by his companions.

GAS FOR THE FIRESIDE.

THERE are two very simple ways of making lighting gas on a small scale.

For the first take an ordinary clay pipe—that known as a churchwarden is the best—and fill its bowl with some small pieces of coal. Cover the top with clay so as to prevent the coal coming into direct contact with the flame, and then insert it into the fire, leaving the stem sticking out. In a few minutes the gas will stream out of the mouth-piece, and on applying a light will give a steady brilliant flame.

This is the old way; the new way is very much more effective as a lecture experiment, but not quite as safe for an ordinary operator. There is, however, no danger if the experiment is performed over an iron tea-tray or other incombustible.

Take a piece of packing paper and twist it into a cone, as shown in the illustration. Towards the end make a large pinhole. Hold the paper in the left hand and light the open end. The heat developed by the flame produces a distillation of the organic matter of which the paper is composed, and the gas thus formed rushes out through the pinhole, where it can be lighted in the same way as that which streams from the tobacco pipe.

The experiment is a startling one; unfortunately it does not last very long. The light should be applied to the gas as soon as

the mouth of the paper is in flames, and the arm should be kept rather farther away from it than the artist in his desire for effect has thought fit to show in our illustration!

THE "BOY'S OWN" GORDON MEMORIAL FUND.

(Continued from page 511.)

SINCE our last week's number went to press we have received many congratulations on having taken in hand the "Boy's Own" Memorial. In a message from her home at Southampton, Miss Gordon herself says:—

"She hopes very much that the Boys' Memorial will succeed: it has her best wishes. A Home for poor boys is what would be most in accordance with General Gordon's desires."

Then, some one having expressed a fear lest Gordon's fame should induce warlike sentiments in our boys—and there are some good people who never by any chance do anything in the world but express fears and otherwise distribute wet blankets—one of the leading religious journals replies that though possibly there may be some slight danger in this direction, there is happily a more than usually bright "other side." The writer then continues:—"With such a war prevailing as that in the Soudan, and with the leading dailies and illustrated papers full of the exciting details, our British boys must have altered very much in their nature of late years if, copying their elders, they are not more or less affected with the 'war fever' and military hero-worship; and it is a happy thing, therefore, that the leading figure of the campaign should be a Gordon, whose genius was not simply that of a soldier, whose vocabulary seemed quite devoid of the words 'glory' and 'prestige,' and whose ambitions all must admit were neither social nor professional, but rather in the direction of a whole-hearted devotion to duty—and duty, too, as understood and translated into action by the earnest prayerful Christian. We have had such examples before—and are proud of them—in Lawrence and Havelock, in Goodenough and Hedley Vears; but such stars of the services are none so plentiful as to cause us to slight, or omit to utilise as a most powerful teaching force, the pre-eminent qualities of Chinese Gordon."

Rev. B. G. Johns, M.A., of the Southwark Blind School, sends us a poem on Gordon,

entitled "Too Late." We have space for but a few lines:—

His name lives written in ten thousand hearts;
It lingers in the prayers, at eventide,
Of little children, ere they say "Good night;"
Brings broken tears of joy to weary eyes,
Wherever falls the cloud of grief or pain.
They hear his voice, they see him as of old;
To them he is not dead—he cannot die.
By every sweet and tender memory he lives;—
And secret benedictions crown his grave,
Whether he lies unburied on the sand,
Or, hidden, rests far down the ancient river's bed;
There still he lives, beyond the desert waste,
The Soldier, Saint—the man who walked with God!
Who passed into the fight, unarmed, 'mid foes
Of deadliest hate, and swayed the mingled host
By the one power, supreme, of living Faith.

As we mentioned last week, we shall now be glad to receive donations with all convenient speed. All receipts will be duly acknowledged in our columns. Collecting Cards may now be had, but many readers may prefer to give right out rather than collect. All should endeavour to do something, however small. Girl readers, of whom we rejoice to have many, may of course also assist.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

II.—Illumination Competition.

It will be seen by reference to page 15 of the present volume that we wrote as follows:—

"We offer Three Prizes, of Two Guineas, One Guinea and a Half, and One Guinea respectively, for the best Illumination (in oils or water-colours) of a Bible promise, which may be selected, at the option of the competitors, from either the Old or the New Testament. Competitors will be divided into three classes, according to age, and one Prize will be awarded in each class. First class, from 18 to 24; second class, from 14 to 18; third class, all ages up to 14. The highest Prize will go to the class showing the greatest merit. Competitors are not prohibited from using purchased designs, but the colouring must be wholly their own, and, other things being equal, the preference will be given to original work throughout. The

size, material, etc., are left to the choice of competitors."

Our Award is as follows:—

JUNIOR DIVISION (all ages up to 14).

Prize—One Guinea.

HAROLD E. SPEED (aged 12), 26, Loughborough Park, Brixton, S.W.

Certificates.

EDWARD TYMMS, 8, Pittville Street, Cheltenham.
WILLIAM MARTIN, 35, Broughton Street, Queen's Road, Battersea.
F. A. OLDAKER, Worples Road, Epsom.
C. L. A. SEARCH, Holmesdale House, Reigate, Surrey.
JOHN L. MORRES, 42, Bartholomew Road, Kentish Town, N.
FRED ARNOLD, Mount Avenue, Jersey.
DAVID R. DRYDEN, 10, Lawton Street, Newcastle-on-Tyne.
THOMAS MARTIN, 15, South Street, Greenwich.
CLIFFORD CRAWFORD, 21, Windsor Street, Edinburgh.
LOUIS R. DEUCHARS, Auchterarder, Perthshire.
LOVELL E. WILLIAMS, 25, Moorland View, Ben Rhedding, *via* Leeds.
W. H. CULLIS, 98, London Road, Worcester.
THEODORE A. MINOPRIO, Grosvenor House, Aigburth Drive, Sefton Park, Liverpool.
R. S. FRANKS, Queen Street, Coatham, Redcar, Yorks.
HUGH P. MITCHELL, Easthill, Oakleigh Park, Whetstone, N.
HUBERT J. PAYNE, 9, Eastbourne Road, Trowbridge, Wiltshire.
ERNEST P. BROOKES, Upper School, Kingscliffe, Northants.
FREDERICK PATERSON, 5, Clarence Terrace, St. Luke's, Cork.
BOB GRAHAM, Mount Avenue, Jersey.
THEODOR MARTIN MÜLLER, High Street, East Grinstead, Sussex.
F. J. GROOM, 49, Baxter Road, Essex Road, Islington.
DUDLEY C. HARGREAVES, 4, Belmont Road, Broadstairs.
E. J. GREENE, 3, Charlwood Place, Pimlico, S.W.
G. H. WAYMARK, 13, Darville Road, Stoke Newington.
DELAMOTTE EDWARDS, Cricket Field Lodge, Hampstead Lane, Highgate.
GEORGE MEEK, 3, Church Street, Harpurhey, Manchester.
OSWALD C. JONES, 2, College Hill, Shrewsbury.
RONALD RUTTER, Head Street, Halstead, Essex.
G. H. ROBBINS, 19, Dalberg Road, Brixton, S.W.
ALLAN WARNER, 71, St. George's Square, Pimlico.

B. A. G.—1. Lieutenant Lockwood, in the Greely Expedition, is said to have reached lat. 83° 24', long. 40° 46'. This means a hundred miles more of the Greenland coast line than was seen by Lieutenant Beaumont in the Nares Expedition. 2. Roraima is the mountain in British Guiana, or rather on the borders thereof. It is a flat-topped pillar of sandstone, with an almost perpendicular face near the summit of nearly two thousand feet.

GRAVER.—Your best plan is to become apprenticed to a wood engraver, and secure a position on one of the illustrated papers. You will hardly make a fortune at the art.

LEPIDOPTERA.—"Entomology for the Month" was in the third volume. "Entomological Localities near London" in the fourth.

ANGLER.—The "Saturday Half Holiday Guide" is published by Bemrose, Old Bailey. It costs three-pence.

AN EXPLORER can refer to the index for the fifth volume, and find therein the article on Cricket Bats, which he has overlooked. See pages 606 and 622.

E. J. SCAMMELL.—Quite a mistake. Charles the Great, whom the French call Charlemagne, was a German, wrote German, and spoke German. There was no such kingdom as France in those days. The names are those of the principal chiefs of the Franks, and are of no historical importance. They vary in every book. You have been misled by some old-fashioned work; the whole history of the period has been revised. You will never meet with such a question in a public examination.

D. W. O.—You are in error in supposing that people in London know everything. Get rid of the notion that every one is watching you or taking the slightest interest in your dress or idiosyncrasies, and your shyness will soon evaporate. No man who is conscious of his unimportance can be "a bore in the social sphere."

VICTOR OLIVER.—You are not the first that has been influenced by the moon. "As I am very much in love with a young lady whose name is Diana, can you kindly inform me how I can gain her affections?" Well—keep your distance, and never say die. Tell her you have written to us for advice!

DOVECOT.—Paint the calico with boiled linseed oil. When it is dry give it a second coat.

VIOLIN.—No varnish can be made without a gentle heat. The directions are all tested and approved, so that you have only to follow them carefully. Other readers have written to inform us of their success.

L. H.—1. The magazine you mention has been defunct for some time. 2. A small printing-press, to be of any use, would not cost less than five pounds. 3. One of the stamps was Hungarian, the other German.

YOUNGSTER.—A reminiscence of barber-surgery. The barber's pole is the staff that used to be grasped by the patient before he was bled. The red-and-white stripes are the ribbons that used to bind up the wound.

N. MICHAELIS (Paris).—1. There was an article on Revolving Slides for the Magic Lantern in the part for October, 1883. 2. The volumes cost seven shillings and sixpence each.

W. B. W.—We had articles on bird-cage making in the parts for March and April, 1883.

F. RADFORD (Montreal).—1. We are glad to hear that the Boy's Own Penny Whistle "plays splendidly," but we cannot spare space for another key-board just yet. Try and make one according to the instructions; there is nothing very difficult about it. 2. We gave the management of the light in the first volume, but shall soon give an article on how to make it.

A NEW ZEALAND FOOTBALLER.—We know of no club with the tartan colours you mention. There is a Football Annual published at one shilling, giving most of the club colours and addresses. You can get it through Simpkin, Marshall, and Co., or Messrs. Robertson.

M. LONG.—You have been working in a pit of boulder clay, and the fossils are derivative. There are no ammonites in rocks above the chalk.

A WOULD-BE ATHLETE should read our articles on training in the second volume.

TIMON.—Too many queries by a long way. We cannot fill this page with detailed references to articles that have appeared. Buy the indexes and look up the subjects for yourself.

CATHAY.—By Cathay the Elizabethans meant China, or rather Tartary; of the native name of which, Khitai, Cathay is a corruption.

A. B. C.—Christmas in Australia comes in the height of summer, the seasons south of the equator being the reverse of ours.

REGREDDERE NE PROGREDERE.—The "Bazaar, or Exchange and Mart," is published at 170, Strand. Its price is twopenny. It is obtainable at all the principal railway bookstalls.

M. F.—Collect your plants when dry. Press them between sheets of absorbent paper, and warm them thoroughly when under pressure, and you will find the colours last for years.

A. E. W.—We had eight articles on Lawn Tennis in the fourth volume. Refer back, as we cannot again take up the subject—at least for some time.

J. BUNNINGTON.—The quotation is a libel, ingeniously worded so as to avoid prosecution. Our coloured plates take over a year in preparation, so that the thing is impossible to begin with. The statement is of course untrue—but it is characteristic of the class of literature to which such rubbish belongs.

NEMO ALIAS NULLUS should invest in the current quarterly Navy List, and study the circulars for himself. It is published by Murray, Albemarle Street, W.

J. H. H.—We do not know what you mean by a "copy of a deed." If you want a copy of a will you apply to the Probate Department at Somerset House. If you mean a copy of a conveyance you must get permission from its present holder.

THE JOLLY JACK TAR.—Boys who go to sea before the mast have to pay no premium.

G. S. B.—The sixteenth, seventeenth, and eighteenth numbers were in the June part for 1879.

A. W. H.—A sequel is a continuation, a parody, a burlesque. "The Cryptogram" is the sequel to "The Giant Raft." "The Teashop" in the last February part is a parody on "The Charge of the Light Brigade."

P. W. H.—All the packets of plates are kept in print.

BONNIE DUNDEE.—We have already given the various tartans. The Highland Clans formed the frontispiece of our fifth volume.

RUMBO.—For how marbles are made see the July part for 1883.

HUMOR.—Artemus Ward is the assumed name of Charles F. Browne; Aunt Fanny of Mrs. F. D. Gage; Barry Gray of Robert B. Coffin; Hosea Biglow of James Russell Lowell; Josh Billings of Henry W. Shaw; Bob Short of A. B. Longstreet; Hans Breitmann of C. G. Leland; Vandyke Brown of W. P. Brannan; Ned Buntline of E. Z. Judson; Christopher Caustic of T. G. Fessenden; Laura Caxton of Lizzie B. Comries; Geoffrey Crayon of Washington Irving; Porte Crayon of D. P. Strother; Shirley Dare of Susan Dunning; Q. K. Philander Doesticks of M. N. Thompson; Dunn Brown of Samuel Fiske; Edmund Kirke of J. R. Gilmore; Elizabeth Wetherell of Susan Warner; Ethan Spike of M. F. Whittier; Fanny Fern of Sarah Parton; Fanny Fielding of Mary Upshur; Fanny Forester of Emily Judson; Fat Contributor of A. M. Griswold; Florence Leigh of Anna T. Wilbur; Tom Folio of J. E. Babson; Francis Oldys of George Chalmers; Frank Forrester of W. H. Herbert; Howard Glyndon of Laura Reddon; Grace Greenwood of Sarah Lippincott; Major Jack Downing of Seba Smith; Orpheus C. Kerr of R. H. Newell; Mark Twain of Samuel L. Clemens; J. K. Marvell of Donald Mitchell; Petroleum V. Nasby of David R. Locke; Oliver Optic of W. T. Adams; Mrs. Partington of B. P. Shillaber; Peter Schlemihl of George Wood; Poor Richard of Benjamin Franklin; Sam Slick of T. C. Haliburton; Timothy Titcomb of J. G. Holland.

INKPOT.—To re-magnetise a magnet scrape it from north to south from the centre with the north pole of another magnet, and then scrape it from south to north from the centre with the south pole of your other magnet.

A VOLUNTEER ARTILLERYMAN.—The rearrangement of buttons on army tunics was for the sake of economy. It was an experiment, and proved a failure. At the same time the gold stripes were taken off the left arm.

G. A. J. FRASER (Canada).—Our arrangements are made so far in advance that the story would be useless to us.

BOY READER.—You will find articles on the Royal Standard in the parts for March, 1881, and October, 1883.

F. S. J.—In Lloyd's Register of British Shipping you will find full particulars of all our merchant ships, with the names of their owners, builders, captains, etc., etc.

F. WELCH.—The set would come cheaper in volumes if procured through one of the discount booksellers. The first and second volumes are not now kept in part form.

T. LINTON.—See answer to FLORIAN in last week's number (No. 330, May 9th, 1885). The list of independence battles is as follows: 1775—April 19, Lexington (if it is worth while calling it a battle); June 17, Bunker's Hill, won by British; December 31, Quebec, won by British. 1776—August 27, Long Island, won by British; October 28, White Plains; December 26, Trenton, won by Americans. 1777—January 3, Princeton, won by Americans; August 16, Bannington, won by Americans; September 11, Brandywine, won by British; September 19, Bemis Heights; October 4, Germantown, won by British; October 7, Saratoga, won by Americans. 1778—June 28, Monmouth, won by Americans. 1780—August 16, Camden, won by British; October 7, King's Mountain, won by Americans. 1781—January 17, Cowpens, won by Americans; September 8, Eutaw Springs, won by Americans; October 19, Surrender of Yorktown. We have given this from an American book, in order that you may hear the other side. Where the result is not stated the battle is claimed as drawn. At the same time most of these fights were British successes, and most of the American victories were mere outpost affairs. In the pitched battles the British won, and the war only came to an end on account of France and Spain joining in the fray, and the electorate of this country failing to see what good could be obtained by its continuance. The colonists could have been annihilated, but what then?

A READER.—Get the September and October parts for 1881. You will find therein a long series of articles on making model engines.

E. G. W.—According to some authorities, the old English "Nowell" is a contraction of "nouvelles" or tidings.

TOMAHAWK.—1. Christmas is the old feast of Yule. 2. If you mean the genus Camel, you can have as many humps as you please. If you mean the species Camel, you have two humps. The confusion arises from both camels and dromedaries belonging to the genus Camelus. The camel=Camelus bactrianus, and has two humps; the dromedary=Camelus dromedarius, and has but one.

PURPLE MADDER.—The articles on Painting were in the May, July, and September parts for 1881.

MONTHLY SUBSCRIBER.—The Marquess of Salisbury is descended from the eldest son of Cecil, Lord Burleigh, of the Elizabethan days. The battle of Crevant was in 1423.

No. 332.—Vol. VII.

SATURDAY, MAY 23, 1885.

Price One Penny.

REGINALD CRUDEN: A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER VIII.—MR. DURFY GIVES REGINALD A TESTIMONIAL.

"The Wilderham Captain sent him sprawling."

REGINALD CRUDEN was a young man who took life hard and seriously. He was not brilliant—indeed, he was not clever. He lacked both the good sense and the good humour which would have enabled him, like Horace, to accept and make the best of his present lot. He felt aggrieved by the family calamity, and just enough ashamed of his poverty to make him touchy and intractable to a

degree which, as we have seen already, amounted sometimes almost to stupidity.

Still Reginald was honest. He made no pretence of enjoying life when he did not enjoy it. He disliked Mr. Durfy, and therefore he flared up if Mr. Durfy so much as looked at him. He liked young Gedge, and therefore it was impossible to leave the youngster to his fate and let him ruin himself without an effort to rescue.

It is one thing to snatch a heedless one from under the hoofs of a cab-horse and another to pick him up from the slippery path of vice and set him firmly on his feet. Reginald had thought nothing of the one, but he looked forward with considerable trepidation to meeting the boy next morning and attempting the other.

Gedge was there when he arrived, working very basily, and looking rather troubled. He flushed up as Reginald approached, and put down his composing-stick to shake hands with him. Reginald looked and felt by a long way the more uncomfortable and guilty of the two, and he was at least thankful that Gedge spared him the trouble of beginning.

"Oh! Cruden," said the boy, "I know exactly what you're going to say. You're going to tell me you're deceived in me, and that I'm a young fool and going to the dogs as hard as I can. I don't wonder you think so."

"I wasn't going to say that," said Reginald. "I was going to ask you how you were."

"Oh, I'm all right; but I know you're going to lecture me, Cruden, and I'm sure you may. There's nothing you can say I don't deserve. I only wish I could make you believe I'll never be such a fool again. I've been making resolutions all night, and now you've come here I'm sure I shall be able to break it off. If you will only stand by me, Cruden! I owe you such a lot. If you only knew how grateful I was!"

"Perhaps we'd better not talk about it now," said Reginald, feeling very uncomfortable and rather disconcerted at this glib flow of penitence.

But young Gedge was full of it yet, and went on,

"I'm going to turn over a new leaf this very day, Cruden. I've told the errand-boy he's not to get me any beer, and I'm determined next time that beast Durfy asks me to go—"

"What!" exclaimed Reginald; "was it with him you used to go?"

"Yes. I know you'll think all the worse of me for it, after the blackguard way he's got on to you. You see, before you came I didn't like—that is, I couldn't well refuse him; he'd have made it so hot for me here. I fancy he found out I had some pocket-money of my own, for he generally picked on me to come and have drinks with him, and of course I had to pay. Why, only last night—look out, here he comes!"

Sure enough he was, and in his usual amiable frame of mind.

"Oh, there you are, are you?" he said to Reginald, with a sneer. "Do you know where the lower-case 'x' is now, eh?"

Reginald, swelling with the indignation Gedge's story had roused in him, turned his back and made no answer.

Nothing, as he might have known by this time, could have irritated Mr. Durfy more.

"Look here, young gentleman," said the latter, coming close up to Reginald's side and hissing the words very disagreeably in his ear, "when I ask a question in this shop I expect to get an answer; mind that. And what's more, I'll have one, or you leave this place in five minutes. Come, now, give me a lower-case 'x.'"

Reginald hesitated a moment. Suppose Mr. Durfy had it in him to be as good as his word. What then about young Gedge?

He picked up an "x" sullenly, and tossed it at the overseer's feet.

"That's not giving it to me," said the latter, with a sneer of triumph already on his face. "Pick it up directly, do you hear? and give it to me."

Reginald stood and glared first at Mr. Durfy, then at the type.

Yesterday he would have defiantly told him to pick it up himself, caring little what the cost might be. But things had changed since then. Humiliating as it was to own it, he could not afford to be turned off. His pride could not afford it, his care for young Gedge could not afford it, the slender family purse could not afford it. Why ever did he not think of it all before and spare himself this double indignity?

With a groan which represented as much inward misery and humiliation as could well be compressed into a single action, he stooped down and picked up the type and handed it to Mr. Durfy.

It was well for him he did not raise his eyes to see the smile with which that gentleman received it.

"Next time it'll save you trouble to do what you're told at once, Mr. Puppy," he said. "Get on with your work, and don't let me catch you idling your time any more."

And he walked off crowned with victory and as happy in his mind as if he had just heard of the decease of his enemy the manager.

It was a bad beginning to the day for Reginald. He had come to work that morning in a virtuous frame of mind, determined, if possible, to do his duty peaceably and to hold out a helping hand to young Gedge. It was hard enough now to think of anything but his own indignities and the wretch to whom he owed them.

He turned to his work almost viciously, and for an hour buried himself in it, without saying a word or lifting his eyes from his case. Then young Gedge, stealing a nervous glance at his face, ventured to say,

"I say, Cruden, I wish I could stand things like you. I don't know what I should have done if that blackguard had treated me like that."

"What's the use?" said Reginald. "He wants to get rid of me, and I'm not going to let him."

"I'm jolly glad of it for my sake. I wish I could pay him out for you."

"So you can."

"How?"

"Next time he wants you to go and drink, say no," said Reginald.

"Upon my word I will," said Gedge; "and I don't care how hot he makes it for me, if you stick by me, Cruden."

"You know I'll stick by you, young un," said Reginald; "but that won't do you much good, unless you stick by yourself. Suppose Durfy managed to get rid of me after all—"

"Then I should go to—to the dogs," said Gedge, emphatically.

"You're a greater fool than I took you for, then," said Reginald. "If you only knew," he added more gently, "what a job it is to do what's right myself, and how often I don't do it, you'd see it's no use expecting me to be good for you and myself both."

"What on earth am I to do, then? I'm certain I can't keep square myself; I never could. Who's to look after me if you don't?"

Like a brave man, Reginald, shy and reserved as he was, told him.

I need not repeat what was said that morning over the type cases. It was not a sermon, nor a catechism; only a few stammering laboured words spoken by a boy who felt himself half a hypocrite as he said them, and who yet, for the affection he bore his friend, had the courage to go through with a task which cost him twenty times the effort of rescuing the boy yesterday from his bodily peril.

Little good, you will say, such a sermon from such a perverse, bad-humoured preacher as Reginald Cruden, could do! Very likely, reader; but, after all, who are you or I to say so? Had any one told Reginald a week ago what would be taking place to-day he would have coloured up indignantly and hoped he was not quite such a prig as all that. As it was, when it was all over, it was with no self-satisfied smile or inward gratulation that he returned to his work, but rather with the nervous uncomfortable misgivings of one who says to himself,

"After all I may have done more harm than good."

* * * *

By the end of a fortnight Reginald, greatly to Mr. Durfy's dissatisfaction, was an accomplished compositor. He could set up almost as quickly as Gedge, and his "proofs" showed far fewer corrections. Moreover, as he was punctual in his hours, and diligent at his work, it was extremely difficult for the overseer or any one else to find any pretext for abusing him.

It is true, Mr. Barber, who had not yet given up the idea of asserting his moral and intellectual superiority, continued by the ingenious device of "squabbling" his case, and tampering with the screw of his composing-stick, and other such pleasing jokes not unknown to printers, to disconcert the new beginner on one or two occasions. But ever since Reginald one morning, catching him in the act of mixing up his e's with his a's, had carried him by the collar of his coat and the belt of his breeches to the water-tank and dipped his head therein three times with no interval for refreshment between, Mr. Barber had moderated his attentions and become less exuberant in his humour.

With the exception of Gedge, now his fast ally, Reginald's other fellow-workmen concerned themselves very little with his proceedings. One or two, indeed, noticing his proficiency, hinted to him that he was a fool to work for the wages he was getting, and some went so far as to say he had no right to do so, and had better join the Chapel to save trouble.

What the "chapel" was Reginald did not trouble even to inquire, and replied

courtly that it was no business of any one else what his wages were.

"Wasn't it?" said the deputation. "What was to become of them if fellows did their work for half wages, they should like to know."

"Are you going off, or must I make you?" demanded Reginald, feeling he had had enough of it.

And the deputation, remembering Barber's head and the water tank, withdrew, very much perplexed what to do to uphold the dignity of the "chapel."

They decided to keep their "eye" on him, and as they were able to do this at a distance, Reginald had no objection at all to their decision.

He meanwhile was keeping his eye on Gedge and Mr. Durfy, and about a fortnight after his arrival at the "Rocket" a passage of arms occurred which, slight as it was, had a serious influence on the future of all three parties concerned.

The seven o'clock bell had rung, and this being one of Horace's late evenings Reginald proposed to Gedge to stroll home with him and call and see Mrs. Cruden.

The boy accepted readily, and the two were starting off arm in arm when Mr. Durfy confronted them. Reginald, who had never met his adversary beyond the precincts of the "Rocket" before, did not for a moment recognise the vulgar, loudly dressed little man, sucking his big cigar and wearing his pot hat ostentatiously on one side; but when he did he turned contemptuously aside and said,

"Come on, young un."

"Come on, young un!" echoed Mr. Durfy, taking his cigar from his mouth and flicking the ashes in Reginald's direction, "that's just what I was going to say. Young Gedge, you're coming with me to-night. I've got orders for the 'Alhambra,' my boy, and supper afterwards."

"Thank you," said Gedge, rather uncomfortably, "it's very kind of you, Mr. Durfy, but I've promised Cruden to go with him."

"Promised Cruden! what do you mean? Cruden'll keep till to-morrow, the orders won't."

"I'm afraid I can't," said Gedge.

"Afraid! I tell you I don't mean to stand here all night begging you. Just come along and no more nonsense. We'll have a night of it."

"You must excuse me," said the boy, torn between Reginald on the one hand and the fear of offending Durfy on the other.

The latter began to take in the position of affairs, and his temper evaporated accordingly.

"I won't excuse you, that's all about it," he said; "let go that snivelling lout's arm and do what you're told. Let the boy alone, do you hear?" added he, addressing Reginald, "and take yourself off. Come along, Gedge."

"Gedge is not going with you," said Reginald, keeping the boy's arm in his, "he's coming with me, aren't you, young un?"

The boy pressed his arm gratefully, but made no reply.

This was all Mr. Durfy wanted to fill up the vials of his wrath.

"You miserable young hound you," said he, with an oath, "let go the boy this moment or I'll turn you out of the place—and him too."

Reginald made no reply. His face was

pale, but he kept the boy's arm still fast in his own.

"Going with you, indeed?" shouted Mr. Durfy, "going with you, is he, to learn how to cant and sing psalms! Not if I know it—or if he does, you and he and your brother and your old fool of a mother—"

Mr. Durfy never got to the end of that sentence. A blow straight from the shoulder of the Wilderham captain sent him sprawling on the pavement before the word was well out of his mouth.

It had come now. It had been bound to come sooner or later, and Reginald as he drew the boy's arm once more under his own felt almost a sense of relief as he stood and watched Mr. Durfy slowly pick himself up and collect his scattered wardrobe.

It was some time before the operation was complete, and even then Mr. Durfy's powers of speech had not returned. With a malignant scowl he stepped up to his enemy and hissed the one menace,

"All right!" and then walked away.

Reginald waited till he had disappeared round the corner, and then turning to his companion took a long breath and said,

"Come along, young un, it can't be helped."

The reader must forgive me if I ask him to leave the two lads to walk to Dull Street by themselves, while he accompanies me in the wake of the outraged and mud-stained Mr. Durfy.

That gentleman was far more wounded in his mind than in his person. He may have been knocked down before in his life, but he had never, as far as he could recollect, been quite so summarily routed by a boy half his age earning only eighteen shillings a week! And the conviction that some people would think he had only got his deserts in what he had suffered, pained him very much indeed.

He did not go to the "Alhambra." His clothes were too dirty, and his spirits were far too low. He did, in the thriftiness of his soul, attempt to sell his orders in the crowd at the theatre door. But no one rose to the bait, so he had to put them back in his pocket on the chance of being able to "doctor up" the date and crush in with them some other day. Then he mooned listlessly up and down the streets for an hour till his clothes were dry, and then turned into a public-house to get a brush down and while away another hour.

Still the vision of Reginald standing where he had last seen him with young Gedge at his side haunted him and spoiled his pleasure. He wandered forth again, feeling quite lonely, and wishing some one or something would turn up to comfort him. Nor was he disappointed.

"The very chap," said a voice suddenly at his side when he was beginning to despair of any diversion.

"So it is. How are you, my man? We were talking of you not two minutes ago."

Durfy pulled up and found himself confronted by two gentlemen, one about forty and the other a fashionable young man of twenty-five.

"How are you, Mr. Medlock?" said he to the elder in as familiar a tone as he could assume; "glad to see you, sir. How are you too, Mr. Shanklin, pretty well?"

"Pretty fair," said Mr. Shanklin. "Come and have a drink, Durfy. You

look all in the blues. Gone in love, I suppose, eh? or been speculating on the Stock Exchange? You shouldn't, you know, a respectable man like you."

"He looks as if he'd been speculating in mud," said Mr. Medlock, pointing to the unfortunate overseer's collar and hat, which still bore traces of his recent calamity. "Never mind, we'll wash it off in the Bodega. Come along."

Durfy felt rather shy at first in his grand company, especially with the consciousness of his muddy collar. But after about half an hour in the Bodega he recovered his self-possession, and felt himself at home.

"By the way," said Mr. Medlock, filling up his visitor's glass, "last time we saw you you did us nicely over that tip for the Park Races, my boy! If Alf and I hadn't been hedged close up we should have lost a pot of money."

"I'm very sorry," said Durfy. "You see, another telegram came after the one I showed you that I never saw; that's how it happened. I really did my best for you."

"But it's a bad job, if we pay you to get hold of the 'Rocket's' telegrams and then lose our money over it," said Mr. Medlock. "Never mind this time, but you'd better look a little sharper, my boy. There's the Brummagem Cup next week, you know, and we shall want to know the latest scratches on the night before. It'll be worth a fiver to you if you work it well, Durfy. Fill up your glass."

Mr. Durfy obeyed, glad enough to turn the conversation from the miscarriage of his last attempt to filch his employers' telegrams for the benefit of his betting friends' and his own pocket.

"By the way," said Mr. Shanklin, presently, "Moses and I have got a little Company on hand just now, Durfy; what do you think of that?"

"A company?" said Mr. Durfy; "I'll wager it's not a limited one if you're at the bottom of it! What's your little game now?"

"It's a little idea of Alf's," said Mr. Medlock, whose Christian name was Moses, "and it ought to come off too. This is something the way of it. Suppose you were a young greenhorn, Durfy—which I'm afraid you aren't—and saw an advertisement in the 'Rocket' saying you could make two hundred and fifty pounds a year easy without interfering with your business, eh? what would you do?"

"If I was a greenhorn," said Durfy, "I'd answer the advertisement and enclose a stamped envelope for a reply."

"To be sure you would! And the reply would be, we'd like to have a look at you, and if you looked as green as we took you for, we'd ask for a deposit, and then allow you to sell wines and cigars and that sort of fancy goods to your friends. You'd sell a dozen of port at sixty shillings, do you see; half the cash down and half on delivery. We'd send your friend a dozen at twelve and six, and if he didn't shell out the other thirty bob on delivery we'd still have the thirty bob he paid down to cover our loss. Do you twig?"

Durfy laughed. "Do you dream all these things?" he said, "or how do you ever think of them?"

"Genius, my boy; genius," said Mr. Medlock. "Of course," he added, "it couldn't run for long, but we might give it a turn for a month or two."

"The worst of it is," put in Mr. Shanklin, "it's a ticklish sort of business that some people are uncommon sharp at smelling out; one has to be very careful. There's the advertisement, for instance. You'll have to smuggle it into the 'Rocket,' my boy; it wouldn't do for the governors to see it, they'd be up to it. But they'd never see it after it was in, and the 'Rocket's' just the paper for us."

"I'll try and manage that," said Durfy. "You give it me, and I'll stick it in with a batch of others somehow."

"Alf thinks we'd better do the thing from Liverpool," continued Mr. Medlock, "and all we want is a good secretary—a nice, green, innocent, stupid, honest young fellow—that's what we want. If we could pick up one of that sort there's no doubt of the thing working."

Mr. Durfy started and coloured up, and then looked first at Mr. Medlock and then at Mr. Shanklin.

"What's the matter? Do you think you'd suit the place?" asked the former, with a laugh.

"No; but I know who will!"

"You do! Who?"

"A young puppy under me at the 'Rocket,'" said Durfy, excitedly; "the very man to a T!" and he thereupon launched into a description of Reginald's character in a way which showed that not only was he a shrewd observer of human nature in his way, but, when it served his purpose, could see the good even in a man he hated.

"I tell you," said he, "he's born for you if you can only get him! And if you don't think so after what I've said,

perhaps you'll believe me when I tell you, on the quiet, he knocked me down in the gutter this very evening because I wanted to carry off a young convert of his to make a night of it at the Alhambra. There, what do you think of that? I wouldn't tell tales of myself like that for fun, I can tell you!"

"There's no mistake about that being the sort of chap we want," said Mr. Medlock.

"If only we can get hold of him," said Mr. Shanklin.

"Leave that to me," said Mr. Durfy; "only if he comes to you never say a word about me, or he'll shy off."

Whereupon these three guileless friends finished their glasses and separated in great good spirits and mutual admiration.

(To be continued.)

DISGRACED BY A MAGPIE.

PART II.

MOST of the speech recorded in our last chapter the doctor muttered to himself as he advanced to the bell-rope. He walked with his back towards the door, and as he did so my old friend Jack the magpie came hop-hop-hopping in, and his thievish eye at once fell upon the silver specs which the enraged man had laid down on the very spot on the table where before he had laid the case which had so disgraced me in his eyes.

Jack quietly hopped upon his old quarters in the arm-chair and as quickly possessed himself of the envied trophy, and I became the innocent witness of another theft much greater than the last.

Deeper disgrace to me, I thought; but as the doctor was evidently sure I was the culprit, and was not likely to accept any explanation from me, I thought it best to keep quiet, though by this I no doubt made myself Jack's accessory.

A servant answered the bell, and he was requested to send my father hither, and, of course, my father came.

"Well, doctor, what can I have the pleasure of doing for you?" he inquired. "You appear agitated—what is the matter?"

"Nothing very serious, sir, but at the same time very annoying," replied the doctor.

My father looked at me, and the expression of my countenance satisfied him that there was some fun about, and that the doctor was the victim of it. My father was as fond of harmless sport as myself, and it was that which so much endeared him to me and the young generally.

"I shall have much pleasure in helping you out of your difficulty," said my father to his visitor, "if you will let me know what it is."

"The difficulty rests with Master Charles, who has been letting off upon me a little holiday legerdemain," replied the doctor, who had grown a trifle pleasanter in his manner since the entrance of my father.

"Explain, my son; for although you are home for the holidays, I shall not tolerate any liberties being taken with your seniors."

"I am not conscious of having done so, papa," I replied.

"My spectacle case, Master Charles, where is it?" inquired the doctor.

"Come, sir, what about this case?" asked my father, authoritatively.

"I have not got it, papa, and so I have repeatedly told Dr. Millbank."

"Look here, sir, if you please," said the doctor to my father. "I laid my spectacle case on the table where you see my glasses," and here he pointed to the table, and my father looked on the spot indicated, and said,

"Where, doctor, where? I see no glasses."

We were all standing some distance from the table, and the doctor could not see what was on it—he only spoke from the knowledge that he had placed his spectacles on the table, to which he now drew near, when, to his great surprise, and to my greater amusement, he made the same discovery that my father had done, that there were no glasses there.

"Why, sir, not five minutes ago I laid my glasses on this spot!" he exclaimed, giving the table rather a loud rap with his knuckles, which did not harm the table, though it did the knuckles, as the doctor's screwed-up face indicated. "There, sir, exactly there—and now you see with your own eyes that both case and spectacles are gone!"

"I see, doctor, that they are not now on the table," said my father. "Are you quite sure you placed them there?"

"Will you kindly take my word for it, Mr. Mitford?" answered the perplexed doctor.

"Both eyes and memory, doctor, you will allow, are sometimes treacherous."

"Not in this case, sir, believe me," replied the doctor, controlling his rising temper as much as possible.

"I saw them there, papa," I said.

"Why, of course you did, Master Charles," returned the doctor, in tones and looks that plainly indicated that I had been little rogue enough to have moved them. "And no one has been in the room but you—eh, Charles?"

"I won't say that, sir," I replied; "but I do say that I have neither laid my hands on the case nor spectacles."

"Well, well, of course I must believe you, Charles," returned the doctor, but

any one might have seen that he had his doubts about that matter.

"It is a very mysterious occurrence, Dr. Millbank," remarked my father.

"I cannot say that I see any mystery about it, sir; I am no believer in spiritualism, but I am in logic. I laid the spectacles and case there on that table, and your son saw that I did. They are now gone—no one has been in the room but Master Charles."

"Ergo, Master Charles must have them," interrupted my father. "That is the true inference of your logic. But my boy, Dr. Millbank, has a great regard for truth, which I never knew him to dishonour; and when he tells you that he has not got the case or spectacles, you may safely rely on what he says."

"No doubt of it, Mr. Mitford," replied the doctor, who was evidently convinced against his will. "Boys, you know, sir, home for the holidays are capable of obtaining a great deal of amusement at the expense of others."

"I see, sir, you still think my son is the culprit."

"My dear Mr. Mitford, not for the world would I say so. Master Charles is a youth that I have a great regard for, and when he says that he has not got the missing articles, I am bound to believe him. But boys home for the holidays—but there, I have said all that before. We must put it all down, I suppose, amongst the thousand and one mysteries that are said to surround us. But I am not a believer in mysteries, but a strong one in cause and effect. Spectacles and case could not be taken from the table without hands."

"That is still a poke at Master Charles," said my father, who was very gentle with his learned visitor.

"No offence to Master Charles, sir, I do assure you," said the doctor. "But it is very mysterious, is it not, Mr. Mitford?"

"Very—no doubt of it, sir. And I quite agree with you that the things, if they were placed there—"

"Which they were, Mr. Mitford, and Master Charles saw them too," interrupted the doctor.

"Well, then," continued my father, "it is impossible that they could have been

moved without hands. Now some one else might have been in the room besides Charles—

"But no one, my dear sir, that would have taken such a liberty," again interrupted Dr. Millbank.

"That has to be discovered, sir. Every member of the house shall be examined before you," said my father, quite in earnest.

"I beg that you will take no such trouble, sir."

But my father would have his way, and summoned all the servants and family to the library, and on the occurrence being related to them they each and all declared that they had not that morning been in the library, and took their departure in rank and file from the apartment, but scarcely able to conceal their laughter, which did not at all serve to appease the doctor's displeasure.

After they had left, another visitor came hopping into the room—no less than my father's favourite, Jack, the magpie. My father was now seated by the side of the doctor, and the bird, as was his custom, hopped and flew to his shoulder, which was his favourite perch when he had the opportunity.

"Well, pa," said the cunning bird, bending his head and beak to my parent's face.

"And what do you want, Master Jack?"

"Pooh, pooh!" said the magpie, which was another daily phrase of his which he had picked up. Then he pretended to be sleepy, winking and blinking, and even yawning, and crying, "Poor Jack! poor Jack!"

"A fine rare bird, Mr. Mitford, is your magpie," said the doctor, who would not have said so much had he known, as I did, that Jack was the author of his misery.

"He is a very troublesome old fellow, aren't you, Jack?" said my father, flipping him on his long beak.

"Pooh, pooh!" cried the bird, fluttering his wings—"pooh, pooh!"

"By-the-by," cried my father, "I wonder if the magpie has taken the things from the table?"

"Pooh, pooh!" cried the bird, while the doctor mentally cried the same.

"Bright things have great attraction for magpies," said Mr. Mitford.

"But my spectacle-case doesn't happen to be bright; it is blue morocco leather."

"Tell the truth!" I said, catching the bird up by his tail, much to his displeasure. "What have you done with the spectacles?"

"Pooh, pooh!" screamed the bird, making divers pecks at my hands, which made me restore him to his perch on my father's shoulder.

"Well, Mr. Mitford, I must go now whether I get my glasses or not," said the offended doctor; "but I might as well be without my head as my spectacles!"

"I am indeed sorry for the occurrence," rejoined my father.

"And so am I," I said, "for I still fear Dr. Millbank thinks I have got them."

"It must be somebody, Master Charles, must it not?"

"Depend upon it, my friend," said my father, "it is the magpie who is the thief."

"Easier said than proved, dear sir," replied the doctor. "I know this, however, that I would not keep a bird capable of such thefts. But I am surprised, Mr.

Mitford, that you should suggest such a solution of the mystery. It is quite a vulgar error to suppose that magpies are thieves of anything but that which contributes to their sustenance."

"Keep Jack for a day or two and try it," said my father, laughing.

"There is no inducement, sir, since you give them such a bad character," said the doctor; "I am fond of all birds, too," he added.

"We have lost several articles," continued my father.

"But how lost, Mr. Mitford? The bird cannot swallow them!"

"No; but Jack has an appetite for thieving, or appropriating things to hide or bury."

"I have read as much, but put it all down as fables invented to please children. Besides, dear sir, who would keep birds to be robbed by them?"

"There is good and evil in everything. Jack is an amusing companion at times, but nevertheless he is a great thief."

"Pooh, pooh!" croaked the bird, as if he understood the passing conversation.

"I quite agree with the bird's remark," said the doctor, much amused that Jack so aptly replied to my father. "It is a fact easily demonstrated. If a magpie will take one bright thing he will take another. There is a silver pencil-case," said the incredulous doctor, placing it on the table, when, to his great surprise, the bird, that had hitherto been immovable, hopped from my father's shoulder to the arm-chair. "Now, sir, if the bird took my glasses, and if it is his nature to steal, he will soon possess himself of the pencil-case."

"Not when he is observed, perhaps. Jack, like human thieves, doesn't like his evil propensities to be seen."

"Then let us all three retire and leave the magpie with the pencil-case. What then?"

"Why, that when we return you will find the bird and the case both flown."

"A bargain, sir!" said the doctor, quite pleased that he should soon have the satisfaction of proving my father in the wrong.

We all retired to the dining-room, and had a little agreeable talk about magpies, and the plot that had been laid to discover whether Jack was a thief or not.

An hour later I asked whether I should go and look after the bird and the case.

"No, thanks, Master Charles," said the doctor, "I object to that; you are home for the holidays. We will all go together when your father is prepared."

"I am quite ready, sir."

So we all three went to the library and to the table. Bird and pencil-case had vanished! The doctor was astonished; I and my father were not, but laughed to each other at the doctor's expression of surprise.

"What do you say now, doctor?" quizzed my delighted parent.

"That they are gone!" he replied.

"It could not be by 'the boy home for the holidays,' now, could it?"

"But the bird, sir—where is the bird?" exclaimed the doctor, who fairly felt himself in a dilemma.

"Gone to his storehouse," replied my father.

"But where is that?"

"I have not been able to discover."

"Have you taken any means to do so?"

"I have not. Can you suggest any?" inquired my father.

"Watch him," was the laconic but sensible reply.

"But the cunning fellow has committed his depredations when he has not been seen."

"Plant some temptation for him, as now, and then place three or four persons to watch where he takes it."

"A very good idea, and I will follow it out now, if you please."

"I should like very much, for my curiosity is now deeply excited. Ah! Master Charles, you are a boy of an excellent temper to bear so well as you have done with my petulance and hasty conclusions."

"I am glad, sir, that you have discovered it was not 'the boy home for the holidays' that took your spectacles," I said, smiling.

"Now I will place my gold pencil-case on the spot where you placed your silver one, and then wait the return of the sly old bird."

This was done, and it was not many minutes before the bird entered, no doubt to see if there were any more bright things to be taken away. What! another pencil-case for Jack! No one was in the room but the doctor, who this time pretended to be deeply engaged in a book, as I had before done, while I and my father planted ourselves in unseen places outside the room. The bird was not slow in accomplishing his theft, and as quickly hopped out of the library with the pencil-case.

"Seeing is believing!" exclaimed the doctor, closing the book with a loud bang. "I wouldn't keep a magpie for the world."

Then he made his way to the courtyard, where I and my father had stationed ourselves. We had not been long here before the bird came hopping along with the pencil-case in his beak, and he flew to the top of a loft.

The doctor's countenance expressed indescribable surprise, while I and my father laughed heartily as Jack flew up to his hiding-place. But we had sense enough to wait before Jack flew down again before we mounted a ladder for the loft lest we frightened the marauder before he had deposited his new treasure.

With a croaking cry, Jack flew over our heads, and descended at a glass door which led into the hall. Directly he was out of sight we all ascended the ladder, and when we had got to the roof, there, in a leaden valley between two angles, we discovered a hoard of bright things, amongst others the cases and spectacles belonging to Dr. Millbank!

The articles that the bird had purloined and hidden here were almost too numerous to mention; there were two silver thimbles of mamma's, a shilling, a half-crown, two silver spoons, tinfoil, brass buttons, etc., etc., the whole in a scooped-out pit, as well as the place would admit, and covered over with a little mould and leaves.

"What do you say now, doctor?" triumphantly asked my father, extending his hands over the magpie's storehouse and handing him back his property.

"That I will never keep a magpie," he returned, shaking his head, placing his hands behind the tail of his long clerical-cut coat, and blushing and laughing.

During a little conversation between

us on the top of the loft the saucy bird returned, looking unutterable things and screaming when he saw us there and his hoard disturbed.

When the doctor held up his glasses and was about to admonish him the bird turned tail upon us and flew off, croaking "Pooh! pooh!" and we did not see him for two days afterwards. He was evidently deeply offended; indeed, Jack was not the same bird afterwards, and was even cold and indifferent to the caress of my father; as for "Master Charles," he dare not touch Jack's tail.

On taking his departure, the doctor, smiling good-naturedly, remarked,

"I assure you, Mr. Mitford, until now I set down all these wonderful stories of animals that we meet with as fabulous. But your bird, sir, has taught me a wholesome lesson, that things may nevertheless be true, whether we believe them or not; and, further, I have had a warning not to be too hasty in coming to conclusions with boys home for the holidays upon circumstantial evidence; and, still further, that as long as I wear spectacles I will never keep a magpie."

We each and all had a hearty laugh, a shake of the hand, and the doctor took his departure.

OUR NOTE BOOK.

CHARACTER.

The word "character" is derived from a Greek verb that means "to cut into furrows, to engrave." Letters, figures, or signs were called "characters," because of their being engraved. Whatever is written upon the heart makes the man what he is, and is manifest in outward expression. Considering how ineradicable it all is, how careless boys are as to what is written upon their inner being, and how often the devil is allowed to hold the graving-tool!

WHAT WOULD MOTHER SAY.

Do you ever dare, when alone, or with one or two companions, to do anything you would be ashamed to do in your mother's presence? Look honestly into the matter. Remember that God is now searching you through—that you cannot dare dissemble with Him—that He is reading your inmost soul as clearly as you can read an open book.

The boy who has a pure and true idea of reverence for his mother is never left to himself. Her presence occupies a chamber in his heart. He bears her remembrance about

with him—as the high priest bore about with him the remembrance of the people by the engraved gems of his breastplate. In moments of privacy, in the time of temptation, when some evil thought has arisen, some wicked word has been spoken, some sinful action has been suggested—if a boy reverences his mother, her sacred presence rises before him, and in the strength of her remembrance there comes the preventing power of the Holy Spirit; and he has courage to resist the devil, and comes out of the temptation with unsullied conscience.—*Rev. A. N. Malan, M.A.*

A BOY WANTED.

I saw a bill, says a writer, in a window, the other day, with the heading, "A Boy Wanted," which set me to thinking. Two Scripture texts came into my mind in connection with it, and they were these: "No man can serve two masters,"—"Choose you this day whom ye will serve." Listen to the words of the Son of God—He who has proved His deep love for sinners by giving up His life's blood on Calvary: "Come unto Me, all ye that labour and are heavy laden, and I will give you rest;" "Him that cometh unto Me I will in no wise cast out." "A Boy Wanted" by Jesus, and each of you whom I am addressing is he to whom these words apply.

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER VII.—LIEUTENANT MILDMAI.

THE funeral-bell was tolling on board the *Theodora* next day, and the Service for the Dead, which never sounds more impressive than at sea, was being read in slow and solemn tones by the clergyman: "Earth to earth, and dust to dust." At these words the grating on which it lies is tipped, and with sullen plunge the body sinks into the depth of the ocean.

The service is concluded; then the hands are piped down and go forward or below to their work and duties, but more slowly and more quietly than is their wont at most times. Is it grief for Fred Adams, the young A.B. who has just found rest in a mariner's grave, that keeps them so still? No; for few knew him, and only one on board had been "shipmates" with Fred before; that was a first-class boy. Yonder he is, weeping bitterly beside a gun. Every one respects his grief, but no one attempts to console or comfort him. He will get well ere long. Fred's "traps" will be sold in the ship by auction; then Fred himself will pass away from the thoughts of all on board. But there may be some little cottage, some hamlet in England, where a mother or a sister dwells, and in their minds the memory of this humble sailor will be green for ever.

A deeper sorrow than that for the drowned sailor has spread itself over the ship. Lieutenant Mildmay lay in his cot, so weak, so ill, so feeble, that the surgeon could give but little hopes of

his life. Many of the crew had been under this officer before, and the way they talked of him to their messmates proved how much they loved and respected him. But even to those who had not sailed with him previously Mr. Mildmay had already endeared himself. They could see he was a strict officer, but a kind-hearted man, a genuine gentleman and sailor.

All that day Mildmay seemed hovering betwixt death and life. He spoke towards evening, but only in a husky whisper. The doctor was with him almost constantly, and whenever he entered the ward-room he was eagerly questioned about the state of his patient, and his replies were listened to, and his very looks as he made them noted by even the mess-servants, and these were speedily reported and commented on in the steerage, the engine-room, on deck, and even in the gully.

The *Theodora* held on her course, and shortly after passing the Cape de Verdes fell in with the trade winds. One afternoon, about ten days after the fatal accident had taken place, Dr. McGee, the surgeon, called Colin on deck.

"My patient, poor Mildmay," he said, abruptly, "wants to see you."

"Wants to see me?" replied Colin, in some surprise.

"Yes, he wants to see you. Have you known him or sailed with him before?"

"No, never. I never saw Mr. Mild-

may until I came on board the *Theodora*."

"Well," said the surgeon, "I may as well tell you that he has been raving somewhat, and it is just possible he mistakes you for some one else. But he is sensible enough at present. You know Mr. Mildmay's cabin? Very well; go to him, but, mind, don't stop a moment longer than you can help, as talking may excite him too much."

"Not," added the surgeon, as if speaking to himself, "that it makes a very great deal of difference."

Colin stopped a moment, then said, "Oh, sir, pardon me, but you speak as though there were no hopes of your patient. He has been so kind to me. I hope you do not think he will die."

"Look here, young gentleman," said McGee, brusquely, "I shan't let you go down below there at all unless you can manage to pull a more cheerful face. So there! As to Mildmay's dying or living I can say little. Come, I don't want to talk unkindly to you. You are a terribly nervous chap, but screw up your courage and look happy, whether you feel so or not."

The ship was gently swinging to and fro on the waves, but moderately steady withal. Colin paused before Mildmay's curtained door, but at that moment the ship gave an extra roll to windward, and the drapery swung aside and revealed his presence.

"Come in, McLeod," said a faint voice.

Mildmay lay in his cot with his long grey hair floating back over the snowy pillows, and with his hands clasped and lying outside the coverlet. It was an easy, even happy attitude. He moved his face towards Colin and smiled; then he beckoned him to a chair close by the cot, so situated that the two were face to face. There was a hectic flush on each of Mildmay's cheek-bones, and his eyes were more sparkling than usual, otherwise few could have said he was ill.

"Dr. McGee," he said, "is one of the best fellows in the world, and one of the best meaning, but he has got an idea into that old Scotch noddle of his that I am about to lose the number of my mess."

"I'm glad to hear you talk so cheerfully," said Colin, smiling.

"I know you are, boy," said Mildmay. "There is that in your face which tells me you are sincere. Now raise my shoulders a little, and put that extra pillow which you see on the chair yonder under my head. You have no idea how feeble I am!"

The poor lieutenant *was* feeble, and talked very feebly too, with many a pause and catch of the breath.

"May I give you anything, sir?"

"A little wine-and-water. Thank you. Now tell the sentry to allow no one to come near this cabin-door until you leave."

Colin did as he was told, and returned as quickly and as quietly as he could.

Mildmay seemed to have fallen asleep, but so still did he lie, and so inaudible was his breathing, that Colin after a short time grew alarmed, and laid his hand on the lieutenant's wrist. How cold and clammy it felt! But Mildmay opened his eyes at once.

"I was thinking," he said, "I was away back again in the distant past. Colin McLeod, it is a long, long time since I was a boy like yourself, but still it seems but like a dream of yesterday."

Colin made no reply, and after a short pause Mr. Mildmay went on.

"Now," he said, with that sad smile of his, "disabuse your mind of the notion that I am never going to leave this cot alive, because I know and I *feel* that I shall be on duty again long before we are at the Cape. But there is always a chance of a sick man taking a turn for the worse, so on that account I have made up my mind to tell you something which otherwise you would probably never have known. What I am about to tell you is the romance of my own life. I tell it to you, Colin, because I knew your uncle."

"My uncle, sir? My uncle, Captain Peter?"

"Your uncle, Captain Peter. One of the best and bravest men that ever trod on a quarterdeck."

"You know him, then, sir?"

"Know him? Ay, ay, I know him, and knew him long before Colin McLeod was born. I served with him when I was only a mite of a middy. That was in times of peace; and I served with him when a junior lieutenant, he being my captain. That was in the stirring days of the Crimean war, Colin. I was young then, but even the rattle of the drum that now summons us to quarters fires my blood. I have but to close my eyes for a moment, and the old days come back again."

"You love war, then, sir?"

"Not for itself, Colin McLeod, not

even for the excitement of the battle, not for the blood and the carnage, but for the virtues it causes to shine forth in the breast of every man who is a man. Ah! Colin, war is a great leveller, it fills up the valleys and it brings the mountains low."

"I must not keep you talking, sir."

"Colin McLeod, our good surgeon, McGee, put that notion in your head. 'Don't excite old Mildmay,' he said; but I brought you here to talk to you, and I mean to do so as much as I please, in spite of our worthy medico, who seems not to know that to lie and think the thoughts one cannot speak is far more exciting and debilitating than talking can possibly be."

"It is sad to think of the slain in war," said Colin.

"Oh, boy, yes; but this world is full of pain and sorrow; pain in peace as well as pain in war. What says the goody Bishop Porteous?"

"War its thousands slays,
But Peace its thousands ten."

Mr. Mildmay paused for a moment, then recommenced abruptly.

"Did your good uncle never tell you of the fierce fight in which he lost his leg?"

"Long, long ago," replied Colin, "I remember his describing something of it to my mother; and now, strange to say, sir, it begins to dawn upon me that he must have mentioned your name more than once, though I took little notice. You were nothing to me then, sir."

Mildmay seemed intensely pleased, for he put out his hand and pressed Colin's.

"What you have told me," he said, "is better far than anything our surgeon has given me since I have been laid low. No, your uncle was never a man to boast, but a braver deed has seldom if ever been done—a braver action never fought at sea—than the capture and defeat of those two Russian ships-of-war by the old Bellona, commanded by your gallant Uncle Peter. We were coasting along the shores of the Black Sea, in company with a French frigate, when on rounding a point we came suddenly in sight of two monster Russians, bearing down upon us with all sail set. We beat to quarters at once—we were always ready—and so also did the Frenchman, and in less than fifteen minutes the first shot was fired. It seemed to be an understood thing betwixt the foe and us that we should fight ship to ship. But, both in guns and tonnage, to say nothing of men, those Russians were twice as powerful as we were."

"Your uncle, Colin McLeod, appeared to think we were too near the shore for a free fight, so we stood out to sea, the Russians following with precisely the same sails that we carried. They wanted to test their sailing power as against our own. In this respect, too—much, no doubt, to their own satisfaction—they proved our superiors."

"But," continued the lieutenant, leaning now on his elbow, as if the subject had given him fresh strength, "there was one thing in which the foe was not our superior—in the prowess of her men; they possessed not the indomitable courage and cool skill of ours. Ah, boy! whenever you hear or read of foreign powers counting or reckoning up our naval strength by the number of ships

and guns in our dockyards, just smile to yourself, for ten to one they will forget that every man in our fleet is a sailor born and bred, with the blood of the ancient vikings in his veins, and descended from a race that has been mistress of the seas for hundreds of years."

"But the battle, sir," said Colin, who was not unmindful of the surgeon's warning. "How did it end?"

"As battles 'twixt the Briton and the Russ always did end," said Mr. Mildmay. "It was a fierce and terrible fight, though. Alas! for the poor Frenchman, the struggle had not lasted more than half an hour before, high over the thunder of our own guns and those of the enemy we were engaging, rose the roar of a terrible explosion, an immense canopy of smoke and flames filled the air, mingled with masses of splintered masts and timbers. The Frenchman had sunk, and to the assistance of the poor men who floated around the spot where she had gone down the dastardly enemy never sent a single boat. She began to bear down on us, however, though crippled in her bowsprit and with her foremast gone by the board."

"Your uncle saw his chance, and although his sails were riddled with shot and his rigging cut about, his spars and yard arms were almost intact. With one parting volley at the ship he had been fighting he ran down to meet the other. The old Bellona seemed that day to sail like a witch."

"'We'll rake her!' cried your uncle to his first lieutenant; 'then stand by to lower boats and pick up our French friends.'"

"The enemy saw the manœuvre, but was in too crippled a condition to prevent its complete success. We poured our whole broadside into her stern as we swept past. The wind caught the smoke and revealed her upper decks immediately after. It was a sickening sight. The other mast tottered and fell, the wheel was blown to atoms, and bridge and boats were in splinters. The Frenchman was revenged."

"Before the other Russian could get near us we had picked up nearly thirty of our friends, and had the boats hoisted inboard again. Then the battle recommenced 'twixt ship and ship, for the crippled Russian made straight for the beach in a sinking condition, leaving her sister ship to give a good account of us if she could. Had your uncle, Colin, commanded that great line-of-battle ship, with her armament and powers of sailing, instead of the smaller and more slow Bellona, the fight would not have raged so long as it did."

"Quick as she was, and well manned, the enemy failed in every attempt to rake our craft; then she lay broadside on to us, and the force of her fire was terrific. We soon had several of our guns rendered useless, and had hardly men enough left to man the rest. Our crowning disaster, however, was when our maintopmast was splintered by a shot, and came slowly crashing down."

"Almost at the same moment, Colin, a shot tore through your poor brave uncle's leg, and he fell on the bridge. Rayson, the first lieutenant, and the surgeon himself, were by his side in a moment, and would have had him carried below."

"Tourniquet, doctor, tourniquet!" was all he muttered; but the instrument

was speedily applied, and the bleeding stopped.

"Rayson," he cried, hurriedly, gasping out the words, "run us alongside! Board her, cutlass in hand, in the good old fashion; it is our only chance!"

"One last broadside was fired, then, to the surprise of the Russians—who now looked upon us as a prize, and who were shouting with joy and mad with glee—the *Bellona* forged ahead right down on them. It was man to man then, Colin, and British cutlass to Russian pike and pistol.

"I boarded at the bows, and with my fellows around me fought aft towards the waist of the ship. We cheered as we clambered on board in spite of the fierce resistance we met, but once on that blood-drenched deck there was no more cheering, but instead only the clashing of steel, the ring, ring, ringing of pistols, and then—why then it was all over; the foe in their hurry to escape had even torn up the gratings off the hatches and thrown themselves below pell-mell.

"We were victors, Colin."

"And my uncle?"

"It was no land, but a bank of dense fog, and hardly were we into it ere it blew almost a hurricane, and we were laid on our beam ends. We righted, but with the loss of a spar that had been splintered in the engagement and afterwards spliced.

"We never saw the *Bellona* again. But, alas! for the fortunes of war, next

comes my own little romance. Every life, Colin, has its romance. I've had mine. It was a dream while it lasted, but it has gone, and it can never return. I must be brief, for I fain would sleep."

"Some other time, sir, perhaps."

Lieutenant Mildmay seemed to start.

"No, boy, no," he said, "there is no time like the present.

"I was marched a prisoner of war into the interior. I shall not tell you of the sufferings I endured on the road; suffice it to say that after a long and weary journey of over a week we found ourselves, I and my men—or the few of them that had not been killed by the way—"

"Killed!"

"Ay, boy, killed by their brutal escort. We found ourselves in a lovely little village that nestled among trees near a wide and beautiful lake. There was here a small fort or castle, and the commandant visited us.

"He was not only civil, he was even kind. I hesitated to give my parole, but he pleaded with me to do so. If I did he told me I might go where I liked, and be his guest frequently, and my life would be as happy as it was possible to make that of a prisoner of war.

"I took his advice, and was, comparatively speaking, free. I was billeted at

the most charming cottage in all the village. 'They are foreigners like yourself,' said the commandant, who talked excellent English, 'and with them you are sure to be comfortable.'

"The cottage stood on an eminence embowered in trees and covered with creepers that trailed around gables, porch, and verandah. There was a green lawn sloping down to the lake where a little boat lay moored, and all around the house were acres on acres of rose-trees, the perfume from which on this sweet summer's evening was delightful in the extreme. As the commandant and I walked together up the gravel pathway the sound of music—a girlish voice singing to a harp—came through the open window and fell on my ear.

"I looked towards my companion.

"'It is Annette,' he said, 'little Annette. You will like her. But don't fall in love, you know,' he added, smiling.

"'I don't think it is likely,' I replied, with a light laugh.

"How little I knew what was before me!"

(To be continued.)

"We cheered as we clambered on board."

"He had never left the bridge, although the surgeon tried to force him below. I was the first to return to him. 'I feel the pain now,' he said, 'but we are victorious, this is a glorious hour!'

"The brave man spoke no more for days. I took charge of the captured man-o'-war, and we made sail for Scutari.

"About the third day—for we were detained by boisterous head winds—our look-out reported land on the lee bow.

morning we fell in with a Russian frigate. It is needless to say that we became an easy prey to her; we had not men enough to fight even a gunboat. I was a prisoner of war."

Lieutenant Mildmay stopped speaking, and lay back on the pillows.

"You are exhausted, sir," said Colin.

He pressed Colin's hand again, then closed his eyes again as if resting.

"I was a prisoner of war," he said again presently. "And now, dear boy,

CHAPTER I.—GOING ASTRAY.

It was a hot day in summer, so hot that even the birds seemed to feel it, and had hidden themselves in the shade of the thickest-leaved trees, or perhaps in the ivy on some crumbling old walls—somewhere, at any rate, where the sun's rays could not beat so fiercely. The grass here and there looked dry and

burnt up, and curious little crawling insects were scrambling through it, busy and lively in the heat which exhausted other creatures. The sky had not a cloud, and the trees stood motionless, not a bough nor a twig moving in the still air.

The place we are looking at is a long

high road, coming down a hill in one direction, and going up a hill in the other—just the sort of white, dusty road which seems so tiresome when one has a long hot walk before one. To the left there are some trees and the roof of a lodge, and opening out of the fence are gates, showing the entrance to a house.

As we look through the gates, the eye is refreshed by the sight of tall shadowy trees and green cool grass; while the drive, as it curves away out of sight, is flecked here and there with the bright sunshine.

Everything is very quiet here in the depths of the country; only now and then through the silence comes some sound or inarticulate cry from a distance, showing that life is stirring somewhere out of sight.

But, listen! Is that a footstep? A footstep, or rather the steps of two people coming down the drive, and nearing us very slowly. Just at the turn they come into sight—two boys, one about thirteen, the other looking a couple of years younger. Sauntering along, and deep in talk, they are evidently in no hurry; but the sound of their voices rings through the still air, and as they draw nearer their words become audible.

"Father says he thinks we shall like him," the younger boy was saying. "He said he had heard he was nice enough, didn't he, Jack?"

"Yes; but a fellow who has been in India all his life must be rather different. I dare say he won't care for anything that we like. I wonder his father didn't send him home before."

"Mother told me the other day that after Uncle Henry's wife died he could not bear to part with this boy Tom, as he was his only child. So he took him about with him everywhere, and only sent him home at last because he found that he was getting spoilt."

"So he is to stay here for the rest of the holidays, and go back to school with us! I wonder how he will like it? How I should hate to be going for the first time at twelve years old—wouldn't you, Bertie?"

"I should think so! Particularly if he doesn't know much, and can't take a good place. We shall have to look after him."

"I hope he won't be a muff, and will be able to take care of himself," said Jack, going out on the road and looking along it. "I say, how hot it is! This will remind Tom of India. I suppose he will find it quite cool while we are frizzling."

Bertie laughed. He was standing with both hands shading his eyes, looking away into the distance.

"I think I can see something coming down that second rise," he said, "but it may be some farmer's trap. Just wait a minute. All right!" he shouted, after a little. "I can make out the dog-cart now," and, putting his fingers in his mouth, he blew a shrill whistle.

"Humbug!" said Jack. "Do you think they can hear that from where they are?"

Bertie did not seem to hear. He was standing watching the approaching vehicle, with a broad grin of expectation on his face. Just then a shrill bark came from the distance; and, with a scuttling of eager feet, a little fox-terrier dashed down the drive and leapt in wild excitement on the boys.

"Oh, get down!" said Jack, pushing the dog away. "Snap, old fellow, that whistle wasn't meant for you. I declare he makes one hotter than ever."

"Doesn't he?" said Bertie; "but here comes the cart. What is he like? You speak to him first."

"How are you, Tom?" said Jack, advancing and holding out his hand. "Pull up a minute, Jones! Look here, would you like to get down now and walk up to the house with us? This is my brother Bertie. I am Jack, you know. I suppose you have heard all about us. I'm so glad you've come. All right; go on, Jones."

As the new comer jumped down from his high seat, the three boys stood still for a minute and looked at each other. Jack was secretly disgusted to find that, though a year younger, his cousin had slightly the advantage of him in height, and involuntarily squared his shoulders as he compared his sturdy build with the other's slight figure. Bertie in the meantime was gazing with blank surprise at patent leather boots, gloved hands, and clothes such as do not generally grace the form of the British schoolboy, and was just going to indulge in an ironical whistle when, remembering himself in time, he plunged both hands into his pockets instead.

As for Tom, his quick, restless eyes were roving everywhere. He had smiled when first meeting his cousins, but now his face had settled into a weary, impatient expression, which seemed habitual to it. He looked pale and dark beside the light-haired, sunburnt English lads; but he held himself very erect, and had an air of condescension which brought an amused smile to Jack's good-tempered face. As they all turned to walk up the drive together some remarks were made upon Tom's journey, which broke the silence; and by the time they arrived at the broad sweep in front of the house the boys were all in eager and engrossing conversation.

The little terrier in the meantime had been hunting diligently, quite oblivious of the heat and of an occasional call from one of the boys. Now he appeared, carrying something in his mouth, with an important air.

"It is only a stone," explained Bertie. "That is a trick of Snap's, and we could never break him of it."

"Do you mean to say that you allow him? Why, he will break all his teeth!" said Tom, going up to the dog and trying to take away the stone.

Instantly the terrier turned and seized the boy's sleeve between his teeth, and in the same moment, as it seemed, the dog was shaken off and was limping away with a severe kick on the shoulder.

Bertie's face was full of consternation. He looked at Jack, who, flushing scarlet, had walked after the dog. "Oh, I say, Tom!" he said; "what made you do that? That's Jack's dog, and he won't let any one touch him."

"The little brute turned upon me!" said Tom, angrily.

"I know; but, you see, he thought you were a stranger, and he is so old I don't think he could have hurt you. But never mind. Would you like to go in now and see the house and our father and mother? and then we can come out again when it is cooler."

The house into which the boys have disappeared is a fine old place, and has belonged to the Stanton family for many generations. On one side runs a moat, which, in front of the house, has been transformed into a sunk fence, separating the lawn from the park. There is a curious old walled garden not far off where the fruit hangs heavily on the

trees; and there are cool shrubberies behind the house, and many sheltered flower-bordered walks, where the late blossoms will linger till nearly Christmas.

Near enough to hear the lowing of the cows and the shrill crow of some triumphant cock the home-farm begins—a source of never-ending interest to the boys, for there they keep their pets, and there, among the men, they have many fast friends, to whom the return of the boys for the holidays is an ever-welcome event.

If we turn now and enter the house by the open door a grateful sense of coolness strikes us as we cross the wide hall, hung round with horns, stags' heads, and dark old pictures. In front of us we can see a brook oak staircase; but we will turn here to the left into a room in which we can hear voices. Bertie and Tom are standing talking to a lady and gentleman, who are evidently Mr. and Mrs. Stanton. The new comer does not seem at all shy, and has plenty to say to the lady who is smiling at him so kindly. Bertie is begging his father to let them do something, at which Mr. Stanton shakes his head, but seems amused. Then the boys are sent off that Tom may get something to eat—an idea which is jumped at by Bertie, who declares that he is dying of hunger himself, having lunched considerably more than an hour ago.

Afterwards, when they came out again, they saw Jack standing not far from the house. He turned away his head as they approached, and continued speaking to the gardener as if unaware that they were so near.

Bertie made a face, and, drawing Tom aside, said, "I say, do you mind saying something to Jack about hurting Snap? I am afraid he is angry about it."

Looking very much surprised, his cousin broke out, "Well, I think it is I who ought to be angry! Am I to stand still quietly to be bitten by a dog?"

"Oh, he wouldn't really have bitten you," said Bertie, looking perplexed; and, seeing that Jack could hear, he added, rather weakly, "It is only his way."

Tom laughed. "Well, if that is his way, he will probably get punished again!"

Jack looked round. "You can leave the punishment to me another time," he said.

Getting very red, Tom burst out laughing again, and said, "What a fuss about a dog!"

Bertie, who had been looking at his brother rather anxiously, now asked quickly, "Shall we go somewhere?"

Jack looked rather doubtful for a minute before replying, "Yes. We can go to the stables. I dare say Tom would like to see the horses." Then, turning to his cousin, he said, "I can't bear to see animals knocked about. That is why I was put out just now, but of course you didn't know that Snap was such an old dog. Your father has a lot of horses in India, I suppose?"

This question brought out a flood of recollections and descriptions of life in the East. The boy seemed glad to be able to speak of it, and ended with,

"I wish I were out there now!"

"But your father will be coming home in a year or two, won't he?" asked Bertie, sympathetically.

"Yes; but it won't be the same in England—everything is different here. Now he is commissioner, and people think a great deal of him, but when he comes home he says he will be nothing, and just like every one else, and I shall hate that."

"Oh, you will get accustomed to it, and I am sure you will find England very jolly when you have been home a little time. Wasn't it very dull sometimes, having no brothers or fellows to knock about with?"

"There was always a regiment, so I had plenty of friends."

"Oh, well, this is the way down here. Our ponies are turned out; you can see them afterwards."

The old coachman met them as they entered the yard. He was always glad to see the boys when they had come to "behave themselves," as he said, and now he was particularly anxious to see the new comer, as he had known his father, whom he spoke of as "Mr. Henry," much to Louis's amusement. He took great pride in his horses, and as he

opened a door and several dark heads with glancing eyes and pointed ears were turned towards the light, he exclaimed,

"There, sir, I think we can show you one or two here as good as anything you have seen in India."

Tom's face lighted up and lost its listless expression as he went in among the horses, examining and admiring with a real knowledge and interest which went to the old man's heart. He had much to say on the comparative merits of the Arab horse, and made the other boys laugh with his stories of the stratagems to be employed in mounting a vicious country-bred pony, or the difficulties people had in speaking to each other when their horses were always ready to fight. He expressed a wish to try one or two of the horses, turning to the old servant with an air of command which seemed rather to perplex the autocrat of the stables.

Jack laughed.

"I know you may not have any of these without father's permission, but I dare say Richards can let you have

something, if you won't find it too hot to ride now."

Tom's face clouded, and he looked sullen and discontented as he said,

"I might have any horse of my father's that I liked. If I can't try these I don't care for any others, thank you."

"You see," said little Bertie, trying to improve matters, "things are so differently managed in England."

"Yes, I wish they weren't."

"But we have some good useful horses that you haven't seen yet, sir. Please to step this way."

Tom's interest, however, was not to be reawakened. He followed the coachman carelessly, and made no comment on the other contents of the stable, so that Jack soon proposed an adjournment.

The old man stood shaking his head as he watched the retreating figures of the three boys.

"Ah," he said, with a sigh, "I can see a look of his father in him now and again, but Mr. Henry never had ways like this one."

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy-Earl," etc.

CHAPTER XIX.—(continued.)

VAN saw that there were no pleasant thoughts passing in Mr. Smirnoff's mind, for his brow was clouded and his look was not the kind, open, frank look of a few hours back. As we have seen, he was not a stupid boy, though self-willed to an excess. He said no more about Siberia, but sought to draw Mr. Smirnoff's attention from a painful subject by directing it into an agreeable channel. He therefore showed him his German writing, which indeed had greatly improved.

This interested Smirnoff, who looked with pride and gratification at the well-written pages of the exercise book. So when the bell rang for lunch he went downstairs in high good-humour again.

Just as they were going into the dining-room together two visitors were announced—General Kakaroff and Tenterton. Smirnoff immediately left the room, giving orders to the servants to lay covers for two more. Ivan remained behind and begged the butler to let him, not Tenterton, have the foot of the table, and by dint of some coaxing the man consented. The dining table was arranged without the extra leaves, so that it was perfectly square, and the boy's object was to be near Kakaroff, not opposite him. By his management of the butler he now contrived to get the prefect on his left hand and Tenterton on his right.

When the gentlemen entered and lunch was served, conversation was general, and the boy was quiet. But an opportunity arose when Smirnoff applied to Tenterton for some information respecting English customs in regard to certain matters of commerce. Ivan bent over to Kakaroff and asked him how Madame Kakaroff was. Kakaroff, who always admired Ivan, and was greatly amused with his adventures, said,

"Thank you, she has not been quite well of late, but she often speaks of you. Why don't you come and see us now and then?"

"You must ask Mr. Smirnoff that question. I should only be too glad, I am sure. It is what I have been longing to do ever since I have been back, but I don't like to ask."

Hereupon Kakaroff turned to Smirnoff and said,

"My little friend Ivan has not been to see us for ages, and my wife is anxious to see the hero of two escapes; when will you let him come to us?"

"Whenever you feel disposed to be bothered with him," said Smirnoff, laughing.

"But I don't bother you, do I?" said Ivan.

"I fancy few people have ever bothered me so much! However, it is part of my business to be bothered, and, after all, I don't much mind Ivan, he contrives to make himself interesting and to group around him all sorts and conditions of men. Let me see," continued the prefect, looking at his memorandum book. "On Saturday we are free. I shall, with your permission, send a trusty driver with my own sledge and a mounted cossack, so that your *protégé* may be in perfect safety. I will send for him and send him back in safety at night."

"You will spoil him by making a lion of him before his time. But let it be as you wish."

The party broke up. Tenterton and Ivan took a walk on the boulevards, a very pleasant feature of Moscow. Kakaroff went to his bureau, or office as we should call it, to sign papers, and Smirnoff was engaged in conferences on foreign railway projects and other speculations.

On the Saturday the excitement of our little hero knew no bounds. Tatiana could not understand what was the matter with him.

"You must be fond of the police," she said, as she laid out for him some specially white fine linen and brand new garments which he insisted on wearing for the first time at the house of Kakaroff.

Ivan was duly fetched away by the

"swell" turn-out of the prefect, and attended by a tall cossack with a long lance, on a little horse like a pony, but with plenty of "go" in him; and very proud the boy felt tearing down the boulevard towards the palace inhabited by Kakaroff. Many mujiks took off their caps as he dashed past, and stood bowing till he was out of sight.

There had been some heavy falls of snow, and the clean white cover hiding the dirty and irregular pavement of Moscow, substituted uniform cleanliness, and made what Kakaroff called the Natural Railway of Russia. As the sledge neared the house the porters at the door gave notice to the gendarmes on duty within, one of whom came out to assist our hero to alight. As soon as he entered he was ushered upstairs to the upper hall, where servants were ready to relieve him of his schuba and goloshes, for no one in Russia goes out without goloshes, which are always left with the schuba and other wrappings in the vestibule or ante-chamber under charge of the schwitzar or swiss, who is responsible for their safety, and whose name recalls the ancient time when the trusty porter was a native of the land of upright minds and simple honesty.

We know the house of General Kakaroff, having already visited him several times. Ivan was shown into the crimson drawing-room, where, sitting on a circular settee in the centre, was the lady of the house, who received him most graciously.

"My dear young friend, what a long time it is since you were here, and in that time what fresh and exciting adventures you have passed through! And your adventures are so tragic, you cause people to be shot or otherwise slain, or else to be sent to Siberia, put into prison, and so forth! You are really 'Ivan the Terrible.'"

"Not so terrible to other people, your Excellency, as to myself. I am half afraid to go out for fear of running against some fresh adventure that may not turn out so well for me as the others have! But you spoke of Siberia. May I tell you a secret about something I am dying to do? I want it kept a secret, and I want you to help me."

"Tell me what it is, Ivan. I cannot promise to do anything in the dark, nor shall I promise secrecy any further than this. I will not betray you to anybody."

"That will do for the present."

Madame Kakaroff smiled at the offhand way of our hero, who, however, was perfectly respectful.

"Well, now, you must tell me what new pagan castle you intend to attack, only this time I hope you will not involve the general in personal conflict with brigands in cellars."

"I am coming to that—"

"Oh, then, stop; I won't have anything to do with it."

"You mistake what I mean. I say I am coming to it, not to him."

"That is another thing. Well, go on."

"You recollect Annie?"

"Of course I do. But it makes me wretched to think of her. I did my best to save her."

"I know you did, and now you must do your best to rescue her."

"I? Batuschka! What can I do?"

"I will tell you. I want you to get me leave to go to Siberia. I want you to find out where she is imprisoned, to get

my passports properly arranged, and to have a girl's passport which I have with me properly regulated for Siberia and back."

"Anything else? Why, Ivan, you take my breath away. Skobelev was a baby to you. He never would have dared to think of such a mad-brained escapade. What do you mean?"

"Why, of course I mean to go and fetch Annie."

"Well, you have excited my curiosity now; you must tell me the rest after dinner. I was going out, but I shall stay at home, and see nobody. Alexander, tell the people I am at home to nobody. Set tea for me and Ivan Ivanovitch in the white boudoir, and see there are writing materials."

"Directly, your High Excellency."

At this moment the general entered, and the little party of three went in to dinner, when Ivan kept his entertainers in wonderful spirits by a well-sustained series of imitations of the comical people he had met in his last adventure. He gave the old long-bearded rascal so well that Kakaroff declared he could almost see the beard. He gave the butcher and his apprentice with such a change in his voice that you might have sworn there were two people present in the performance. Both Kakaroff and his wife were more delighted than ever with Ivan, and as few people are more grateful for being amused than the Russians, the prefect and his wife each secretly resolved to help Ivan in every possible way. He was thinking of the Kiazan estates, and she was wondering how she could aid him in getting "to Siberia and back with a girl's passport."

Dinner was over, coffee was brought, and then Ivan was carried off by the lady of the house, while Kakaroff drove off to some people where there was a ball to be watched, as one of the English royal family was reported by the police to have accepted an invitation, and it was not a family of sufficient distinction to justify such an honour being either expected or conferred.

They were scarcely left alone when Madame Kakaroff invited Ivan to divulge his plan. When he had done she said, "Now, Ivan, your plan is most ingenious, most charming, but I fear only possible in a story-book. You have been reading the story of 'Elizabeth, or the Exiles of Siberia,' and here you are ready to brave the perils of a Russian winter over the trackless snow to find one who was kind to you and to pay a debt of gratitude. I will grant the motive to be noble, but I doubt the possibility of carrying out your plan. On the other hand, there are railways now. If it be carried out I should for one be delighted. But we must have the consent of Mr. Smirnoff and, if necessary, his aid."

"That," said Ivan, "is the greatest difficulty of all. I don't mind the wolves. If they eat me, why, all the better for the Abrazoffs. But asking Mr. Smirnoff for his consent is worse. I have faced one cannibal, and I really am not much afraid of the wolves, but I don't feel like asking for this permission where I know there will only be opposition. Do you know what I think? Look here! you ask him. That's the thing. You can turn anybody round your little finger, and you will manage Mr. Smirnoff splendidly. I mean to go, though perhaps I may have to wait for my own money to

come in, because my plan means money. There is only one obstacle, and that is the police-station on the frontier, and to the commandant of that station I must have a letter from the general directing him to be careful and considerate in dealing with the sick girl just crossing. I must have letters to the governor of Tobolsk and to the commandants of all the penal establishments to which Annie is likely to have been sent, and I must find out her number; I know that names are all abolished over there. It will be difficult, but as it is not very long since she went I do not despair of getting her out. But how to get the letters I don't know, unless you have them written and make one of the aides-de-camp submit them to the general with the usual batch of things to be signed in the regular course of official business. Or perhaps you can talk him over to helping me more directly. Anyhow, I can't do without your help."

"Then I understand you want me to talk over the general to anything I find feasible, and to use my powers of persuasion with Mr. Smirnoff."

"I don't think there is much more you can help me in besides those items. The money I can get, and all the rest I can manage of myself."

"Well, I think there is quite enough work cut out for me, Ivan; and if it had not been for Annie, to whom I have taken a violent fancy, I should have laughed at the whole scheme as a pack of boyish nonsense. You are a daring little fellow, but more than daring is wanting here. I don't know what to do. You must give me a night to think it over."

"Certainly, only there is very little time, and if you don't help me I must run away without your assistance, and that will be very difficult on account of my plan on the frontier. I shall be glad to see the Steinfeldts again; he was very kind to me, was Annie's uncle, and the aunt was a brick!"

"Well, Ivan, as your clever little brain has worked out all this, I think it would be a great hardship to you to act against you. How I can act for you I cannot tell, but I will see what I can do. If I find it possible for me to do as you wish I will write to Mr. Smirnoff and invite him to dinner on Tuesday next, and I shall also write to you at the same time asking you to send me 'Elizabeth, or the Exiles of Siberia,' and this you will understand to mean, 'I agree to the journey, and will help.' If, on the other hand, I send you a book—no matter what—then you will know that I cannot help you. Now, good-night; go to bed and dream of wolves and sledges, and all kinds of horrors! Good-night."

(To be continued.)

WORDS OF CHEER.

E. G. W. writes from Gateshead-on-Tyne: "I first got to know of the B. O. P. at school, about six years ago. The scholars wanting to have a boy's paper that they would be permitted to read, and that would really be worth reading, held a meeting, to which the master was invited. The B. O. P. was selected. The next thing we did was to vote in a treasurer to keep the books and money. There were over a hundred subscribers on the lists at first. Off all these papers we had 2½d. discount (a dozen), and at the end of the year we had a trip with the discount money, saved up for that purpose. The master found the paper so interesting and instructive that every Wednesday afternoon he allowed us to read out of the current number instead of our regular reading-book. For the last two and a half years I had the honour of being treasurer. The last year I was at school I proposed buying a new set of cricketing materials for the club instead of having a trip with the savings, and a splendid set we thus secured."

AN ARCTIC TRAGEDY.

"The same Wild Hummocks of Palæocrystic Ice."

IN our August part for 1883, when we told the story of Kane and Hayes and Hall and De Long, we pointed out the curious fate that seems ever to attend an American Arctic exploration. The expeditions all begin well, and all end miserably. To that rule the latest attempt to solve the Polar mystery was no exception. All went right with Lieutenant Greely to begin with, and then came the end in cannibalism. It is a sad story; let us glance at the work that was accomplished without unduly dwelling on the horrors that accompanied it.

The Greely expedition—twenty-four in number all told—was landed in Lady Franklin Sound on August 11, 1881. It was one of two expeditions dispatched by the United States Government in co-operation with the International Polar Committee to work out the weather and magnetic phenomena of the district. It was not an exploring expedition in the usual sense, for its duties necessitated its remaining in one spot, and any attempts at geographical discovery on the part of its members were purely voluntary. The other expedition, under Lieutenant Ray, entrusted with similar duties, was sent to Point Barrow in Northern Alaska, and did its work without loss. Lieutenant Greely and his men were taken north in the *Proteus*, a Scotch whaler, and without a check proceeded up Kennedy Channel to the point that had been fixed upon for their camp. The *Proteus* left them comfortably installed, with boats, a house, and provisions and stores for two years, at the end of which time they were to be relieved.

They were not relieved; the vessels sent to help them failed to get far enough north, and the retreat of the party ended in disaster. Greely's orders were to leave his camp not later than 1st of September, 1883, and it was expected that he would find a relief party at

Littleton Island. From July, 1882, to August, 1883, not less than fifty thousand rations were taken in the *Neptune*, *Yantic*, and *Proteus* up to or beyond this spot. Of this immense number only one thousand were landed. The rest, incredible as it may appear, were by a succession of blunders returned to the United States; and Greely was left to starve and find his way home unaided.

Before he commenced his retreat he had, however, done much exploring work which he was not expected to do. The camp was fixed where the *Discovery* had wintered in 1875, and from this point, called by the Americans Fort Conger, Lieutenant Lockwood had been dispatched north-eastwards in 1882, and south-westwards in 1883. He had made his way along the coast-line of the large island of Greenland until he had in longitude $84^{\circ}45'$ reached the latitude of $81^{\circ}44'$, or about thirty furlongs nearer the pole than Captain Markham had been on the Palæocrystic Sea in 1876, and in doing this he had added to our charts a new coast-line of a hundred miles beyond the farthest point seen by Lieutenant Beaumont during the Nares expedition. Although Lockwood saw as far as 38° west longitude, yet there were no signs that he was anywhere near the northern end of Greenland, which consequently remains as great a mystery as before.

The northern coast which he surveyed resembled the coast to the south in nearly all respects. There were deep fiords and outlying islands. The interior was a confused mass of mountains covered with snow or ice. The fiords were broad level stretches of snow and ice, devoid of ice-foot, floebergs, hummocks, or any other sign that could show their connection with the Spitzbergen Sea. The rocks were rugged and steep, and built up of quartz and schistose slate. The

vegetation was the same as that of Grinnell Land, and saxifrages and Arctic poppies were found growing along the route. Above the eighty-third parallel a hare and ptarmigan were killed, and traces were visible of the lemming, the Arctic fox, and the Polar bear, and, strangest of all, at the farthest point reached there was heard the cry of a snow bunting. From Cape Bryant along the entire coast a tidal frontier was found running from headland to headland; to the south of it the ice was smooth and flat, to the north of it were the same wild hummocks of palæocrystic ice on which Markham led his men out over the ocean in 1876. Where he stopped he took soundings at seventy-two fathoms, but Lockwood in trying between Cape May and Cape Britannia could not reach the bottom at one hundred and thirty-three fathoms. The farthest point reached now bears the name of Lockwood Island, the farthest point seen was named Cape Robert Lincoln.

In the south-westerly direction there was found for seventy miles an immense ice-cap estimated at six thousand miles in area; but between the eighty-first and eighty-second parallels the country south of the cap extending from Kennedy and Robeson channels to the western Polar ocean was free from snow for a hundred and fifty miles and more. Vegetation abounded, dead willow was gathered in such abundance as to serve for fuel, and in more than one locality willow, saxifrages, grasses, and other plants grew in such profusion as to completely cover large tracts, affording excellent pasturage for the musk cattle, which feed towards the coast during the summer and withdraw to the interior as winter advances. Evidences were noted in the way of raised beaches, marine shells, and drift wood of the recent elevation of the land above the sea, and at one place

the trunks of two large coniferous trees were found in such a state of preservation as to allow of their use for fuel. And on the shores of Lake Hazen to the west of Fort Conger there were met with the remains of permanent Eskimo huts. The farthest point reached in this direction was latitude $80^{\circ} 48'$, longitude $73^{\circ} 28'$. As with all American expeditions, some curiously inappropriate names were bestowed; such monstrosities, for instance, as the "R. L. Dodge River," and "Lake J. S. Fletcher, Jun.," being obviously doomed to the proverbial short life—and a merry one.

Greely's retreat promised at first to be successful. It was not till January, 1884, that his party began to die off, and famine did not threaten them till late on in the spring. But then the disease which had been laughed at had begun its work, and when the rescue took place at Camp Clay nearly all had perished. The relief expedition had been placed under the command of Captain Schley, who took with him two Dundee sealers, the Thetis and the Bear, and Sir George Nares's old ship the Alert, which had been presented for the purpose by the British Government. After cruising about a little and finding the records Greely had left, Schley fortunately discovered the islet on which the last camp had been pitched. He was only just in time; seven of the men were alive. Had he been two days later all would have been lost.

A miserable sight it was that greeted Lieu-

tenant Colwell as he walked up to the tent which had been wrecked by the gale, and could only be opened by cutting a slit in its cover.

"It is not easy to give an idea of the desolate and horrible aspect of this bleak and barren spot as it looked to those who reached it on that memorable Sunday in June, 1884. In front lay the sea with its ice pack stretching away to the northward, and at the back the glaciers and rocky precipices of the mountains. On one side was the slope, with its rude graves, and on the other the deserted and roofless hut with the ice-foot below it; while between them was the wrecked tent in which lay the remnant of the expedition, half dead with cold and hunger and distress. Everywhere was the barren rock, except where the snow still lay deep in the hollows. There was no soil except the sandy disintegration of the rocks themselves, and but little of that. On the southern slopes here and there were little patches of flowering moss, the only vegetation that could find support in this Arctic wilderness. At the foot of the ridge lay the body of Schneider, who had died four days before, and whom the others had been too weak to bury. Everywhere around the hut and around the tent were scattered broken cans, rude cooking utensils, and tattered clothing."

After the stones had been lifted that kept down the flapping tent, the lieutenant en-

tered. "On one side, close to the opening, with his head towards the outside, lay what was apparently a dead man. His jaw had dropped, his eyes were open, but fixed and glassy, his limbs were motionless. On the opposite side was a poor fellow, alive to be sure, but without hands or feet, and with a spoon tied to the stump of his right arm. Two others, seated on the ground in the middle, had just got down a rubber bottle that hung on the tent pole, and were pouring from it into a tin can. Directly opposite, on his hands and knees, was a dark man with a long matted beard, in a dirty and tattered dressing-gown, with a little red skull-cap on his head, and brilliant staring eyes. As Colwell appeared he raised himself a little, and put on a pair of eyeglasses. 'Who are you?' asked Colwell. The man made no answer, staring at him vacantly. 'Who are you?' again. One of the men spoke up. 'That is the major—Major Greely.' Colwell crawled in and took him by the hand, saying to him, 'Greely, is this you?' 'Yes,' said Greely, in a faint broken voice, hesitating and shuffling with his words, 'yes—seven of us left—here we are—dying—like men—did what I came to do—beat the best record.'

And so he had. The best—and the worst. For outside lay the mutilated corpse of Henry with a bullet through it; and near by were six of the other corpses—all of which had been cut and "the flesh removed."

BOY LIFE AFLOAT.

BY CAPTAIN H., LATE R.N.

I.—CROSSING THE LINE.

THE old-fashioned saturnalia of Neptune's visit aboard vessels crossing the line is now but seldom met with, except in rare instances on sailing ships, the captains of which enjoy keeping up the ancient customs of "the good old days."

On board fast steamers, that are always driven full speed ahead, and are bound to make a quick passage or "bust," as the Americans say, they have neither time nor inclination for such frivolities, and in a few years the custom, now more honoured in the breach than the observance, will be as much a thing of the past as the belief in the Flying Dutchman, or in the ill-luck of sailing on a Friday. It is an open question even amongst its admirers whether it was ever of any real good, but there is no doubt that it formed a break in the tedium and monotony of a long voyage, and afforded much amusement to all concerned, excepting the victims themselves.

The following is the account of the writer's initiation some twenty-five years ago, and will be found a very fair representation of what the ceremony used to be: in some ships, of course, it was milder, and in others it was carried to a greater extreme.

We were on board a small corvette, and the men, having obtained permission from the captain, began making their preparations a day or two beforehand. There was a great deal of mystery maintained about the business, and some of the "green hands" were kept so much in the dark that they were not even aware that anything out of the common was about to occur.

We did not cross the line until about four bells in the forenoon watch (ten o'clock a.m.); and at noon, when this information was announced, certain mysterious smiles, nods, and winks were exchanged among those who were in the secret.

After dinner there suddenly came a hail from somewhere over the bows—most likely some fellow had climbed out on the rigging of the bowsprit for the purpose.

"Ship ahoy!"

"Hallo!" replied the captain, who was evidently expecting the summons and had remained on deck on purpose.

"What ship is that?" inquired the mysterious voice.

"H.M.S. H—r."

"Be good enough to heave to; I want to come on board."

The orders were immediately given, and the maintop sail yard was backed, and the ship heve-to.

Then from the other side of the fore course, where they had been attiring themselves, Neptune and his court made their appearance and walked aft.

King Neptune was disguised in a flowing oakum wig, well powdered with flour, on which rested a handsome tin crown, while a canvas mantle covered his shoulders, and he held a three-pronged harpoon in his hand.

By his side walked a sea man dressed as a woman, and supposed to be Amphitrite, his queen; she wore any amount of petticoats, a marvellously constructed bonnet, and a paper parasol.

She took short mincing footsteps, and pretended to be very modest and shy.

Behind them came the doctor with an exaggerated lancet, pill-box, and medicine bottle, the barber with a huge razor made out of a piece of hooping from a barrel, the barber's mate with a lather-pot and shaving-brush, both of Brobdingnagian dimensions, and a host of lesser tormentors dressed up to represent everything that could not be found on the face of the earth.

"Good day to your honour," exclaimed Neptune, bowing and scraping to the captain. "I've come on board to welcome you to my d'minions—all right, Frigthy, yer needn't punch so, I'll interduce ye d'rectly—and this here's my missis, yer honour."

"Very pleased to see your majesties, I'm sure," answered the captain, with difficulty restraining a smile as Amphitrite gave a curtsy, "and what can I do for you?"

"Why, I heard as how your honour had got a lot of green uns aboard what had never

crossed the line afore, so I thought as how I'd like to make 'em free."

"Very good," said the captain, "and as you have evidently travelled some distance, perhaps you would not object to drinking the queen's health?"

Would a duck swim? The health was duly honoured, and then Neptune turned his attention to business.

While he had been addressing the captain his followers had been busy fixing up a little throne on the gangway, in front of which was a small seat for the prisoner, consisting of a plank, the ends of which rested on two barrels. Behind this had been arranged a large tarpauling, that had been shaped into a species of tank and filled with water, from two feet and a half to three feet deep in the centre.

Neptune and his queen having seated themselves upon the throne, the first victim was brought before them.

They began with the officers, and we all obtained our freedom at the price of a fee each. Next came the seamen, and then began the fun.

The routine was to seat the poor wretch on the plank, and then Neptune would remark,

"I say, Frigthy, his hair's too long, ain't it?"

"Rather," the queen would reply, "and look at his beard."

Then the barber would be summoned and told to do his duty.

He would commence lathering the victim with a composition of soap, bilge-water, and every other abomination they could get hold of.

In the midst of this, Neptune would ask the poor fellow's name, and when he opened his mouth to reply the barber would fill it with the lathering composition, and then the plank being tipped up, he would be sent backwards into the water, where a couple of water-imps would see that he was properly washed—i.e., half-drowned—before he made his exit the other side.

Suddenly amid the laughter there arose a

ery of triumph, and in a few minutes a body of imps were seen dragging towards the throne no less a person than the master-at-arms. This person is the chief of the ship's police, and holds almost the equivalent rank of a superintendent ashore.

As it happened, this particular master-at-arms had greatly abused his power and made himself very unpopular on board, so much so that on one occasion the captain had been obliged to privately reprimand him for exceeding his duty. Therefore it may be imagined with what delight the men seized the opportunity of paying off some of their old scores.

"I protest!" yelled the master-at-arms, struggling furiously. "Remember I am the master-at-arms. I will not be treated in this disgraceful manner! I will report you all! This is shameful! I will not submit to it."

But he was obliged to, and at length he was firmly seated upon the plank of punishment and the lathering commenced.

But even that did not cause him to hold his peace, and with his eyes, nose, ears, and mouth full of lather, he continued to abuse and threaten his tormentors.

"You've got too much lather on, barber," called out Neptune, holding his sides with laughter, and then the barber produced his razor and commenced scraping the unhappy man until his cheeks must have been as sore as if they had been blistered.

If the reader can imagine what he would feel like after having been well rubbed with a nutmeg-grater for a quarter of an hour he will be able to sympathise with the feelings of the master-at-arms.

At last when the unhappy victim had nearly worked himself up into a state of

semi-raving lunacy they capsized him into the tank behind.

The attendant imps were not backward in their part of the business, and the unfortunate master-at-arms swallowed nearly as much salt water during the next ten minutes as he had fresh water ever since we left England.

At length he was allowed to make his escape, and disappeared down the hatchway. He was not seen again for the next three days, for he put himself on the sick-list and remained in seclusion. He tried very hard to ascertain who his tormentors were, but the secret was well kept and the names never leaked out.

Of course there was no more work done on board the ship that day.

(To be continued.)

CHESS.

(Continued from page 510.)

CONSULTATION GAME.

Played in February, 1885, between S. and S. (White), and H. M. (Black).

Irregular Opening.

WHITE.	BLACK.
1. P-Q 4	P-K Kt 3
2. P-K 4	B-Kt 2
3. Kt-K B 3	P-Q 3
4. B-Q B 4	B-Kt 5
5. P-K R 3	BxKt
6. QxB	P-K 3
7. P-B 3	Kt-K 2
8. B-K Kt 5	Kt-Q 2
9. Kt-Q 2	P-Q B 3
10. P-Q R 3	Castles
11. B-R 2	P-Q 4
12. P-K 5	P-B 3
13. PxP	KtxP
14. Q-K 2	Q-Q 3
15. Castles, Q side	Q R-K sq.
16. P-B 3 (a)	Kt-B 4
17. Q-B 2	P-Kt 4
18. Kt-Kt 3 (b)	Kt-Kt 6 (c)
19. K R-K sq. (d)	

Which were the moves that enabled Black to win an officer in seven moves? This question is our

PROBLEM No. 105.

NOTES.

(a)—P-K Kt 4 would have been better.
(b)—White now tried to prevent Black's intention of playing P-Q R 4, but thus gave up the defence of the dangerous square at K 4.

(c)—White must now lose either the exchange or the Q B.

(d)—Safer to have taken the Kt with the B, for Black must now win the exchange or an officer in seven moves.

To Chess Correspondents.

"STALEMATE."—Your friend is right. The rule in your old book is no longer used. At present you do not lose, but draw, by placing your opponent into stalemate. If a King cannot move and is not in check, and if none of his men can move, then the game is a draw, and is counted half a point to each player.

CECIL B.—The following position would do. White: Ka 5; La 3; Nf 1; Ob 7, f 2; Pa 2, b 6, d 4, e 6. Black: Kd 5; Of 5; Pf 3, f 6, f 7.

H. A. U.—Solutions correct.

REDUCED RATES FOR POSTAL ORDERS.

Readers desirous of helping on our Gordon Memorial Fund would do well to note the reduced rates at which Postal Orders are now obtainable. They are now issued as follows: 1s., 1s. 6d.— $\frac{1}{2}$ d. 2s., 2s. 6d., 3s., 3s. 6d., 4s., 4s. 6d., 5s., 7s. 6d., 10s., 10s. 6d.—1d. 15s., 20s.— $\frac{1}{2}$ d.

THE "BOY'S OWN" GORDON MEMORIAL FUND.

(Continued from page 527.)

WE are happy to be able to report that the collecting cards are now being daily applied for, and a goodly number have already been furnished. At present we have not heard from many of the larger public and private schools; but every school, we should hope, would be in some way represented. The lads in our workshops and factories should also take up the matter with zealous interest.

The "Model Yachtsman" for May, after quoting from our columns the particulars as to the object and scope of the Fund, remarks:—

"This explanation of the object is sufficiently explicit to enable us to understand that Gordon's well-known love for the young and helpless is through the aid of 'our boys' to be a perpetual fountain, still swelling forth, though he be dead, in blessed streams of assistance and succour for the oppressed and miserable. The Institution for Destitute Boys, or whatever form is actually decided on, will no doubt be all that Gordon could wish, and is a worthy object for the tribute of the Boys of Britain to the memory of that great Christian spirit. We should therefore recommend our youthful readers to send to the BOY'S OWN PAPER for a Subscription Card, and identify themselves with the 'Boy's Own' Gordon Memorial."

(Contributions received up to April 30.)

Carried forward £12 13 11

ADHUC TIRO (Ayr).—The Marjorie is a 68-tonner, designed by G. L. Watson. In 1884 she won ten first and five second prizes out of thirty-five starts, and the value of the prizes was £922. We have taken the liberty of quoting from your welcome letter about the catamaran.

CONNAUGHT RANGER.—Promotions from the ranks are very rare, but there is no examination.

HOPE.—The engineer students for the Navy are specially trained, and you are too old to enter. Your best plan would be to apply to the superintending engineer of one of the large steamship lines.

J. C. P.—Apply to the Institute of Civil Engineers. You will have to be apprenticed. There is an engineering school at the Crystal Palace which has a good reputation.

A RUSSIAN (St. Petersburg).—All the volumes are kept in print. "The Giant Raft" was in the third volume; "The Cryptogram," its sequel, in the fourth. Captain Cook was killed in 1779.

PAUL MASCARENHAS.—Go on a walking tour and wear a knapsack. That is the best cure for round shoulders. In the phrase, "Davy Jones's Locker," Davy=duffy, the nigger term for a ghost; and Jones=Jonah. Davy Jones is thus Duffy Jonah, and the meaning is that the man has gone to the place of safe keeping where Jonah was sent to.

AJAX.—We gave some notes on dumb-bells in the articles on Gymnastics in the second volume.

DOUBLE DEVEY.—1. A man has a right to pronounce his name as he pleases, but the usual pronunciation of the word Marjoribanks is as you say, Marjbanks. 2. An ordinary Civil Service examination. For particulars apply to Cannon Row.

C. P. I.—1. The Greek system of numbers was a letter one, like the Roman, but quite different. The first nine letters of their alphabet represented the units—alpha for 1, beta for 2, etc.; the next nine the tens—iota for 10, kappa for 20; and the third nine for hundreds—sigma for 200, tau for 300, etc. A dash underneath stood for thousands, and an M multiplied the value ten thousand times. With regard to your opinion that the old systems answered every purpose that a reasonable person could require, perhaps you would like to extract the cube root of $\delta\psi\omicron\delta$ in the Greek numeration. 2. January from Janus, February from Februus, March from Mars, April from Aprilis, May from Maia, June from Juno, July from Julius Caesar, August from Augustus Caesar. September, October, November, December, seventh, eighth, ninth, and tenth months.

GULIELMUS.—The Probate Registry has been removed from Doctors' Commons to Somerset House, and hence letters on the subject of wills go to Somerset House, no matter how addressed. Doctors' Commons is on the south side of St. Paul's Churchyard. To "common" is to dine together, and the place is so called owing to the doctors of civil law having to dine together there on certain days in the week, when the ecclesiastical courts were in session.

H. H. C.—A yorker is a full pitch or a volley—a ball that does not touch the grass until it has passed the popping-creeper.

G. W. F. WRIGHT.—Gooseberry=gorseberry=rough berry. Strawberry=strewowberry—the plant that strays (by throwing out its runners); hence Latimer's Strawberry Preachers=non-resident clergy, who strayed from their parishes.

VIOLIN.—To prevent the pegs slipping or sticking try Paralapsine, obtainable in fourpenny bottles, post free, from F. P. Fullbrook, 157, High Street, Hounslow. It is said to be most efficient. A little powdered resin is the usual remedy.

CATAMARAN, BARNUM, and Others.—Your doubts and queries as to the catamaran described in the part for last May are nearly all answered in the following letter from ADHUC TIRO (Ayr), just to hand:—"Five fellows here made a catamaran some time ago, according to the directions given in the Boy's OWN PAPER, but as our finances were rather limited we could not construct it the full size. The pontoons were made of five-eighths lining, six and a half inches broad. The beams joining the pontoons were six feet long and two inches square, screwed down with strong hoop-iron. The sail we made of cotton-bags opened out and sewed together. The mast was stepped into a block of wood bolted to the deck and fore-beam. It was fitted with a sprit, and a stay on each side. We launched the craft on the Merchants' Holiday here. We went all right till we got in front of the mouth of the harbour, when we saw the tug bearing down on us, then we had to cut across the harbour to avoid it. The wind was beginning to blow pretty strongly from the south, and we were in a fair way to be blown off the coast. Our two paddles were of no use, so we had to run straight for the shore; however, we got in all right, and had a fine sail afterwards with a beam wind. I think the catamaran has not sufficient hold in the water to beat to windward; that is almost its only fault."

G. R. Y. (Birkenhead).—"Killiecrankie" and the "Island of the Scots" are by Professor Aytoun. You had better buy the "Lays of the Scottish Cavaliers;" there are many editions published by Blackwood. The ballad of "Obadiah-bind-their-Kings-in-chains-and-their-nobles-with-links-of-iron" is by Lord Macaulay, and you will find it with his Lays.

BOXER.—Join the Cadet Corps of the London Rifle Brigade. For particulars, apply to the staff-sergeant, F. C. Ellett, 30, Southampton Row, High Holborn, W.C., or to the headquarters of the regiment. You can see the corps drilled in Guildhall on Tuesday and Friday evenings.

UNCLE BILLY.—Leave the old violin alone. The wearing off of the varnish by constant use is one of its chief recommendations.

AN INQUIRER.—You can obtain any coloured plate by buying the part containing it. We have had to reprint.

F. C. POOLE.—Skates with double runners have been tried on ice before, and proved failures. If you cannot skate on ordinary skates, you must strengthen your ankles till you can.

BUTCHER.—Persons in search of situations on ships should apply to the owners of the ships. If there is not a vacancy on one vessel of the line there may be on another.

A. R. N.—The cotton grass is one of the *Cyperaceae*—*Eriophorum*.

J. W. ATKINSON.—There were articles on the Magic Lantern in the February and March parts for 1884.

W. F. U.—The articles on Violin Making were in the November and December parts for 1882.

J. M. (Leith).—1. There is a shilling book on Canaries, published by Dean and Son. There are, besides, a two-shilling book, published by L. U. Gill, 170, Strand, on "General Management of Canaries;" another by him on "Exhibition Canaries;" and a five-shilling "Canary Book," containing the other two. 2. The varnish will do no harm.

A READER OF THE "B. O. P."—1. You can get "La Nature" from any bookseller. It is a French scientific paper, published weekly, and answers to our own "Nature." 2. "Adventures in the Air" were in the October part for 1883.

CHRIS.—You would find Spohr's Violin School as good a practice-book as any. But any music-seller would advise you.

T. J. K.—Give the scraps a coat of size first, and then varnish them with any clear varnish.

W. H. SAUSSEN, JUN.—1. Dumb-bells should never exceed two pounds in weight. If you want something heavier get Indian clubs. 2. Apply to Routledge or Warne. 3, etc. Too many questions.

D. A. G.—1. You could get them by enclosing the cost and a directed envelope. 2. The British coins circulate in all the colonies. There is a mint at Sydney.

LONDONDERRY.—The scientific name of the reindeer moss is *Cladonia rangiferina*.

R. S. V. P.—There is a life of Havelock by Marshman, and one of Wolfe by Parkman.

NEMO.—Your father's brother is your uncle, and it matters not when he was born.

A YOUNG BLACKSMITH.—The articles on Cardboard Modelling were in the fifth volume.

PRINCE ARTHUR.—There is no difficulty; the clause is self-explanatory. A gentleman is not a waterman or lighterman, nor does he ply, work, or navigate a wherry. Your reading would prevent your hiring a boat at a shilling an hour. You are neither a free man of the Company nor an apprentice. Better leave Acts of Parliament alone.

ONE ABOUT TO MAKE A FORTUNE (and we hope he may, and use it properly, though riches are not everything).—The Boy's OWN PAPER has an office in the Canadian capital.

SWEET WILLIAM.—Mr. Ballantyne's "Twice Bought" was in the fifth volume.

W. R. K.—1. The examination is supposed to be more difficult, hence the superior value of the degree. 2. There are so many exceptions that you had better get a calendar.

AN IRISHMAN.—The articles on Training were in the second volume. There were six of them, and they were in the July, August, and September parts.

YOUNG BUCK.—Catlin was an American. His works were his Letters, in two volumes, published in 1841; his "North American Portfolio of Hunting Scenes," published in 1844; his "Eight Years' Travel and Residence in Europe," published in 1849; and his "Life among the Indians," and "Okeepah," published in 1867. All his books were illustrated. Schoolcraft was also an American, born 1793, died 1864, but more of a man of science. His Indian books were "Scenes in the Ozark Mountains," 1853; "Travels in the Mississippi Valley," 1825; "Expedition to Itasca," 1834; "The Iroquois," 1847; "The History of the Indian Tribes," 1847; "Talladega," "Oncota," "Thirty Years with the Indians," and "Indian Fairy Book," of which there are numerous editions.

F. SUTHER.—Not Creole, but Crele—Joseph Crele—"the oldest man in America," said to have been born at Detroit in 1725, died at Caledonia, Wisconsin, January 27, 1866. The date of his birth is arrived at from the record of his baptism in the French Catholic Church at Detroit. He married in 1755, and settled at Prairie du Chien. He was out with Braddock, and present at his defeat. A few years before his death he gave evidence as an eye-witness of events that took place eighty years before.

AJAX THE SECOND.—Better buy a small lathe to begin with. You could get a fairly good one for a couple of guineas. Apply for list to the Britannia Company, Colchester.

No. 333.—Vol. VII.

SATURDAY, MAY 30, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN:

A TALE OF CITY LIFE.

BY TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER IX.—SAMUEL SHUCKLEFORD COMES OF AGE.

REGINALD, meanwhile, blissfully unconscious of the arrangements which were being made for him, spent as comfortable an evening as he could in the conviction that to-morrow would witness his dismissal from the "Rocket," and see

"Gave the Performer a dig in the back."

him a waif on the great ocean of London life. To his mother, and even to young Gedge, he said nothing of his misgivings, but to Horace, as the two lay awake that night, he made a clean breast of all.

"You'll call me a fool, I suppose," he said; "but how could I help it?"

"A fool! Why, Reg, I know I should have done the same. But for all that, it is unlucky."

"It is. Even eighteen shillings a week is better than nothing," said Reginald, with a groan. "Poor mother was saying only yesterday we were just paying for our keep, and nothing more. What will she do now?"

"Oh, you'll get into something, I'm certain," said Horace; "and meanwhile—"

"Meanwhile I'll do anything rather than live on you and mother, Horrors! I've made up my mind to that. Why," continued he, "you wouldn't believe what a sneak I've been already. You know what Bland said about the football club in his letter? No, I didn't show it to you. He said it would go down awfully well if I sent the fellows my usual subscription. I couldn't bear not to do it after that, and I—I sold my tennis-bat for five shillings, and took another five shillings out of my last two weeks' wages, and sent them half a sov. the other day."

Horace gave an involuntary whistle of dismay, but added, quickly,

"I hope the fellows will be grateful for it, old man; they ought to be. Never mind, I'm certain we shall pull through it some day. We must hope for the best, anyhow."

And with a brotherly grip of the hand they turned over and went to sleep.

Reginald presented himself at the "Rocket" next morning in an unusual state of trepidation. He had half made up his mind to march straight to the manager's room and tell him boldly what had happened, and take his discharge from him. But Horace dissuaded him.

"After all," he said, "Durfy may think better of it."

"Upon my word I hardly know whether I want him to," said Reginald, "except for young Gedge's sake and mother's. Anyhow, I'll wait and see, if you like."

Mr. Durfy was there when he arrived, bearing no traces of last night's *fracas*, except a scowl and a sneer, which deepened as he caught sight of his adversary. Reginald passed close to his table in order to give him an opportunity of coming to the point at once; but to his surprise the overseer took no apparent notice of him, and allowed him to go to his place and begin work as usual.

"I'd sooner see him tearing his hair than grinning like that," said young Gedge, in a whisper. "You may be sure there's something in the wind."

Whatever it was, Mr. Durfy kept his own council, and though Reginald looked up now and then and caught him scowling viciously in his direction, he made no attempt at hostilities, and rather appeared to ignore him altogether.

Even when he was giving out the "copy" he sent Reginald his by a boy instead of, as was usually his practice, calling him up to the table to receive it. Reginald's copy on this occasion consisted of a number of advertisements, a class of work not nearly as easy and far less interesting than the paragraphs of news which generally fell to his share.

However, he attacked them boldly, and, unattractive as they were, contrived to get some occupation from them for his mind as well as his hand.

Here, for instance, was some one who wanted "a groom, young, good-looking, and used to horses." How would that suit him? And why need he be good-looking? And what was the use of saying he must be used to horses? Who ever heard of a groom that wasn't? The man who put in that advertisement was a muff. Here was another of a different sort:

"J. S. Come back to your afflicted mother and all shall be forgiven."

Heigho! suppose "J. S." had got a mother like Mrs. Cruden, what a brute he must be to cut away. What had he been doing to her? robbing her? or bullying her? or what? Reginald worked himself into a state of wrath over the prodigal, and very nearly persuaded himself to leave out the promise of forgiveness altogether.

"If the young gentleman who dropped an envelope in the Putney omnibus on the evening of the 6th instant will apply to B., at 16, Grip Street, he may hear of something to his advantage."

How some people were born to luck! Think of making your fortune by dropping an envelope in a Putney omnibus. How gladly he would pave the floor of every omnibus he rode in with envelopes if only he could thereby hear anything to his advantage. He had a great mind to stroll round by No. 16, Grip Street that evening to see who this mysterious "B" could be.

"To intelligent young men in business.—Add £50 a year to your income without any risk or hindrance whatever to ordinary work.—Apply confidentially to Omega, 13, Shy Street, Liverpool, with stamp for reply. None but respectable intelligent young men need apply."

Hullo! Reginald laid down his composing-stick and read the advertisement over again: and after that he read it again, word by word, most carefully. £50 a year! Why, that was as much again as his present income, and without risk or interfering with his present work too! Well, his present work might be his past work to-morrow; but even so, with £50 a year he would be no worse off, and of course he could get something else to do as well by way of ordinary work. If only he could bring in £100 a year to the meagre family store! What little luxuries might it not procure for his mother! What a difference it might make in that dreary, poky Dull Street parlour, where she sat all day. Or if they decided not to spend it, but save it up, think of a pound a week ready against a rainy day! Reginald used to have loose enough ideas of the value of money; but the last few weeks had taught him lessons, and one of them was that a pound a week could work wonders.

"Apply confidentially." Yes, of course, or else any duffer might snatch at the prize. It was considerate, too, to put it that way, for of course it would be awkward for any one in a situation to apply unless he could do it confidentially—and quite right too to enclose a stamp for a reply. No one who wasn't in earnest would do so, and thus it would keep out fellows who applied out of mere idle curiosity. "None but respectable intelligent young men need apply." Humph!

Reginald's conscience told him he was respectable, and he hoped he was also moderately intelligent, though opinions might differ on that point. "Omega"—that sounded well! The man knew Greek—possibly he was a classical scholar, and therefore sure to be a gentleman. Oh, what a contrast to the cad Durfy! "Liverpool." Ah, there was the one drawback; and yet of course it did not follow the £50 a year was to be earned in Liverpool, otherwise how could it fail to interfere with ordinary business? Besides, why should he advertise in the "Rocket" unless he meant to get applications from Londoners?

Altogether Reginald was pleased with the advertisement. He liked the way it was put, and the conditions it imposed; and, indeed, was so much taken up with the study of it that he almost forgot to set it up in type.

"Whatever are you dreaming about?" said young Gedge; "you've stood like that for a quarter of an hour at least. You'll have Durfy after you if you don't mind."

The name startled Reginald into industry, and he set the advertisement up very clearly and carefully, and re-read it once or twice in the type before he could make up his mind to go on to the next.

The thought of it haunted him all day. Should he tell Horace, or Gedge, or his mother of it? Should he go and give Durfy notice then and there? No, he would reply to it before he told any one; and then, if the answer was unsatisfactory—which he could not think possible—then no one would be the wiser or the worse for it.

The day flew on leaden wings. Gedge put his friend's silence down to anxiety as to the consequences of yesterday's adventure, and did and said what he could to express his sympathy. Mr. Durfy alone, sitting at his table, and directing sharp glances every now and then in his direction, could guess the real meaning of his pre-occupation, and chuckled to himself as he saw it.

Reginald spent threepence on his way home that evening—one in procuring a copy of the "Rocket," and two on a couple of postage-stamps. Armed with these, he walked rapidly home with Horace, giving him in an absent sort of way a chronicle of the day's doings, but breathing not a word to him or his mother subsequently about the advertisement.

After supper he excused himself from joining in the usual walk by saying he had a letter to write, and for the first time in his life felt relieved to see his mother and brother go and leave him behind them.

Then he pulled out the newspaper and eagerly read the advertisement once more in print. There it was, not a bit changed! Lots of fellows had seen it by this time, and some of them very likely were at this moment answering it. They shouldn't get the start of him, though!

He sat down and wrote—

"Sir,—Having seen your advertisement in the 'Rocket,' I beg to apply for particulars. I am respectable and fairly intelligent, and am at present employed as compositor in the 'Rocket' newspaper office. I shall be glad to increase my income. I am 18 years of age, and beg to enclose stamp for a reply to this address. Yours truly,—REGINALD CRUDEN."

He was not altogether pleased with

this letter, but it would have to do. If he had had any idea what the advertiser wanted intelligent young men for he might have been able to state his qualifications better. But what was the use of saying "I think I shall suit you" when possibly he might not suit after all?

He addressed the letter carefully, and wrote "private and confidential" on the envelope; and then walked out to post it, just in time, after doing so, to meet his mother and Horace returning from their excursion.

"Well, Reg, have you written your letter?" said his mother, cheerily. "Was it to some old schoolfellow?"

"No, mother," said Reginald, in a tone which meant "I would rather you did not ask me." And Mrs. Cruden did not ask.

"I think," said she, as they stopped at their door—"I almost think, boys, we ought to return the Shucklefords' call. It's only nine o'clock. We might go in for a few minutes. I know you don't care about it; but we must not be rude, you know. What do you think, Reg?"

Reg sighed and groaned and said, "If we must we must;" and so, instead of going in at their own door, they knocked at the next.

The tinkle of a piano upstairs, and the sound of Sam's voice, audible even in the street, announced only too unmistakably that the family was at home, and a collection of pot hats and shawls in the hall betrayed the appalling fact, when it was too late to retreat, that the Shucklefords had visitors! Mrs. Shuckleford came out and received them with open arms.

"Ow 'appy I am to see you and the boys," said she. "I suppose you saw the extra lights and came in. Very neighbourly it was. We thought about sending you an invite, but didn't like while you was in black for your 'usband. But it's all the same now you're here. Very 'appy to see you. Jemima, my dear, come and tell Mrs. Cruden and the boys you're 'appy to see them; Sam too—it's Sam's majority, Mrs. Cruden; twenty-one he is to-day, and his pa all over—oh, 'ow 'appy I am you've come."

"We had no idea you had friends," said Mrs. Cruden, nervously. "We'll call again, please."

"No you don't, Mrs. Cruden," said the effusive Mrs. Shuckleford; "ere you are, and ere you stays—I am so 'appy to see you. You and I can 'ave a cosy chat in the corner while the young folk enjoy theirselves. Jemima, put a chair for Mrs. C. alongside o' mine; and, Sam, take the boys and see they have some one to talk to 'em."

The dutiful Sam, who appeared entirely to share his mother's jubilation at the arrival of these new visitors, obeyed the order with alacrity.

"Come on, young fellows," said he; "just in time for shouting proverbs. You go and sit down by Miss Tomkins, Horace, her in the green frock; and you had better go next Jemima, Cruden. When I say 'three and away' you've got to shout. Anything'll do, so long as you make a noise."

"No, they must shout their right word," said Miss Tomkins, a vivacious-looking young person of thirty. "Come close," said she to Horace, "and I'll whisper what you've got to shout." Whisper, "Dog, that's your word."

Horace seated himself dreamily where he was told, and received the confidential communication of his partner with pathetic resignation. He only wished the signal to shout might soon arrive. As for Reginald, when he felt himself once more in the clutches of the captivating Jemima, and heard her whisper in his ear the mysterious monosyllable "love," his heart became as ice within him, and he sat like a statue in his chair, looking straight before him. Oh, how he hoped "Omega" would give him some occupation for his evenings that would save him from this sort of thing!

"Now call them in," said Sam.

A signal was accordingly given at the door, and in marched a young lady, really a pleasant, sensible-looking young person, accompanied by a magnificently-attired young gentleman, who, to Horace's amazement, proved to be no other than the melancholy Booms.

There was, however, no time just now for an exchange of greetings.

Mr. Booms and his partner were placed standing in the middle of the floor, and the rest of the company were seated in a crescent round them. There was a pause, and you might have heard a pin drop as Samuel slowly lifted his hand and said in a stage whisper,

"Now then, mind what you're at. When I say 'away.' One, two, three, and a—"

At the last syllable there arose a sudden and terrific shout which sent Mrs. Cruden nearly into a fit, and made the loosely-hung windows rattle as if an infernal machine had just exploded on the premises.

The shout was immediately followed by a loud chorus of laughter, and cries of,

"Well, have you guessed it?"

"Yes, I know what it is," said the pleasant young lady. "Do you know, Mr. Booms?"

"No," he said, sadly; "how could I guess? What is it, Miss Crisp?"

"Why, 'Love me love my dog,' isn't it?"

"Right. Well guessed!" cried everyone; and amid the general felicitation that ensued the successful proverb-guessers were made room for in the magic circle, and Horace had a chance of exchanging "How d'ye do?" with Mr. Booms.

"Who'd have thought of meeting you here?" said he, in a whisper.

"I didn't expect to meet you," said the melancholy one. "I say, Cruden, please don't mention—*her*."

"Her? Whom?" said Horace, bewildered.

Booms's reply was a mournful inclination of the head in the direction of Miss Crisp.

"Oh, I see. All right, old man. You're a lucky fellow, I think. She looks a jolly sort of girl."

"Lucky! Jolly! Oh, Cruden," ejaculated his depressed friend.

"Why, what's wrong?" said Horace. "Don't you think she's nice?"

"She is; but Shuckleford, Cruden, is not."

"Hullo, you two," said the voice of the gentleman in question at this moment; "you seem jolly thick. Oh, of course, shopmates; I forgot; both in the news line. Eh? Now, who's for musical chairs? Don't all speak at once."

"I shall have to play the piano now,

Mr. Reginald," said Miss Jemima, making a last effort to get a word out of her silent companion. "I'm afraid you're not enjoying yourself a bit."

Reginald rose instinctively as she did, and offered her his arm. He was half dreaming as he did so, and fancying himself back at Garden Vale. It was to his credit that when he discovered what he was doing he did not withdraw his arm, but conducted his partner gallantly to the piano, and said,

"I'm afraid I'm a bad hand at games."

"Musical chairs is great fun," said Miss Jemima. "I wish I could play it and the piano both. You have to run round and round, and then, when the music stops, you flop down on the nearest chair, and there's always one left out, and the last one wins the game. Do try it."

Reginald gave a scared glance at the chairs being arranged back to back in a long line down the room, and said,

"May I play the piano instead? and then you can join in the game?"

"What! do *you* play the piano?" exclaimed the young lady, forgetting her dignity and clapping her hands. "Oh, my eye, what a novelty. Ma, Mr. Reginald's going to play for musical chairs! Sam, do you hear? Mr. Cruden plays the piano! Isn't it fun?"

Reginald flung himself with a sigh down on the cracked music-stool. Music was his one passion, and the last few months had been bitter to him for want of it. He would go out of his way often even to hear a street piano, and the brightest moments of his Sundays were often those spent within sound of the roll of the organ.

It was like a snatch of the old life to find his fingers once more laid caressingly on the notes of a piano; and as he touched them and began to play, the Shucklefords, the "Rocket," Omega, all faded from his thoughts, and he was lost in his music.

What a piano it was! Tinny and cracked and out of tune. The music was in the boy's soul, and it mattered comparatively little. He began with "Weber's last waltz," and dreamed off from it into a gavotte of Corelli's, and from that into something else, calling up favourite after favourite to suit the passing moods of his spirit, and feeling happier than he had felt for months.

But "Weber's last waltz" and Corelli's gavottes are not the music one would naturally select for musical chairs; and when the strains continue uninterrupted for five or ten minutes, during the whole of which time the company is perambulating round and round an array of empty chairs, the effect is somewhat monotonous. Mrs. Shuckleford's guests trotted round good-humouredly for some time, then they got a little tired, then a little impatient, and finally Samuel, as he passed close behind the music-stool, gave the performer a dig in the back, which had the desired effect of stopping the music suddenly. Whereupon everybody flopped down on the seat nearest within reach. Some found vacancies at once, others had to scamper frantically round in search of them, and finally, as the chairs were one fewer in number than the company, one luckless player was left out to enjoy the fun of those who remained in.

"All right," said Samuel, when the first round was decided, and a chair withdrawn in anticipation of the next;

"I only nudged you to stop a bit sooner, Cruden. The game will last till midnight if you give us such long doses."

Doses! Reginald turned once more to the piano and tried once more to lose himself in its comforting music. He played a short German air of only four lines, which ended in a plaintive, wailing cadence. Again the moment the music ceased he heard the scuffling and scampering and laughter behind him, and shouts of,

"Polly's out! Polly's out!"

"I say," said Shuckleford, as they stood ready for the next round, "give us a jingle, Cruden; 'Pop goes the Weasel,' or something of that sort. That last was like the tune the cow died of. And stop short in the middle of a line, anyhow."

Reginald rose from the piano with flushed cheeks, and said,

"I'm afraid I'm not used to this sort of music. Perhaps Miss Shuckleford—"

"Yes, Jim, you play. You know the way. You change places with Jim, Cruden, and come and run round."

But Reginald declined the invitation with thanks, and took up a comic paper,

in which he attempted to bury himself, while Miss Shuckleford hammered out the latest polka on the piano, stopping abruptly and frequently enough to finish half a dozen rounds in the time it had taken him to dispose of two.

Fresh games followed, and to all except the Crudens the evening passed merrily and happily. Even Horace felt the infection of the prevalent good-humour and threw off the reserve he had at first been tempted to wear in an effort to make himself generally agreeable. Mrs. Cruden, cooped up in a corner with her loquacious hostess, did her best too not to be a damper on the general festivity. But Reginald made no effort to be other than he felt himself. He could not have done it if he had tried. But as scarcely any one seemed afflicted on his account, even his unsociability failed to make Samuel Shuckleford's majority party anything but a brilliant success.

In due time supper appeared to crown the evening's delights. And after supper a gentleman got up and proposed a toast, which of course was the health of the hero of the occasion.

Samuel replied in a facetious County Court address, in which he expressed himself "jolly pleased to see so many friends around him, and hoping they'd all enjoyed their evening, and that if there were any of them still to come of age—(laughter)—they'd have as high an old time of it as he had had to-night. He was sure ma and Jim said ditto to all he said. And before he sat down he was very glad to see their new next-door neighbours. (Hear, hear.) They'd had their troubles, but they could reckon on friends in that room. The young fellows were bound to get on if they stuck to their shop, and he'd like to drink the health of them and their ma." (Cheers.)

The health was drunk. Mrs. Cruden looked at Reginald, Horace looked at Reginald, but Reginald looked straight before him and bit his lips and breathed hard. Whereupon Horace rose and said,

"We think it very kind of you to drink our healths; and I am sure we are much obliged to you all for doing so."

Which said, the Shucklefords' party broke up, and the Crudens went home.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy Earl," etc.

CHAPTER XX.—FRAU VON STEINFELDT.

THE winter has crept on. The snows are lying so thick that where the footpath has been cut through the white mass on the boulevards a wall of nearly seven feet high is presented on either hand of the pedestrian.

The courtyards of the various houses (which, indeed, are important elements in the economy of the Russian houses) are well cleared of snow by the very industrious dvorniks, whose duties seem so manifold that we English, with all our "go," would be puzzled to get through half of them. One of these duties is to clear the courts of the snow, which is no easy task.

The first thing to be done when the heavy falls set in is to clear a pathway through the court for the various inhabitants of the house to approach the back entrances by which servants and tradespeople find access, and therefore the snow is shovelled off and flung in two heaps on either side. Periodically carts come and clear off this encumbrance of the court, and this is most vigorously done just after the thaw begins at the end of April. But besides this, after each heavy fall, there is almost of necessity a clearance of roads and pathways in the towns. Still, when the grand clearing begins in April thaw, there is hard work for shovel and pickaxe, for the successive layers of snow press heavily and still more heavily on the lowest stratum until this becomes a sheet of ice as hard and firm as marble.

At this time the frozen rivers break up, and huge blocks of ice are borne from the smaller streams to the grand waters of the big rivers that intersect Russia. Enough snow lies in the roads to afford

a good travelling basis to the sledges, which for so many months of the year are the chief means of transit. From the beginning of November until the thaw in April, generally speaking, no wheels are seen in the great towns, everything being moved on sledges, the only vehicles, save the few tram-cars, the railway-trains, and the Imperial state carriages for town use, which are on wheels.

The trial of Abrazoff for the suppression of Ivan's identity, wrongful detention of property, and other malpractices, has been concluded in Ivan's favour, for whose property Smirnoff has been named curator and administrator. But Ivan had implored him to provide for the wife and children of the malefactor, which he, greatly to his own disgust, has consented to do; for Ivan declared, on the day of the decision of the court, that unless something were done for them he would, on coming of age, make the whole over to Pavel.

To avert this—which, with Ivan's obstinate character, was far from unlikely—Smirnoff had visited Madame Abrazoff and had requested her to retain the town lodging which she now occupied, and to continue the education of her children on the same scale as before. But Madame Abrazoff declined to accept any alms from the "enemy of her house," as she called Ivan.

The cause had occupied a comparatively short time, for all the evidence had been conclusive. Brandt gained much reputation by his conduct of the whole affair, the real fact being that it was so clear a case that every attempt at defence broke down, and Ivan was triumphant.

Ivan's great object, now that winter had really set in, and the roads were covered with their mantle of smooth snow, through which—along certain beaten tracks, at least—the sledge would glide swiftly, and, but for the merry bells, noiselessly, was to visit Siberia, and, if possible, rescue his friend Anisie from the terrors of exile. His great trouble was Smirnoff's violent opposition to his going. He would not hear of it under any pretence whatever; nor was it until Madame Kakaroff said that she thought Ivan would "be missing" a third time unless permission were obtained, that he could be brought to listen to the idea for a moment.

At last, one day, after a long talk with that lady, he sent for Ivan and said to him,

"I hear some bad things of you, Ivan. You are, I understand, resolved to give me more pain than you have yet caused, and no person in this world has ever given me so much. You are bent on carrying out this mad scheme of going to Siberia, and even without my consent if you cannot go with it. How a boy like you can dare to set himself up against those who are older than himself—those to whom he owes everything—and bid defiance to their wishes, is more than I can understand. You have been rescued from worse than poverty, and raised to more than ordinary wealth. You are a mere child, and yet you have been treated like an equal by the most distinguished people of Russia. I have ever been a kind friend and father to you, and in return you do everything in your power to show your ingratitude. I have now

had enough; and I intend, as the most reasonable thing to be done with you, to place you as a boarder with Director Schwann, and to give him special charge over you. You will be allowed absolutely no liberty except during the summer vacation, which you are to spend with Tenterton in England. There you will be under his entire control."

felt rather unwell; I did not run away. It was fortunate in the end, because the police-officer found that I was the son of Captain Abrazoff, which was a great help, you know. And then Annie. Next to you, I owe everything to her. She preserved me from the cannibal, and though she *did* make me wear girl's clothes, I can forgive everything for her

uncle; you ought to invite them and ask them what they think. I shall want her to go with me, at any rate, so if she is against it I won't go. Ask her to talk it over with you, at least."

"It's of no use, Ivan. I cannot consent, as curator or guardian of a child, to expose him to such hardships and dangers. It cannot be!"

"Boxes were packed and fresh furs bought for the journey."

Ivan fell on his knees and clasped his hands in an agony of supplication. "Do not be so harsh with me," he pleaded. "I have, indeed I have, tried to do my best with Mr. Tenterton. I have made progress in German, in French, and Latin, to everybody's satisfaction, only to please you. I did not run away from you of my own free idea; it was Serge Nicolaevitch who took me, and you know how I suffered in consequence. The second time I did not mean to run away. I slipped out in the evening because I

kind treatment afterwards. Pray let me go and save her from the mines. I can do it, I know, and then I will never ask you for any further indulgence. You know Karamsoff goes every year to Siberia. He goes ever so far by rail and the rest by sledge. I should not get into any mischief. People might think I was going for you, and I really understand travelling. Madame Kakaroff thinks I ought to go, so does Ivan Petrovitch, only he dare not say so. I want you to write to Annie's aunt, and to her

"But you need not give me permission. You allow me to pay a visit to the Steinfeldts, who were so good to me when I was sent away from the cannibal with Annie. She will take me with her, and you only give permission as far as Kursk, and if she takes me on with her, why, that is not your fault, is it?"

"I must repeat what I have said, Ivan. It is utterly out of the question."

Finding all persuasion useless, Ivan next thought he would try some other influence. He begged for a fortnight's

interval before being sent to Schwann as a pupil, professing the profoundest disgust at the idea. Fortunately for Ivan, the "manners and customs" of that gentleman were getting more and more talked about by the general public, and Smirnoff was not so anxious about the matter as he appeared to be, although he felt that under Schwann the boy would find escape impossible. He disliked Schwann as a man, although he fully believed in him as a disciplinarian. He had a desire to act as much as possible in conformity with Ivan's wishes. He was, like most Russians, anxious to please, and he really wished to make the path of learning a pleasant road for Ivan. An English guardian would have packed his ward off to school without any hesitation, and without in the least consulting his inclinations. But Smirnoff was more kind-hearted in his views, and thought that as Ivan would have to endure the treatment, the more endurable it was made for him the better. He readily promised the extension of time, and Ivan was so far victorious.

As soon as the time arrived for his walk with Tenterton he begged his friend (for such he recognised him to be) to take him to see Anna Feodorovna Kakaroff, and as her house was situated on the boulevard, and it was not too cold to walk, they bent their steps thither. They found the lady at home, to whom Ivan now communicated his plan, having seen Tenterton walked off by "His High Excellency."

"You see," said our hero, "I must go. No other boy can play the two parts. I have the passports all right enough now, and Egor Sergevitch has promised me letters to police 'swells' out there, and you can make Ivan Petrovitch do what you like. Only in the first place I want you to invite Annie's aunt. That would be delightful, because then she could walk off with me at once. Mr. Smirnoff could no more resist her than Pavel Abrasoff can resist sugar-plums at Einem's.*"

"Well, I will at least write to this lady and tell her that there are certain persons in Moscow who take so great an interest in her niece that she ought to join the little party and add her aid to our united efforts in the cause. I think she may come."

"Think! I am sure of it," said Ivan; "and when she comes I will undertake to make her do what is right. Tell her that I am in it. But there is another thing that we must do—we must find out the part of Siberia where Annie is and the number which she has received instead of the name, which does not accompany prisoners over the border."

Within a week matters were carried out pretty much as Ivan had suggested. The plan worked well. The Steinfeldts had arrived by special invitation; Mr. Smirnoff was won over; for Madame Steinfeldt said she would go too. She thus explained the matter to Ivan's guardian:

"Do you think that I could countenance his being sent, child that he is, into the interior of Siberia, to run all possible risks there and on the journey? Why, he would never come back alive! But I undertake the expedition, and Ivan only goes out as my

companion and aid, for without him I am powerless. I trust you will allow him to go. I am the mother of a family of children, and yet my husband gives me leave to attempt the rescue of my sister's child; and, after all, Ivan has no such sacred ties as that to bind him to his home. His actual relatives have shown themselves all along his worst enemies. His two friends are yourself and Annie. It is hard if the one refuses to allow him to help in rescuing the other. Every moment is precious, and we have already lost time enough. I shall ask the general for letters of introduction to the governor of the district. I shall travel well attended, and in the best manner, on my own account as well as Ivan's, and I am sure to have aid in regard of the passports for myself and children."

Even Smirnoff was pleased with having seen reason to yield, knowing how much Ivan's heart was set upon getting off to Siberia. He dreaded driving him to open rebellion, or to the step of "running away," although he judged that the boy's feeling of honour and sudden determination to stick to the truth at all hazards would prevent his taking such a step after promising not to do so unless very high pressure were used. So Ivan was kept in ignorance of the arrival of Herr and Madame von Steinfeldt until the evening when he was to meet them at Smirnoff's.

"You know, Ivan," said Smirnoff, as they were sitting together on a sort of committee of ways and means—"you know that you could not have gone alone, nor would it have been of the slightest use, for prisoners, I find, in Siberia are not permitted to see mere friends and acquaintances. They are only allowed to receive actual relations, so that unless Frau von Steinfeldt had gone with you there would have been no chance whatever of your seeing Annie at all. You would have been taken up on suspicion, and have ended your days in prison. I say nothing of the cruel disappointment to me which your loss would have occasioned, the care wasted, and the hopes of your future all brought to nought. Your going with Madame Steinfeldt will remove the difficulty, inasmuch as she will be permitted to see Annie, and will probably have to present you to the authorities as one of her sons, in which case fresh passports must be provided, and this must be done at the office of the governor-general, whose secretary, Mr. Levinski, will do everything necessary at my representation."

Von Steinfeldt did not very cordially approve of the Siberian expedition, but his wife never had any other sister than Annie's mother, of whom she was passionately fond, and he was reluctant to place any difficulties in the way of her seeing—and, if possible, saving—this beloved sister's child. Von Hohenhorst had been a fashionable dandy guardsman in the days of his youth, and his wife's family had strongly objected to the marriage at first, but on the death of his father he had inherited a large fortune, left the service, and settled down, as he said, as a quiet country gentleman, looking after his land. He renewed his offer, and was accepted, but soon after his marriage he gave way to gambling. The young bride was not long in the enjoyment of her happiness. The lands were sold, and von Hohenhorst was a pauper. A house in St. Petersburg wanted at this

time a confidential German clerk, and von Steinfeldt had recommended his wife's brother. Von Hohenhorst accepted, and went to St. Petersburg, where, however, it was found, after two years, that he had falsified the books and had embezzled large sums of money. To screen his wife's family von Steinfeldt had induced the principals to forbear prosecuting on condition of their receiving from him the missing sums of money, which were paid. Annie was about ten years of age when this took place, and she was left an orphan by the death of her mother. Frau von Steinfeldt wished to take the little girl into her family and adopt her as one of her own, but the girl was passionately attached to her father, and could never see anything but good in the wretched outcast, who, however, had the one virtue of being as passionately devoted to her. Hohenhorst had now become connected with revolutionists and anarchists—people who are to society what wolves and other beasts of prey are among the flocks and herds. When Hohenhorst joined this fraternity von Steinfeldt had heard of it in some way, and had begged him to change his name on account of his wife's family, which he actually had the consideration to do, assuming that of Hermann. How he lived it was impossible to say, but he joined the gang of evil-doers infesting Moscow, and besides the graver crime of attempting the destruction of the national government, he was concerned in various great robberies, which had thrown the police into perfect consternation.

"As," said Steinfeldt, "the expedition is for the good of my wife's family, I cannot think of accepting any pecuniary help from Mr. Smirnoff, or, indeed, from any other friend of Ivan's. The whole undertaking becomes mine in right of my wife, whose expenses I alone can pay. The generous aid offered by Ivan we accept most cheerfully, but we cannot accept money."

"But," said Smirnoff, "I cannot let him travel at your expense, and so I propose that we divide the expense between us. In fact, that will be the only condition of my full permission."

After some talk this arrangement was definitely agreed upon as final. Both Ivan and Madame von Steinfeldt agreed that the winter journey would be best, and preparations were to be commenced at once. With this resolution the party broke up.

Kakaroff promised letters and support, while much was expected from the introductions to be furnished by Captain Malutin, who had been astonished at finding himself promoted to the rank of lieutenant-colonel, with full pay and appointments. Things are so wonderful in Russia! Boxes were packed and fresh furs bought for the journey, although it was fortunately not a very cold winter.

It was decided to travel by railway as far as possible, and no one can imagine who has not experienced it what luxurious travelling it is in Russia. The time was decided on and all preliminaries were arranged; but so important a step as a journey to Siberia is not to be treated at the fag end of a chapter, so we propose to resume the account of Ivan's adventures in a new one.

* A celebrated maker of sweets in Moscow.

TOM STANTON: A STORY OF COUNTRY LIFE.

CHAPTER II.

THE next morning Tom slept late, in spite of repeated calls from the other boys, whose rooms were near his. Prayers were over, and the servants were just leaving the dining-room as he jumped the last few steps of the stairs into the hall. Mrs. Stanton was making the tea, and received his excuses kindly. Jack was sitting on the floor by a window with his dog in his arms, while Bertie was kneeling on a chair with his elbows on the table, and was talking earnestly to his father, who seemed amused.

"Let your father read his paper, Bertie," cried Mrs. Stanton.

"But, mother, this is something really important; we may never have such a chance again!"

"What is it?" asked Tom, going towards Jack.

"Why, an old building that has been used for all sorts of things is to be pulled down to-day, and we want to take Snap down there. The men say the place is swarming with rats, and there will be a lot of dogs to catch them. Father doesn't much care for us to be there, but I think it will be fun, don't you?"

"Rather!" said Tom. "Let us hurry. How soon do they commence?"

"Oh, they are at it now, I suppose; but the things won't begin to run yet. I think father will let us go, and we shall be in very good time!"

Down at the farm they found a good many men assembled watching the demolition of the old building. Some outsiders, having heard of what was going to be done, had arrived in expectation of the fun, bringing with them a strange variety of curs, which, although held in cords by their owners, stiffened their backs and growled at each other, even breaking sometimes into open warfare. There was a good deal of noise and dust, and much rough joking on the part of the men; but, on the whole, it was an animated scene, and the boys found it very amusing. Many hands being at work, the walls began to come down very quickly; and presently out of a thick cloud of dust there came a cry of "Look out, down there!" followed by a snap from one or two of the captive dogs, and an exclamation of "Got away!" from some of the men. Then the curs were loosed by their several owners, and, apparently quite aware of what was expected from them, wandered round the heaps of bricks and mortar with ears and tails erect and sharp watchful eyes. Soon they had plenty to do, and nobly did old Snap distinguish himself, being urged on and applauded by the boys.

Amongst the spectators was a man who had brought a very ugly but clever terrier, which had done great execution with the air of an expert. His owner kept his eye on the dog, but appeared to regard all that went on more as a matter of business than amusement. He was a strange-looking fellow with very light hair and a red sunburnt face marked with the smallpox, and was clothed in shabby grey cords and gaiters, with a faded green coat and a red handkerchief wound tightly round his neck.

As the excitement began to slacken he drew near Jack, and, watching for a

glance of recognition, touched his cap obsequiously.

"Hullo, Bart, is that you?" remarked Jack, carelessly.

"Yes, Mr. Jack, it's me, and glad I am to see you two gents home again." Then drawing nearer, "Nothing in my way to-day, squire, I suppose?"

"No, nothing," said Jack, turning away.

"Because supposing you wanted a rabbit or a guinea-pig as would do you credit, or a squirl, or a pair of mice as white as milk, I know where I could lay hands on them—for you, sir, not for every one."

"No; I am getting tired of things like that. You must invent something new, Bart, if you want me to buy."

"All right, squire. You wouldn't like a little real sport with beauties like them, now, would you?"

"Ferrets?" exclaimed Jack, as two long, slim, white things were tenderly produced from the recesses of the other's waistcoat.

"Ferrets they are, and there isn't a many things in their own line as could escape them, if I give 'em the chance. Please to be careful, sir; they're apt to be a little spiteful with strangers. But there, what a treat it is to see them animals bolt their game. There ain't a prettier sight on earth. Say the word, squire; shall it be to-day?"

Jack looked round while the hoarse voice continued to speak. Bertie was not to be seen; but Tom was standing near, and turned quickly as he heard his name called.

"Look here," Jack said, and pointed to the snake-like creatures struggling in their owner's hands. Bart again touched his cap and expatiated on the merits of his pets, while Tom wondered and admired. He caught at the suggestion of sport, and eagerly proposed that they should accept Bart's offer.

Jack looked uncomfortable.

"I don't know whether father would like it," he said. "Just wait here a minute, Bart. I wonder where Bertie is?"

While looking round for his brother Jack explained to his cousin that, as Mr. Bart did not bear the most unblemished character, Mr. Stanton very much objected to the boys having dealings with him. "He is so useful that the men about here like him to come sometimes, so father does not forbid it; but I am sure he would never let us go anywhere with him."

"What a nuisance!" grumbled Tom. "That is always the way when one wants to do anything very much. Things that one likes always seem to be wrong."

"Yes, don't they?" said Jack, kicking the stones in front of him. "I want awfully to see some ferreting, but I know it wouldn't be the least use asking father."

"I suppose not. But I say, don't you think, for once, we might go without asking him?"

Jack reddened. "I shouldn't like to; and we should get into such a row afterwards when he knew it."

"Yes; but I mean, I don't see why he

should know it. Can't we just go for an hour or so this afternoon, and say nothing about it?"

"No, Tom; I don't think we can."

"I declare I must see those ferrets at work. It's capital fun, I know; and what can be the harm? We need not have anything more to do with that fellow afterwards. Oh, I say, Jack, let us manage it somehow!"

"We can't, Tom; it isn't possible. Bertie would tell you so, too, if he were here."

"Well, look here. Suppose I go and ask Bertie what he thinks? He is a good little chap, and won't split."

"Split! No; but he will say the same as I do."

"At any rate, I can go and speak to him. Just wait here a minute till I come back."

Jack sat down on a log of wood and looked gloomily at the ground. The suggestion that they should secretly do a thing so contrary to his father's wishes had disturbed him deeply. He, too, longed for the amusement offered, and sat thinking about it until he felt as if it were the only thing worth doing. As Tom said, there seemed nothing really wrong about it, and perhaps his father would not mind much when it was all over.

When Tom came back, with Bertie beside him, Jack looked inquiringly at his brother. The little fellow's face was clouded, and he listened in silence to his cousin's eager explanations.

"Yes, of course it would be fun," he said, at last; "but we can't do it, can we, Jack?"

"I don't know," said Jack, slowly; "I suppose not."

"Father would never allow us, so what is the use of thinking about it?"

"Oh, Bertie, shut up!" said Tom, impatiently. "We know that as well as you do. We want you to think of some way of managing it."

"Well, I can't, then! And if I were you I should stop thinking about it."

"Thank you for nothing!" said Tom, turning away impatiently as Bertie ran off again.

He was in a fever of impatience. Brought up as he had been by a father who idolised him and granted his every wish, he had never learnt to relinquish his own plans at the desire of those wiser than himself. Surrounded too long by the falsehood and servility of Indian servants, he had missed the wholesome training which makes a boy shrink from deceit as from dishonour. His lips lent themselves readily to something that was not quite the truth, and Jack's hesitation now only appeared to him a want of daring quite unworthy of a fellow with any pluck.

Going back to Bart, who was whistling to his ugly terrier, Tom entered into an eager conversation, after which dog and master withdrew in the slinking, agile manner of their kind, and Tom sauntered back to where his cousin was still sitting.

"Well, have you made up your mind?" he asked, with a slightly contemptuous smile.

"Yes, I have," said Jack, rising

"There was a shout from Tom."

"You will go?"

"No; not I!"

"All right, then; there is no use in saying anything more about it. Your father will be out this afternoon, won't he?"

"Yes, and mother too. They are going to drive into the town, and dinner will be half an hour later."

"That's splendid. I like a good long afternoon," and so speaking the boys went slowly back to the house.

After lunch Tom left his cousins on some excuse and did not return. While seeing their father and mother start the boys did not miss him, and it was only after some time that his prolonged absence struck them as strange. No answer

coming to their shouts, and his room being empty when they looked in, they wandered down to the farm, expecting to find him amusing himself with the animals there.

But in the meantime Tom had run off to join Bart, who had been waiting for him under a large hollow oak-tree in a remote corner of the park. Together they made their way to some hedgerows, where Tom enjoyed the pleasure which he had longed for to its fullest extent. Hour after hour passed in ever-growing excitement, and when one of Bart's snake-like hunters entered a burrow the boy watched and listened with the same eagerness as the ugly terrier which took a share in the sport.

At last the lengthening shadows reminded Bart that evening was approaching, and that he had far to go; and, turning to his companion, he suggested that it was time to return.

Tom said "All right" rather reluctantly, and took up the ferret in his hands while Bart was making arrangements for the concealment of the dead rabbits.

The man was just saying, "Don't you attempt to take the line off his neck yourself, sir," when there was a shout from Tom. For a moment the ferret was seen hanging to one of his fingers, then it dropped off, and disappeared rapidly into a rabbit-hole.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

By GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER VIII.—THE ROMANCE OF A LIFE.

"YOUR uncle, Colin McLeod," continued Mr. Mildmay, "was a favourite with every one and everywhere. It is

satisfied with any officer, and even when they are they do not often take the trouble to say so.

"Nearer and nearer came the Armed Boats."

hardly too much to say that the men in his ship all but worshipped him, while his officers not only respected their captain, but were proud of him. The admiral of the fleet had said more than once he could trust Captain Peter and his bold Bellona to do anything, and, strange though it may seem, the Admiralty at home were satisfied with all he did do. This is really strange, because Admiralties are seldom or never

"You may be sure we had plenty of fighting while we belonged to the old Bellona, both in her and out of her, both afloat and ashore.

"Captain Peter prided himself on the proficiency in drill which his crew had attained. 'They are not only fine sailors,' he would say, 'but they are jolly good soldiers. Can't be beaten, in fact.'

"I remember your uncle making use of these very words to a small intensely

respectable-looking agricultural baronet that, with his wife and family, we had saved from the Russians; we had rescued them from a sinking yacht.

"'Splendid soldiers they are, sir!'" said Captain Peter. 'Now,' he added, 'I am going on shore to-morrow morning at daybreak. You can rise early, I dare say, sir?'

"'Oh, yes,' was the reply; 'at any hour almost.'

"'Good!'" said the honest captain. 'I'm going to capture a small fort in here. You shall go with us, Sir George. It will be a treat for you, and you will then see what kind of soldiers the sailors of the Bellona are.'

"'Me go with you!'" cried Sir George, forgetting his grammar in his excitement.

"The old Bellona was engaged on special service. She wasn't a very fast sailer, but it is wonderful, after all, what we did with her. We were here, there, and everywhere, one day acting as con-

voy to a fleet of our own merchantmen—for there were pirates in those days in the Levant—next fighting a Russian frigate, and next probably on shore storming a fort.

"Those were stirring times, I can tell you, and some of the scrapes your uncle got into would have been both sad and serious had it not been that he invariably managed to get out of them all in the neatest manner imaginable. Yes, we had lots of fighting, and—although we never complained—short commons. Very often we had nothing for dinner but weevily biscuits, and what we left was fried in a little dripping for supper. The excitement carried us through, but we were all pretty war-worn.

"War-worn, but not weary. Not a bit of it! Only with the exception of the cook, who, the men said, kept up the rotundity of his person by licking the soup-ladle, there wasn't a single ounce of spare fat on any of us, from the captain to the cabin-boy. We looked positively gaunt, with semi-sunken eyes, brown skins, and high cheekbones. But our muscles were steel, our sinews like strips of machinery belts.

"At the time, then, that the Russian prize was retaken and I and my poor fellows made prisoners I was what your athletes would call in fine form, but rather under weight. The long journey inland and my sufferings by the way—for our escort was a sergeant fellow and a troop of irregular, *very* irregular, cavalry, none of whom understood a word of English—did not tend to improve my condition. You may fancy, then, how glad I was to find myself once more under a hospitable roof. And my mind was all the more easy in that the commandant of the fort had not only promised to look well after the comforts of my men, but to endeavour to effect an exchange of prisoners at as early a date as he could.

"You look, though," he added, kindly, "as if you really needed a rest, and a few months among our bracing hills will make another man of you."

"There is never any good growling, Colin, though sailors are—so they say—seldom perfectly pleased with anything under the sun, so I soon settled down to my new life, and I came in time to love it. I almost wondered how I could have been enamoured with the excitement of the existence I had previously to this been leading. The country all around the lake was exceedingly beautiful, and as wild and romantic, Colin, as any of your own Scottish glens.

"But, Colin McLeod, I may as well tell you now, although you are far too young to understand me, I fell in love with the daughter of my kind-hearted hostess, the lovely and accomplished Ana Loréna, and, sailor-like, I fear I did so from the very first moment I saw her. The commandant and I came upon her and her mother, the Señora Loréna, quite unawares. In fact, the Russian officer stalked quietly up to the casement window smoking his cigarette, and I followed. Anetta, as he called her, did not perceive me, for I was hidden by the roses that clustered around the verandah; so she merely gave one upward glance at the commandant, and a smile so sweet I had never seen on a face before—and went on with her song, a very tender one, a very plaintive one, called 'Juanita.'"

"I know it," said Colin.

"Then some day you must sing it to me. It will restore to me for a time the feelings of days long gone by, of days that were to me the happiest in all my existence. The name Loréna will strike you as being a Spanish one. My hostess was of Spanish extraction, but theirs was a very sad story. They came, or rather they had been brought, from Lima, in South America. You have never been there yet, but I have, and fain would be there again. But something tells me that I shall not live to visit that fair city any more, and this is my chief reason for confiding to you the history of the romance of my life.

"Lima is to my thinking the most charming city in the world; the scenery all about it is an earthly paradise. Alas! that it should be the scene of so much dissension and strife and periodical outbursts of war and rebellion!

"Señor Loréna had lived long in this city, and had amassed wealth, but, tired at last of the continual excitement, he determined, with his wife and only daughter—only child, in fact—Ana, to take passage to England, and there end his days in peace and quiet.

"He changed most of his bills and coupons for specie, with which he embarked in a small brig hailing from Glasgow, which he had chartered to take him to Europe, and the voyage was commenced. Little did he know then that war had broken out betwixt England and Russia. To his sorrow he knew but too soon.

"But the first part of the voyage south was all peace and pleasure; the weather and the winds were favourable. They were in the trades. The brig sailed well, and there was every prospect of a prosperous and happy voyage. One day, however, when off the wild, barren shores of Bolivia, with the land in sight and every stitch of canvas set, a large, long, raking vessel hove in sight round the point. She, too, was under sail, and from her appearance would draw at least double the water the brig did. The captain did not like her looks, and, with all his wealth on board, Señor Loréna was exceedingly nervous.

"As the large ship altered her course and bore down towards them, and as presently a ball of smoke rose up from her bows, and a shot tore past the brig's stern, they concluded she was a pirate. To fight was out of the question. Their safety lay in getting well in shore, where the other vessel could not follow them. So the brig was kept away, and two men put in the chains, lest she might run suddenly on shore. It was a strange race—a race for safety—a race for life itself.

"As the wind blew directly towards the shore, the sea broke in great rollers with all the force of the wide Pacific right upon the long low sandy beach. To ground anywhere among these would be fatal. They had the satisfaction at last, however, of seeing the great ship lie-to. She would not venture farther, and presently the brig herself cast anchor. It would soon be night, and as there was no moon, they hoped to slip away in the darkness.

Several shots were fired by the enemy, who now displayed the Russian flag, but every shot fell short. Much to the consternation of those in the brig, boats were

now seen to be lowered, no less than four of them, and were soon swiftly speeding over the water towards the brig.

"Let us fight!" cried Loréna.

"That we will," said McGregor, the captain. "My brig shall never be taken by boats as long as I have a shot in the locker."

"So the crew were armed, and the only guns on board—two brass six-pounders—were loaded and run out.

"Nearer and nearer came the armed boats.

"McGregor hailed them in English.

"Stand off," he cried, "or we'll blow you out of the water."

"The reply was a hailstorm of bullets from the small arms of those in the boats.

"Give it 'em now!" roared McGregor, as the boats still advanced.

"The brig's guns were loaded with pieces of old iron, terribly bad for the guns, Colin. But it was terribly bad for the first of those boats as well. McGregor himself laid and fired the piece, and the result was appalling. The Russian boat was literally blown to sticks, and half her crew killed or drowned.

"Stand off, now!" shouted the bold skipper, "if you don't want another dose of the same drug."

"They are Russians, sir," he continued, addressing Señor Loréna; "but if they think they are going to have an easy job capturing my brig they are mistaken."

"Is England, then, at war with Russia?" asked Loréna, anxiously.

"I fear so, sir," was the reply. "Indeed, it seems like it, and war was threatened even before I left home."

"But the Russian boats had had enough; they returned on board with their wounded. In half an hour they were back, and a kind of artillery duel commenced, the boats fighting with rockets and shells, the brig with her iron shrapnel.

"It was a most unequal fight, and ended, as it only could end, in a victory for the Russians. For in half an hour smoke was seen coming spewing up the fore-hatch—the brig was on fire! McGregor was a determined fellow, however. He got up sail and beached his burning brig, then took to the boats with his passengers and all hands, concluding he would rather brave the breakers, and land on an inhospitable shore, than trust himself to the tender mercies of the enemy.

"But fate had willed it otherwise. They were pursued and made prisoners, and in a very short time found themselves on board the Russian corvette. The brig was left to smoulder. Loréna was a poorer man now; nearly all his wealth, all his specie, was left in the burning vessel, which blew up and disappeared, every timber of her seeming to be scattered to the four winds of heaven.

"The rest of Loréna's story is soon told. The Russian ship was homeward-bound, and in two months' time the unfortunate family found themselves in the very village to which I was led a prisoner of war. They, however, were told they were free.

"Loréna was not destitute; he still had bonds to sell, and might have gone to England and settled down in ease, though not in affluence; but his wife and daughters were enamoured of the quiet beauty of the scenery in which

they now found themselves, and so they stayed in the village. They took a small farm—a rose farm—and at the time I made the acquaintance of the Señora and her daughter the father had been dead about a year; the new life had not suited him, who had been accustomed all his days to bustle and to business.

"Colin, I loved little Ana Loréna, as I have already said, from the very day I first entered her presence. But it was not till six long months after that I dared to tell her so.

"I had been out on the lake shooting wild birds; it was winter, and the ice covered the whole surface of the loch, and ducks, geese, and even black swans were abundant. In my hurry to get one of the latter, which was only wounded, I fell. Some snow got into one barrel of my gun, and when I next fired it burst. One large piece struck me on the left arm, severing an artery and making a terrible wound.

"When I recovered consciousness I was at home in the little cottage, and both Ana and her mother were tending me. I need not describe my long illness further than to say it was to me one of the sweetest periods of my chequered career, for I soon knew that Ana loved me even as I loved her. We were married in the ensuing spring in this village of roses. Ah, Colin! life seemed all roses to me then. But my happiness was of brief duration, for in less than six weeks came the order for my exchange."

The lieutenant suddenly ceased talking, and his eyes had a far-away, dreamy, even mournful, look in them when he shortly afterwards resumed his narrative.

"Go I must, and leave all I now held dear! My duty called me. Duty! I had ever looked upon it as a sacred thing, but with its sacredness there now appeared to me to be mingled something of the awful. Duty and destiny were beckoning me away. Obedience must be mine.

"Then hope came to our aid and solace. It told a too flattering tale, and for more than a week before our parting Ana and I talked about nothing else save the happiness in store for us when we should once again be reunited, never to have to say 'Farewell' any more as long as life lasted.

"On my arrival at home, or shortly after, I was appointed to a ship for service on the eastern shores of Africa. It was what sailors call 'the tail end of a commission,' so I had not to be away for more than a year.

"Never a year of all my life, Colin, passed more slowly to me than that did, yet peace was proclaimed at last, and we were ordered back to England.

"But letters during the previous two months I had had none, either from my wife or her mother.

"As soon as I arrived at Portsmouth I asked for and obtained six months' leave of absence on half-pay, and you may be sure I shipped at once for the Black Sea.

I hired a rude kind of drosky, drawn by two fleet horses, and in three days' time I had arrived at the village by the lake.

"What a scene of desolation met my gaze! The beautiful hills, once covered with roses, were black and bleak and bare, the fort was in ruins, and every house in this once smiling hamlet was wrecked and roofless.

"From a half-wild Russian peasant who was toiling in a field some distance off I learned that before the war closed a Turkish raid had been made on the village, and every living being who had not previously fled was put to the sword.

"The commandant of the fort," I inquired; "was he slain?"

"Oh, no, sir," was the reply; "he went off to a town inland a week before."

"Did he go alone?" I asked, trembling.

"Let me see," said the mudjik, laying down his rude turnover spade.

"All my hopes hung on his answer. 'Can't you remember?' I asked.

"To be sure, to be sure!" said the fellow. "Why, I went with him, and there was my wife, and—"

"Stay!" I cried, holding out a gold piece; "this is for you. Tell me now, did any foreigners go as well?"

"To be sure, to be sure! The Lorénas went—the old lady, the young lady, and the baby."

"Colin, I could have hugged that rough mudjik to my heart for the information he gave me.

"He went with me to the town whither the dear ones had gone for safety. They were not there, nor was the commandant; he, I afterwards found, had joined his regiment and was reported killed.

"I cannot think to this day of all my weary wanderings in search of her I was doomed never to see again, and in search of my dear mother-in-law and my child, without feelings that quite overcome me.

"At long last I got a clue; I found out a portion of the truth. My wife was drowned in crossing a frozen river, and her mother was left, by Heaven's mercy, to nurse and tend my child. But why had they not written to me? Where lay the mystery? It has been a mystery to me now for fifteen long years, and it was only cleared up a few days after I was appointed to this ship—a mystery, Colin, that has wrinkled my brows and whitened my hairs, and made me an old man before my time.

"Here," he continued, pulling a letter from under his pillow, "is the explanation, and a very simple one it is.

"This letter is from the commandant of the village fort; it tells me of my wife's death, it tells me that she believed me dead, that no letters arrived at the village for months before the Turkish raid, and that he, the commandant, had since found out they had been laid aside by Russian officials because they were English, and happened to be over weight!*

* Founded on fact.

It was only lately, continues the commandant, that he discovered I was still alive. But the concluding part of the letter is the most important, for it informs me that my child—my daughter—is now living in Lima with her grandmother.

"Colin McLeod, a sick man has many strange fancies, and I have at this moment a presentiment that I may never see Lima. If I should not, you must seek out the dear ones and tell them what I have told you. You promise?"

"I promise, sir; but—"

"Nay, nay; say no more. Here are some other papers; they may or they may not prove of service."

"What are they, sir?" asked Colin.

"They are sketches and maps and plans of the very spot where the brig in which Señor Loréna embarked at Lima was beached and destroyed, and where all his specie lies buried in the sand. Take them and copy them; do the work here in my cabin, where I trust often to find you. Having done so, keep the copies under lock and key, and return the originals to my desk."

"And you really think, sir, that—"

"I think nothing, Colin. Only mark this—these sketches were taken by Señor Loréna from the port of the cabin of the Russian corvette that made him prisoner. He, my father-in-law, must have thought there was a possibility of one day recovering his buried treasure.

"Go now, boy. Come to me again tomorrow, I feel tired now and would sleep."

He held out his hand to Colin as he spoke; Colin pressed it, and silently drew aside the door-curtain and retired.

He did not go on deck again, but forward on the main deck, where he could walk about and ponder and think upon all he had heard.

He felt singularly interested in this kind-hearted lieutenant, who talked in such a fatherly way to him. He felt drawn towards him—felt he was really beginning to love him.

Colin met the doctor next morning coming aft from the sick-bay, and inquired about his patient.

"Getting on wonderfully well," was the reply. "A great change for the better since yesterday. He has had a critical sleep."

Colin was greatly relieved.

It was indeed a critical sleep that Mildmay had enjoyed. His mind had been in some measure relieved from having told Colin his story, and nature had commenced the healing process immediately.

When Colin was sent for that forenoon to Mr. Mildmay's cabin he found his friend sitting up in his coat, calm and quiet and cheerful.

"Come along, young man," said Mildmay; "I want to see you begin to make those sketches 'right away,' as the Yankees say. Sit down."

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE FOUNDERING OF THE CAPTAIN.

Since the days of the Royal George the British Navy had sustained no such disaster as that which befell it when, in September, 1870, the Captain turned keel upper-

most in the Bay of Biscay, and foundered with nearly five hundred men. She was a new ship, a costly experiment, and the controversy which had raged while she was

being built had apparently been lulled to rest by her successful trials. She was the pioneer of the turret-ships, the first sea-going monitor, built according to the designs of

Captain Cowper Coles, who shares with the famous Swedish-American Ericsson, and, according to some accounts, claims priority over him, in originating the fortress class of warship.

It is hardly fair, however, to say that she was designed by Captain Cowper Coles, for after years of worry he had succeeded in forcing our Admiralty to have the ship built, and the Admiralty officials introduced such modifications into the original plans as practically made the Captain nobody's child in particular. And these alterations affected

she was on her beam ends, acted as an enormous sail and prevented her ever recovering herself.

Her officers were the pick of the Navy. In command was Captain Hugh Talbot Burgoyne, V.C., the son of Field Marshal Sir John Burgoyne, and among her officers were the son of Mr. Childers, then First Lord of the Admiralty, a son of Earl Northbrook, and a brother of the Marquis of Huntly, and on board as a passenger was her originator, Captain Cowper Coles. The survivors were the gunner, Mr. May, and seven-

fleet were counted all safe; when day broke there were only ten of them—the Captain had disappeared.

A storm had come on, and about midnight, just after the starboard watch had taken charge, a squall had struck the monitor and heeled her over. She was at the time under snug canvas on the port tack, close-hauled. The captain was on deck, and gave orders to "Let go the foretopsail halliards!" and then "Let go the fore and main topsail sheets!" but before the men could get to do so the vessel had gone over so much that

H.M.S. Captain in the Bay of Biscay.

her in two vital points—in the enlargement of her sail plan and in the decrease of her freeboard; and the freeboard was still further decreased by an error ascribed to the builders, so that when the ship was launched she floated twenty-one inches deeper than had been calculated.

She was a double-screw ship-rigged ocean cruiser of 4,272 tons; she was 320 feet long by 53 feet beam, and had engines of 900-horse power. She had six guns, two 6½-ton guns unprotected and four 25-ton guns, two in each of her turrets. Her armour ranged from eight inches in thickness down to three inches. She had a very low freeboard so as to allow the guns to be worked all round, and a high poop and forecastle, connected by a hurricane deck, the bottom of which, once

teen of the crew. The rest, 480 in all, were drowned.

It was not her first passage across the Bay, for she had been twice to Vigo before she foundered, and in her early cruising had behaved so well that many who had been prominent in asserting that she was unseaworthy had admitted that they had been mistaken. The disaster occurred on the 7th of September, 1870. She was cruising with the fleet under Admiral Milne, and the admiral had been on board during the day conducting his inspection, so that the crew had been through a prolonged drill. In the evening the admiral, declining to dine on board, had left for his flagship, and his galley had been nearly swamped alongside as he went away. As the night closed in the eleven sail of the

they were washed away. A furious sea struck her before she could recover, and on to her beam ends she went. For an instant she floated on her side, and then she slowly turned bottom upwards. She remained for a few minutes rocked on the waves, and then sank stern foremost with a tremendous explosion.

As she turned the water rushed down her funnel, and a loud roar began, which continued for a short time. And above the din were heard the shrieks of the stokers, for the probability is that the fires were shot out into her stokehole. Her boilers were fired athwart her, and the stokers, lying or standing on the starboard boiler-fronts were, there is only too good reason to suppose, covered with the blazing fuel, which must have forced the

furnace-doors open with its weight and filled the ship with smoke and flame.

The catastrophe was so sudden that there was no time to give warning below. Of those who were saved all belonged to the watch on deck with one exception—a seaman named David Dryburg. He had felt the ship heel over, and, fearing that she would not right again, had made a desperate rush and got to the weather hammock nettings as she laid on her beam ends. And then, as she kept turning over, he slowly scrambled up her side until he reached the spot where her keel would have been if she had had one. From here the seas washed him off, and finding one of the boats drifting past he clung to it, and was saved.

A strange experience! But not much stranger than that of Admiral Hope, who, curious to relate, was the president of the court-martial which conducted the inquiry into the loss of the Captain. He was on board H.M.S. Racer in 1836, when she capsized in the West Indies. With others he had been on her side as she lay on her beam ends, and on her keel as she turned mast downwards, and as the hull rolled over—for the Racer actually righted herself—had scrambled down again over the bulwarks and on to the deck as the ship resumed her normal position!

Some of the Captain's boats broke away. To one of them—the steam lifeboat pinnace, which was floating keel upwards

—Captain Burgoyne and four others were clinging as the canvas-covered galley and launches came drifting by. The gunner and some of the men jumped on to the nest of boats, cut the canvas away, and threw the galley out, and then the first launch floated from underneath the second, and the oars were got out in the second launch to take off the captain, who was still with the pinnace to windward. All efforts to get the boat up to the wind proved useless. The furious sea threatened each instant to swamp the boat, and when her head was turned to windward the waves swept in, filled her to the thwarts, and washed two of the men out of her. The pump was set going, and the men baled away with their caps, and again the boat was turned towards the pinnace, but to no purpose. One of the men was going to throw his oar to the captain, but the captain stopped him with, "For God's sake keep your oars, men; you will want them!" All had left the pinnace but himself. He had remained to the last, refusing to jump till his men were in safety. The last man that left his side had asked him if he was going.

"Come, sir, let us jump!"

"Save your own life, my man; jump and save yourself! I shall not forget you some day!"

And the seaman jumped to the galley and was saved, while the captain remained—to die.

His country could ill spare him. As one

who led, but did not drive, his men, he was very popular, and although very young for his command—only thirty-seven—there was no more accomplished sailor in the service. He had entered the Navy in 1847, and risen to be commander in nine years. In fact, the story goes that when appointed to the Ganges the Admiral had told him he was too young, and requested him to refrain from entering on his duties until he had communicated with headquarters—which Burgoyne had firmly but courteously declined to do, on the ground that he would not have received the appointment unless the authorities had expected him to set to work immediately.

As the gunner and his men were tossing about in their boat the Inconstant went driving past them in the gale. Their wild shout of "Ship ahoy!" was unheard and unheeded, and, knowing that the coast was to leeward, they gave up all hope of being rescued by the fleet, and made for the land, which they reached at Corbucion, near Finis-terre, whence they were brought home in the Volage.

The news of the loss of the Captain arrived when the country was in the throes of excitement over the surrender of the French Emperor at Sedan, and at once it superseded even that great event in interest. It was indeed appalling to lose such a ship and crew so suddenly and completely; and the monument in St. Paul's Cathedral to those who perished speaks truly of the nation's grief.

BOY LIFE AFLOAT.

II.—THE GRATINGS.

FLOGGING is now entirely abolished in both the navy and army, and boys who have once passed from the training ships will never more run the risk of having their better feelings hardened or deadened altogether by being compelled to witness and assist at one of the most brutal exhibitions of man's cruelty to his fellow-man.

It is impossible to describe the effect of a spectacle of this kind upon a youth fresh from all the kindly and softening influences of home.

We have ourselves witnessed a soft-hearted and emotional youngster affected to tears at the sufferings borne by a seaman while undergoing this degrading and cruel punishment, while it is a well-known fact that youths who have afterwards turned out brave as lions when fighting for their Queen and country have actually fainted while assisting for the first time at a flogging.

For some years the punishment of the cat had been reserved for the most serious offences, but there is no doubt that under any circumstances it was a mistake to grant the power of inflicting such a terrible punishment to one man, who might be a tyrant, cruel by nature, or even if he were not so was at all events liable to error, prejudice, and mistakes.

As a case in point, in which we truly believe that an innocent man was punished, we will relate the first flogging it was our misfortune to be present at.

It was in 1865, and we were serving on board a corvette on the coast of Africa. She had only lately been commissioned, and the men had not become thoroughly accustomed to one another and to their officers, or, as they say at sea, they did not yet "pull together."

One evening, as is usual after quarters, we were practising the men with "sail drill;" reefing topsails, we believe, was the work being carried out.

The yard had to be lowered, the men sent up aloft, the reef taken in, and then the yard hoisted again.

Of course the object was to get this all

done in the shortest possible time, and very often it had to be performed over and over again until the captain was satisfied with the manner in which the operation was conducted.

In order to attain the desired end it is necessary that every man should know his duty and do it smartly and with all his power.

The officers have to see that the men carry out the orders given promptly and efficiently, encouraging or scolding them as the case may be.

The reef had been taken in, and the yard was being hoisted once more, but the second lieutenant, who was standing by the mainmast, did not consider that the men who were hauling on the maintopsail halliards were working properly.

"Pull away, men!" he cried, excitedly, wishing to get the maintopsail yard up before the others, "put some strength into it! Fall back on it!"

Then noticing one man in particular, a marine named Hopkins, he added,

"Why don't you haul, Hopkins? You're not pulling a bit!"

The man muttered something in reply, which, what with the noise and excitement, must have been somewhat difficult to catch.

He always said that he replied "I am, sir." But the lieutenant maintained that he swore at him, using a word that has very much the same sound.

He reported the man, who denied the charge, making the excuse we have mentioned, but of course his word could not be taken against that of his superior officer. Unfortunately for him also he happened to bear a bad character as a lazy idle fellow, and only the previous week it had been found necessary to shave his head on account of his want of cleanliness. Of course this went against him, and he was found guilty of insubordination, and sentenced to receive four dozen lashes.

The following day the sentence was carried out as follows. A big grating was securely fastened to the side of the ship in

the gangway, and another one placed on the deck for the victim to stand upon. The boatswain's mate then piped the "hands" to "witness punishment." The seamen all gathered forward, the marines were drawn up under arms with fixed bayonets, and the officers in full uniform congregated aft.

Then the captain appeared, and the first lieutenant having reported "all ready," the prisoner was sent for.

The captain now read the particular article of war that the man had infringed, and we all listened bareheaded. Then followed the warrant and the sentence, after which the prisoner was "seized" up.

This was done by fastening his wrists and ankles to the upright grating with a species of webbing in such a manner that, his hands being stretched out over his head and his feet stretched apart, he could not move an inch to avoid the blows of the cat.

A piece of canvas was then fastened round his waist, and another round his neck for protection, thus leaving the whole of his back bare for the infliction of the torture.

The first boatswain's mate was then ordered to "lay on." He removed his jacket, and taking the cat, measured his distance, and swinging it well over his shoulder, brought it down on the prisoner's back.

The cat consisted of a small wooden handle about two feet in length, to which were fastened nine long pieces of thick white line, about the size of coarse whipcord, but harder in consistence.

The first stroke left nine red marks, the seventh tore the skin, and the blood began to spurt forth amid the howls and yells of the poor wretch who was suffering the punishment.

At the end of twelve lashes a fresh boatswain's mate stripped and went to work, administering the next dozen.

After this every cut brought away portions of skin and flesh, and the victim's shrieks for mercy were heartrending to listen to.

The master-at-arms counted "thirty-nine," when the man's head dropped on to his shoulder, his cries ceased, and he fainted.

The doctor, who was standing by me, immediately attended to him, and by his directions he was cast loose and carried down below.

He was in his hammock in the sick-bay under the surgeon's care for some weeks, and then the captain, having remitted the remainder of his punishment, he returned to duty.

But this, although disgusting and brutalising enough to all conscience, was nothing in comparison to the really awful punishment of "flogging round the fleet."

This was awarded to men who had been guilty of some crime legally punishable by death, but who, through extenuating circumstances or any other cause, escaped the capital sentence. In many cases, however, death would have been preferable, for it generally ensued, after lingering torments impossible to imagine or describe.

This torture—for it can be called nothing else—was carried out in the launch of the ship to which the prisoner belonged. A grating was erected in the middle of the boat, which contained, besides a party of armed marines, a surgeon, master-at-arms, two or three seamen to attend to the victim, and an officer in charge. This boat was then taken in tow by the boats of the fleet, and towed from ship to ship.

Alongside each vessel it was made fast, while the boatswains' mates came down and administered their four dozen lashes, the rigging being manned by the crew in order to witness it.

A flogging round the fleet was generally considered to be equivalent to *five hundred lashes*, so that it is no wonder that so few men ever survived it, and that those who did were broken-spirited cripples or imbeciles for the remainder of their shortened life.

Let us be thankful that this blot upon our naval glory has been removed, and that "rigging the gratings," as a preparation for a flogging used to be termed, is a thing of the past.

THE SALT-WATER AQUARIUM.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

WHAT a pity it is that at least nine out of every ten of those who take up the sea-water aquarium, whether as a mere object of amusement, or with the intention of learning some of the mysteries of nature, should relinquish their task before many weeks have passed away! Perhaps the inmates die, one after another, without apparent cause, or the water loses its natural clearness, and gives out an odour of a painfully disagreeable character. Or, maybe, one of the larger captives takes advantage of his superior size and strength, and proceeds to dine upon his fellow-captives, thus speedily depopulating the tank. Whatever the particular cause, however, the aquarium gradually ceases to interest its owner, and ere long is put upon one side, never to be again received into favour.

And yet there is not one of the above calamities which might not have been averted at the expense of a little time and trouble. A fish or other small creature died, perhaps, and was not removed until it had begun to putrefy, and so contaminated the water. Carelessness. Or superfluous fragments of meat, etc., used in feeding the prisoners were left to decay, and so brought about the same result. Carelessness again. Or some savage and voracious creature was placed among a number of gentle and inoffensive companions, like a wolf in a flock of lambs, and naturally took advantage of its good fortune. Once more, carelessness. If a little daily attention is but paid to the vessels, there is no reason why the possessor of an aquarium should ever be obliged to complain that he is unable to keep his captives for very long in a healthy condition.

And there is another important point which ought to be considered—namely, that unless these same captives are in perfect health, very little pleasure or instruction can be gained from watching their habits. Every movement is as listless as those of a school-boy suffering from a severe bilious attack, or a very bad cold, and gives one no idea whatever of the life and fire which may characterise the same animals under more favourable conditions. The more carefully, therefore, that their wants are provided for, the more natural will be the doings of the prisoners, and the greater the pleasure to be derived from watching them.

Now for some practical directions, beginning, of course, with the vessels to be employed.

The character of these naturally depends very much upon the purpose which they are intended to fulfil. If it is desired merely to watch the habits of the various marine creatures in the solitude of one's own apartment, pie-dishes, earthenware pans, jam-pots, almost anything, in fact, will answer perfectly well. But, if the aquarium is to be a drawing-room ornament, and therefore a thing of beauty as well as a serviceable article, some structure in which glass plays the principal part must of course be chosen.

At most of the shops devoted to the sale of natural history apparatus, and at many glass-cutters' as well, may be procured certain oblong tanks, which, if not too deep, will answer our requirements in a perfectly satisfactory manner. There is one great disadvantage about them, however, and that is that they admit far too much light. Most of the inhabitants of the ocean, it must be remembered, either live at depths to which the daylight can only partly penetrate, or else escape the unwelcome sunbeams by retiring into the various nooks and crannies furnished by sunken rocks, seaweed, etc. So, before making use of our tank, it will be as well to cover three sides with sheets of cardboard, which regulate the allowance of light, and which can be removed when it is required to inspect the contents.

(To be continued.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

VI.

I MUST now, I find, wind up my line again, and return to practical considerations. You have been informed about angling with the single-handed rod, and if the directions are followed with any degree of intelligent appreciation the tyro will not fail to become efficient in so far as their scope extends. A few remarks must, however, be made in reference to fly-fishing with the double-handed weapon, for are not some of our best fly-fishers, notably Mr. Francis Francis, advocates of the double-handed in preference to the single-handed rod?

Now, the double-handed rod is usually about sixteen feet long unless salmon is the fish it is used for. Even then sixteen feet is ample length for most of my readers. For trout-fishing, however, from fourteen feet to sixteen feet is a good length, and the precise measurement is adjusted to your height and strength. It is useless to think of using a rod which will absolutely tire you out in an hour or two, and so if I may be allowed to judge for you I would send to Foster of Ashbourne for a light split-cane weapon—if you intend, that is, to use the two-handed weapon.

There is but little modification to be made in the directions already given as to the method of using this longer rod. We have sufficiently indicated the position of

the hands, etc., and it is nice to acquire the knack of ambidexterity which was insisted upon by the late Mr. Charles Reade some years ago. His opinion was that the "Coming Man," as he termed an ideal personage hereafter to be born, was a person who would use both his right and left hand with equal ease—that, in fact, as with gymnasts, each boy and girl should be taught that both hands are equal in strength and dexterity if properly used and developed. Now, in my eyes this is an incontrovertible theory, and I have myself reduced it to practice in the throwing of a line, and in fact in fishing generally. I advise all boys to try and do the same. It is a great relief to be able when fishing to relieve the one-sided strain by changing over. It strikes me we should hear less of partial paralysis if this ambidexterity were urged upon all systematically.

The advantages of a double-handed rod are, first, greater command, within certain limits of course, of the direction of the fly, and a greater power of long casting. Rennie, as I told you, says that eighteen yards can be thrown with a double-handed rod. But this is far behind what has been done recently. At the casting tournament before referred to the following scores were made, and my readers may judge of their superiority to those of the learned professor who edited "Walton and Cotton":—Major Traherne 45 yards, P. Mallock 43 yards.

So far I have only adverted to the ordinary style of casting, or the overhand, as it is termed. There is one other style which is most useful, and which every tyro ought to be master of before he can fairly call himself an artist, and that is the Welsh or Spey cast. Though it is specially favoured by salmon-fishers, it is extremely useful to the trout angler when there are many obstructions, such as bushes, boulders, or what not, fringing the river's bank. The line is brought up and whisked off the water by an upward and backward movement of the rod and delivered forward again before the line is quite off the water by a forward and lower movement of the upper part of the rod. This throw is always very serviceable when there are impediments of whatever nature in the way, and so some of the best fish of a river are brought under "fire," as Foster, in the "Scientific Angler," terms it. The test of skill in a trout-fisher is the capture of a fish which lies in a spot apparently impregnable, and this cast is one of the dodges by which such an ultimatum may be attained.

Though the general *modus operandi* of fly-fishing for trout has been pretty completely indicated, there are yet several points on which it is advisable to say a few words. One of them, the subject of *striking*. In a former part of this series I said, "Mount your rod; do not strike," and the advice was sound under the circumstances. A young angler will, if advised to strike, invariably in the excitement of the moment strike too hard and lose his fly, perhaps break his casting-line, and in any case lose his fish. Hence it is that Ogden of Cheltenham, a famous dry-fly fisherman in his day (indeed, he claimed to be the inventor of the method), advocated no striking to the young beginner. But an equally great master of the art—also gone to the Spirit Land—who during his life was styled the "Amiable Angler of Dovedale"—I mean Foster of Ashbourne—this angler, I say, deemed it certainly advisable that the learner should acquire the knack of hooking his fish in an effective and skilful manner. This he advises should be a short, quick wrist motion, commenced sharply but ended almost instantly and abruptly, like a quick movement of the hand in bringing a foil in fencing from *tierce* to *carte*. The hand holding the rod is turned upwards and backwards whilst the arm is stationary when a short line is out, the movement being lengthened when the intervening line is either long or loose.

(To be continued.)

DOINGS FOR THE MONTH.

JUNE.

THE POULTRY RUN.—If everything has gone well in your run, and you have attended to the hints we have thrown out from time to time, you ought now to be getting plenty of eggs. You will have ducks and chickens ready for the market, and over and above all this we trust that you may have more than one bird giving promise of show qualities. You will carefully separate any very fine birds from wasters, and be extra good to them. The best birds we ever bred were black games, that we had made actual pets of. So please take the hint. Probably you do not intend to show, nevertheless you would like to see beautiful birds about your place—fowls that even a judge could find few faults with.

Now that eggs are plentiful you ought to preserve them for winter use. They may not eat perfectly fresh, but then they will be a vast improvement on the ordinary shop eggs. As soon as the eggs you want to preserve have been laid they must be stored. This indeed is one of the secrets of success. Put down in a box a good layer of bran, say three or four inches. Place this box in a cool, dry cellar, and rub each egg well over with lard before you place it in its situation, then cover up. Fine dry sand may do as well as bran. The French varnish eggs with a mixture of linseed-oil and beeswax. But after all, the main thing is to keep the air out. Now in June, if you take the trouble, you will be able to find out the best laying hens; and if it be eggs alone you go in for, you should breed from these. There is a great deal in pedigree or strain. If you once get on to a good laying breed you will find it very profitable, and you will be getting eggs when the fowls of other folks are doing nothing but eating their heads off. If you have broody hens that you care to sit, place good eggs under them, and if so minded these may be ducks' eggs or those of the bantam. If you do not wish the fowls to sit, then you must put them under a basket for a night and day in the dark, but do not be cruel.

Did we mention lately that a sitting hen should have a dust-bath? It is most important, as it keeps down the insects, which have a tendency to prevent even the growth of the young chickens. It is best to let the hen come off when she has a mind to; but if sitting too close, and positively starving herself, she had better be taken off in the evenings. If you—and no doubt you will—save any money now, lay up a fund for improvements.

Attend well to the feeding; see that the fowl-house is properly ventilated, and that no rotting vegetable matter or sloppiness of any kind be left about the run, for diarrhoea is apt to occur from bad smells. Be very particular as regards the cleanliness of the nests. See that the perches themselves are clean, and not damp and slippery, and that they are so placed that droppings cannot fall on the nests beneath.

Go in now for limewashing and general disinfecting. We ourselves use Sanitas, but carbolic acid and water does good if used in places beyond the chance of its doing the fowls any harm.

Be very careful to give plenty of fresh water—soft, not hard—and place the drinking utensils quite out of

the sun, but still in a position where they can be seen and reached by the inmates.

Fatten cockerels that are old enough. Put down gravel, old lime, etc., in the run. See again to the dust-bath. Do not forget that the more often the water is changed now, and the cleaner and sweeter the dish, the less chance there will be of disease breaking out.

THE PIGEON LOFT.—The same amount of attention with regard to the comfort and cleanliness of the loft must be maintained as we advised last month. Have no slop, no dust, no dirt; have free ventilation without draught, plenty of clean water in clean, well-rinsed fountains; and plenty of wholesome, easily-digested food in the hoppers. Read our last DOINGS, and even those that went before, and whenever you find a good hint pop it down in your note-book. A note-book is easily kept, and is most valuable if it be indexed. If it be not indexed it is worse than useless, it is then like Paddy's garret—everything is uppermost, but nothing is at hand.

Your birds will now enjoy their bath. Well, it must be a clean one. You must rinse it out and put fresh water into it every evening.

Another thing that must not be forgotten is the so-called salt-cat—a mixture of old lime from walls, bay-salt, and brine. The birds, if confined to the aviary (and if they be very valuable they will be so confined), should have green food within their reach; a grassy turf or two does well.

If they have a nice outdoor aviary it will be well now to put some shelter from the sun over a portion of it; an old sack or piece of old canvas of any kind will do very well.

Do not forget a good supply of gravel. If you have spare time and think of going in for showing, you might now devote it to getting baskets ready for travelling purposes.

About this time of year pigeons are apt to be troubled with vermin; a little mercurial ointment rubbed about the neck is the cure, but it is a good plan to have a summer limewashing and thorough disinfecting of the loft. Only this must be done so as not to disturb the birds at all.

Pine sawdust which has been steeped in paraffin-oil is often put in the nest-pans with great advantage, and over this the ordinary nesting-material, straw or otherwise. The sawdust may be renewed when the young are two or three days old. This keeps down fleas. So will sawdust that has been steeped in strong quassia water.

THE AVIARY.—Wean the young gradually on to seed, with, however, as much dispatch as possible. If you have many birds breeding, nests will be hatching fast, and you cannot devote too much attention or time to your little favourites. Feed well. Give a bath daily. Give clean water daily, putting a rusty nail or a little bit of saffron in the water if you think there is any necessity. Do not forget the green food. Do not give it wet, however. It ought to be fresh, but not wet.

Be particular about cleanliness. Mites in breeding-cages are a great affliction, and can only be kept down by perfect attention to cleanliness.

THE RABBITRY.—Read over last month's DOINGS, and try to profit by them. Your rabbits ought now to be as happy as the day is long. If there be any one ailing take it out at once and put it by itself in an extra hutch, and keep it warm, feeding on the best of grains and roots, with a mash of some kind once a day. Rabbits suffer from a variety of ailments, when not properly attended to; it should be borne in mind that all their diseases may be attributed to one or other of the following causes, leaving infection out of sight—want of proper food, irregularity in feeding, wet green food, damp, bad-smelling bedding, and over-confinement in close, unwholesome hutches.

THE KENNEL.—"What does it cost to keep a dog?" is a question often asked by boys. Well, small dogs, such as terriers—and, indeed, any dog from the size of a collie downwards—will be maintained easily enough on the scraps of the table. But these must be collected and made into a nice substantial meal twice a day, with milk or gravy, and always given fresh, for dogs are not pigs. Kept thus, the dog's food is hardly missed. A mastiff or St. Bernard requires biscuits, horseflesh, boiled paunches, boiled liver and lights, etc., and only boys who have plenty of pocket-money can afford to keep such animals.

DOMESTIC PETS.—We mentioned the other day pigs as pets. They are not very elegant, but if regularly washed it is wonderful the sagacity they show. But a duck or a goose, if made a pet of, affords the greatest amusement. They will follow like dogs, and show a very large amount of affection for master or mistress. Feed very often, give dainties, and do not let your favourite be fed by any one but yourself, and you shall see what you shall see.

THE KITCHEN GARDEN.—Plant out your autumn stock of greens, cabbages, kail, etc. Keep down weeds. Water in the evening whenever needed. Earth up potatoes. Attend to your lettuces, your celery, marrows, etc. Sow turnips, beans, and peas again.

THE FLOWER GARDEN.—You can still go on planting out annuals. Attend well to the beds, the walks, and borders. Give a liberal allowance of old manure to anything you put down. Go on making pretty improvements in basket-work and boxes for flowers. If you have a summer-house covered with creepers see to their arrangement for effect. Mulch rose-trees. Cut grass and trim lawns.

THE WINDOW GARDEN.—This should now be most lovely both outside and in. Those boys who have no window-boxes should not hesitate to make them even now, fill them with good mould, and plant them. Study your neighbours' plans, and imitate. The charming canary creepers may still be put in. They soon run up now, but water must not be forgotten.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

Illuminating Competition.

(Continued from page 527.)

MIDDLE SUBDIVISION (ages 14 to 16).

IN consequence of the great number of Illuminations received in the Middle Division, and the excellence of much of the work, we have made a Subdivision of all ages from 14 to 16, and awarded Special Extra Prizes as follows:—

Prize—21s.

ROBERT E. MINTERN (aged 15), 28, Knowle Road, Brixton, S.E.

Prizes—10s. 6d. each.

ROBERT S. BALFOUR (aged 15), care of Miss Stevenson, 5, Athol Place, Edinburgh.

WALTER J. TAYLOR (aged 14), 49, Canonbury Road, Islington, N.

R. D. WARRY (aged 15), 23, Annandale Road, Greenwich.

Certificates.

MYLA E. ELKINS, 14, Culworth Street, North Gate, Regent's Park, N.W.

ARTHUR E. BROWN, 68, St. Giles's Plain, Norwich.

CHARLES J. LENTON, 17, Grey Road, Walton-on-the-Hill, Liverpool.

ERNEST EASON, South Street, Sherborne, Dorset.

WALTER ALLOTT, 64, Monson Street, Lincoln.

CHAS. A. WALKER, 17, Millgate, Wigan.

ALBERT HILL, 15, Green Hill, London Road, Worcester.

JAMES H. BOWES, Francis Street, Elland.

GEORGE W. COLE, 12, Plimsoll Street, East India Road, Poplar, E.

ALFRED R. PIGOTT, 4, Northfield Terrace, Cheltenham.

ALLAN R. MENZIES, 34, Grove Street, Newcastle-on-Tyne.

NINA TURNER, The Poplars, Deddington, Oxon.

JAMES G. GIFFORD, 25, Rose Street, Aberdeen.

ALEX. W. JONES, Brampton Brian, Herefordshire.

FREDK. G. STROHMENGER, Bonnlund Villa, 7, Quadrant Road, Canonbury, N.

J. B. WILSON, 45, Ewbank Street, Stockton-on-Tees.

FRANK P. CHAPMAN, 42, High Street, Dover.

GEORGE J. JACK, Drylaw Cottage, Davidson's Mains, Edinburgh.

GEORGE A. NICOL, 24, Loanhead Terrace, Rosemount, Aberdeen.

CHARLES E. TRINGHAM, 53, Commercial Road, Hereford.

GEORGE A. HILL, 2, Marlborough Avenue, Princess Avenue, Hull.

GEORGE E. NERVES, 39, Ondine Road, East Dulwich, S.E.

CYRIL BERTRAM BYERS, 5, Addison Road, Bedford Park, Chiswick.

ERNEST F. SHERRY, 4, St. John's Hill Grove, New Wandsworth.

BASIL W. BRADFORD, care of Rev. H. J. Wiseman, 1, Albert Road, Clifton, Bristol.

THOMAS PRATT, 4, Roslin Terrace, Southfield Road, Wandsworth.

ARTHUR H. ALFORD, 332, Liverpool Road, Islington.

GEORGE P. GOULD, Fairfield, Pinhoe, Exeter.

ALLAN MACQUARRIE, 3, Ford Place, Finnart Street, Greenock, N.B.

JOHN PEDDER, 13, Somerset Place, Bath.

CHARLES D. RUDGE, 19, Edwardes Street, Balsall Heath, Birmingham.

TOM PENDLEBURY, 82, Bonner Road, Victoria Park, E.

G. P. MORRIS, 17, Viaduct Street, Bethnal Green Road, E.

JOHN K. GARIOCH, 367, Essex Road, N.

JOHN BRAND, Upland Kinnoull, Perth.

JOHN R. BATEY, 12, Cromwell Terrace, Hanson Lane, Halifax, Yorkshire.

ARTHUR H. BRITTAIN, 31, Sterndale Road, West Kensington Park.

G. CRICHTON JACKSON, 1, St. George's Terrace, North Road, Plymouth.

DAVID BROOKS, 1, Acacia Place, Acacia Road, St. John's Wood.

G. W. HOWARD, 124, Caledonian Road, King's Cross.

J. W. RICHARDSON, 7, Elder Villas, Aickland Hill, Lower Norwood.

LXIE B. GILLESPIE, School House, Bonnybridge, Stirlingshire.

H. BAGGS, 200, The Grove, Hammersmith.

WILLIAM E. READ, Abbey House, Abbey Green, Bath.

WILLIAM R. PICKLES, 63, Whetley Lane, Bradford, Yorkshire.

ALBERT E. HINDE, The Studio, Huntingdon.

HERBERT G. CLAYDON, 7, Stokes Croft, Bristol.

W. F. WILSON, Endcliffe Avenue, Sheffield.

HARRY BAKER, Hope Cottage, Bury Street, Fulham Road, Chelsea.

EDWARD C. LONG, Police Station, Newmarket, Cambs.

A. HAINES, Roddhurst, near Kingston, Herefordshire.

JOHN MACBETH, Dalrymple, Ayr.

CHARLES ANDERSON, Nursery Road, Sunbury, Middlesex.

Correspondence.

A SPURIOUS BOY.—We cannot give news, as we go to press so long beforehand that the news would be all out of date. We have something of the sort, however, under consideration.

A SKATING NOVICE.—Try Goodman's "Fen Skating," published by Sampson Low and Co.

COUNTRY BOY.—To give the information you ask would be simply copying out pages 246 and 247 of Whitaker's Almanack; and you may as well get the book for yourself, price one shilling, from 12, Warwick Lane, Paternoster Row, E.C.

ROB ROY CANOE.—The best book on boats, is Mr. Dixon Kemp's twenty-five shilling "Yacht, Canoe, and Boat Sailing," published at the "Field" office. There is a half-crown practical manual of "Boat and Canoe Building," published at 170, Strand. You would get a list of other books on the subject from C. Wilson, Nautical Warehouse, Minorities.

PEDESTRIANUS.—There is no reason why a healthy lad should not walk 113 miles in easy stages of under twenty miles a day. The great secret is to start early each morning, and have plenty of rest in the early part of the night. Early to bed and early to rise, in fact.

D. C.—To blacken paper for drawing on in white warm it on the top of a stove, and rub it over with beeswax until it is completely covered with a layer of equal thickness. Then smoke a piece of glass in the candle, and when it is quite cold lay it on the waxed paper and rub it well down on it. You will have a surface on which, with a needle or pen, you can trace white lines as fine and clear as you wish.

FILIUS.—The "Language of the Restless Fays" was in the third volume, pages 294, 309, and 472. The numbers were in the February and March parts for 1881.

R. CORNER.—We ought to be much obliged to you for sending us for insertion the puzzle which we published in 1881, on page 327 of our third volume!

H. TRUEMAN.—1. Several species of *Papilio* are known as Swallowtails; *P. Machaon* is one of the best-known. 2. In Wyman's Technical Series you will find an admirable manual on electrotyping. Apply for list to 29, Great Queen Street, Long Acre.

E. W. B.—In the third volume there was a series of papers on Entomology for the month in which the subject was treated; and in the first volume there was a long series on killing, setting, and preserving.

DOLPHIN.—Read our articles by Mr. Harrington Keene; and then get "Float Fishing," by J. W. Martin, price two shillings, published by Sampson Low and Co.

W. E. PINK.—See "The Building of the Swallow, or How to Make a Boat," on page 149 of our second volume.

A WOULD-BE SOLDIER.—There is no such book published. The nearest approach to it is our coloured plates of "The British Army," "The Volunteers," and "Our Military Bands."

SPECIAL NOTICE.

This year, as last, we purpose issuing a

SPECIAL EXTRA
SUMMER NUMBER

of the BOY'S OWN PAPER, to consist of sixty-four pages, devoted to Seasonable Stories, Sketches, Articles, etc., etc., the whole fully illustrated by the best artists.

This Special SUMMER NUMBER will be issued with the July Part of the "Boy's Own," and will

cost 6d. All our readers should endeavour to secure a copy.

As it is intended to print only a limited number, readers who would ensure obtaining copies are strongly advised to give their orders to the Booksellers AT ONCE, by which means they will of course obtain precedence over the ordinary purchaser. Readers who failed to do this in regard to our last Christmas Number found themselves unable to obtain it, and the very same thing is not at all unlikely to occur in regard to this SUMMER NUMBER, which will not be included in the bound volume.

THE BOY'S OWN PAPER

MAJOR-GENERAL CHARLES GORDON. C.B., R.E.

From water-colour drawings by Alfred Pearse.

GENERAL LORD WOLSELEY. G.C.B., G.C.M.G.

No. 334.—Vol. VII.

SATURDAY, JUNE 6, 1885.

Price One Penny.
[ALL RIGHTS RESERVED.]

REGINALD CRUDEN: A TALE OF CITY LIFE.

CHAPTER X.—“WILL YOU WALK INTO MY PARLOUR?” SAID THE SPIDER TO THE FLY.”

“What made you think you would suit us?”

THE two days which followed the dispatch of the letter to “Omega” were long and anxious ones for Reginald Cru-

den. It would have been a great relief to him had he felt free to talk the matter over with Horace; but somehow that

word “confidential” in the advertisement deterred him. For all that, he made a point of leaving the paper containing it

in his brother's way, if by any chance the invitation to an additional £50 a year might meet his eye. Had it done so, it is doubtful whether Reginald would have been pleased, for he knew that if it came to selecting one of the two, Horace would probably pass for quite as respectable and considerably more intelligent a young man than himself. Still, he had no right to stand in his brother's way if fate ordained that he too should be attracted by the advertisement. He therefore left the paper lying conspicuously about with the advertisement sheet turned toward the beholder.

Horace, however, had too much of the "Rocket" in his business hours to crave for a further perusal of it during his leisure. He kicked it unceremoniously out of his way the first time he encountered it; and when Reginald saw it next it was in a mangled condition under the stairs in the suspicious company of the servant girl's cinder-shovel.

On the second morning, when he arrived at his work, a letter lay on his case with the Liverpool postmark, addressed R. Cruden, Esq., "Rocket" Office, London. In his excitement and haste to learn its contents it never occurred to him to notice the unexpected compliment conveyed in the word "Esquire;" and he might have remained for ever in blissful ignorance of the fact, had not his left-hand neighbour, the satirical Mr. Barber, considered the occasion a good one for a few flashes of wit.

"Ullo, Esquire, 'ow are you, Esquire? There is somebody knows you, then. Liverpool, too! That's where all the chaps who rob the till go to. R. Cruden, Esquire—my eye! What's the use of putting any more than 'London' on the envelope—such a well-known character as you. Stuck-up idiot!"

To this address Reginald attended sufficiently to discover that it was not worth listening to; after which he did not even hear the concluding passages of his neighbour's declamation, being absorbed in far more interesting inquiries. He tore the envelope open and hurriedly read—

"Sir,—Your favour is to hand, and in reply we beg to say we shall be glad to arrange an interview. One of our directors will be in town on Monday next, and can see you between one and two o'clock at Weaver's Hotel. Be good enough to treat this and all further communications as strictly confidential.—We are, Sir, yours faithfully,

"THE SELECT AGENCY CORPORATION.

"P.S.—Ask at Weaver's Hotel for Mr. Medlock.

"Liverpool."

The welcome contents of this short note fairly staggered him. If the tone of the advertisement had been encouraging, that of this letter was positively convincing. It was concise, business-like, grammatical, and courteous. Since his trouble Reginald had never been addressed by any one in the terms of respect conveyed in this communication. Furthermore, the appointment being between one and two—the dinner-hour—he would be able to keep it without difficulty or observation, particularly as Weaver's Hotel was not a stone's-throw from the "Rocket" office. Then again, the fact of his letter being from a "corporation" gratified and encouraged him. A Select Agency Corporation was not the sort of company to do things meanly or incon-

siderately. They were doubtless a select body of men themselves, and they required the services of select servants; and it was perfectly reasonable that in an affair like this, which *might* lead to nothing, strict mutual confidence should be observed. Supposing in the end he should see reason to decline to connect himself with the Corporation (Reginald liked to think this possible, though he felt sure it was not probable), why, if he had said much about it previously, it *might* be to the prejudice of the Corporation! Finally, he thought the name "Medlock" agreeable, and was generally highly gratified with the letter, and wished devoutly Monday would come round quickly.

The one drawback to his satisfaction was that he was still as far as ever from knowing in what direction his respectable and intelligent services were likely to be required. Monday came at last. When he went up on the Saturday to receive his wages he had fully expected to learn Mr. Durfy's intentions with regard to him, and was duly surprised when that gentleman actually handed him his money without a word, and with the faintest suspicion of a smile.

"He's got a nailer on you, old man, and no mistake," said Gedge, dolefully. "I'd advise you to keep your eye open for a new berth, if you get the chance; and, I say, if you can only hear of one for two!"

This last appeal went to Reginald's heart, and he inwardly resolved, if Mr. Medlock turned out to be as amiable a man as he took him for, to put in a word on Gedge's behalf as well as his own at the coming interview.

The dinner-bell that Monday tolled solemnly in Reginald's ears as he put on a clean collar and brushed his hair previously to embarking on his journey to Weaver's Hotel. What change might not have taken place in his lot before that same bell summoned him once more to work? He left the "Rocket" a needy youth of £47 10s. a year. Was he to return to it passing rich of £97 10s.?

Weaver's Hotel was a respectable quiet resort for country visitors in London, and Reginald, as he stood in its homely entrance hall, felt secretly glad that the "Corporation" selected a place like this for its London headquarters rather than one of the more showy but less respectable hotels or restaurants with which the neighbourhood abounded.

Mr. Medlock was in his room, the waiter said, and Mr. Cruden was to step up. He did step up, and was ushered into a little sitting-room, where a middle-aged gentleman stood before the fireplace reading the paper and softly humming to himself as he did so.

"Mr. Cruden, sir," said the waiter.

"Ah! Mr. Cruden, good morning. Take a seat. John, I shall be ready for lunch in about ten minutes."

Reginald, with the agitating conviction that his fate would be sealed one way or another in ten minutes, obeyed, and darted a nervous glance at his new acquaintance.

He rather liked the looks of him. He looked a comfortable, well-to-do gentleman, with rather a handsome face, and a manner by no means disheartening. Mr. Medlock in turn indulged in a careful survey of the boy as he sat shyly before him trying to look self-possessed, but not man of the world enough to conceal his anxiety or excitement.

"Let me see," said Mr. Medlock, putting his hands in his pocket and leaning against the mantelpiece, "you replied to the advertisement, didn't you?"

"Yes, sir," said Reginald.

"And what made you think you would suit us?"

"Well, sir," stammered Reginald, "you wanted respectable intelligent young men—and I thought I—that is I hoped I might answer that description."

Mr. Medlock took one hand out of his pocket and stroked his chin.

"Have you been in the printing trade long?"

"Only a few weeks, sir."

"What were you doing before that?"

Reginald flushed.

"I was at school, sir—at Wilderham."

"Wilderham? Why that's a school for gentlemen's sons."

"My father was a gentleman, sir," said the boy, proudly.

"He's dead then?" said Mr. Medlock. "That is sad. But did he leave nothing behind him?"

"He died suddenly, sir," said Reginald, speaking with an effort, "and left scarcely anything."

"Did he die in debt? You must excuse these questions, Mr. Cruden," added the gentleman, with an amiable smile; "it is necessary to ask them, or I would spare you the trouble."

"He did die in debt," said Reginald, "but we were able to pay off every penny he owed."

"And left nothing for yourself when it was done? Very honourable, my lad; it will always be a satisfaction to you."

"It is, sir," said Reginald, cheering up.

"You naturally would be glad to improve your income. How much do you get where you are?"

"Eighteen shillings a week."

Mr. Medlock whistled softly.

"Eighteen shillings; that's very little, very poor pay," said he. "I should have thought, with your education, you could have got more than that."

It pleased Reginald to have his education recognised in this delicate way.

"We had to be thankful for what we could get," said he; "there are so many fellows out of work."

"Very true, very true," said Mr. Medlock, shaking his head impressively, "we had no less than 450 replies to our advertisement."

Reginald gave a gasp. What chance had he among 450 competitors?

Mr. Medlock took a turn or two up and down the room, meditating with himself and keeping his eye all the time on the boy.

"Yes," said he, "450—a lot, isn't it? Very sad to think of it."

"Very sad," said Reginald, feeling called upon to say something.

"Now," said Mr. Medlock, coming to a halt in his walk, in front of the boy, "I suppose you guess I wouldn't have asked you to call here if I and my fellow-directors hadn't been pleased with your letter."

Reginald looked pleased and said nothing.

"And now I've seen you and heard what you've got to say, I think you're not a bad young fellow; but—"

Mr. Medlock paused, and Reginald's face changed to one of keen anxiety.

"I'm afraid, Mr. Cruden, you're not altogether the sort we want."

The boy's face fell sadly.

"I would do my best," he said, as bravely as he could, "if you'd try me. I don't know what the work is yet, but I'm ready to do anything I can."

"Humph!" said Mr. Medlock. "What we advertise for is sharp agents, to sell goods on commission among their friends. Now, do you think you could sell £500 worth of wine and cigars and that sort of thing every year among your friends? You'd need to do that to make £50 a year, you know. You understand? Could you go round to your old neighbours and crack up our goods, and book their orders and that sort of thing? I don't think you could, myself. It strikes me you are too much of a gentleman."

Reginald sat silent for a moment, with the colour coming and going in his cheeks; then he looked up and said, slowly—

"I'm afraid I could not do that, sir—I didn't know you wanted that."

So saying he took up his hat and rose to go.

Mr. Medlock watched him with a smile, if not of sympathy, at any rate of approval, and when he rose motioned him back to his seat.

"Not so fast, my man; I like your spirit, and we may hit it yet."

Reginald resumed his seat with a new interest in his anxious face.

"You wouldn't suit us as a drummer—that is," said Mr. Medlock, hastily correcting himself, "as a tout—an agent; but you might suit us in another way. We're looking out for a gentlemanly young fellow for secretary—to superintend the concern for the directors, and be the medium of communication between them and the agents. We want an educated young man and one we can depend upon. As to the work, that's picked up in a week easily. Now, suppose—suppose when I go back to Liverpool I were to recommend you for a post like that, what should you say?"

Reginald was almost too overwhelmed for words; he could only stammer—

"Oh, sir, how kind of you!"

"The directors would appoint any one I recommended," continued Mr. Medlock, looking down with satisfaction on the boy's eagerness; "you're young, of course, but you seem to be honest, that's the great thing."

"I think I can promise that," said Reginald, proudly.

"The salary would begin at £150 a year, but we should improve it if you turned out well. And you would, of course, occupy the Company's house at Liverpool. We should not ask for a premium in your case, but you would have to put £50 into the shares of the Corporation to qualify you, and of course you would get interest on that. Now," said he, as Reginald began to speak, "don't be in a hurry. Take your time and think it well over. If you say 'yes' you may consider the thing settled, and if you say 'no'—well, we shall be able to find some one else. Ah, here comes lunch—stop and have some with me—bring another plate, waiter."

Reginald felt too bewildered to know what to think or say. He a secretary of a company with £150 a year! It was nearly intoxicating. And for the post spontaneously offered to him in the almost flattering way it had been—this was more gratifying still. In his wildest dreams just now he never pictured himself sitting down as secretary to the

Select Agency Corporation to lunch with one of its leading directors!

Mr. Medlock said no more about business, but made himself generally agreeable, asking Reginald about his father and the old days, inquiring as to his mother and brother, and all about his friends and acquaintances in London.

Reginald felt he could talk freely to this friend, and he did so. He confided to him all about Mr. Durfy's tyranny, about his brother's work at the "Rocket," and even went so far as to drop out a hint in young Gedge's favour. He told him all about Wilderham and his school-fellows there, about the books he liked, about the way he spent his evenings, about Dull Street—in fact he felt as if he had known Mr. Medlock for years and could talk to him accordingly.

"I declare," said that gentleman, pulling out his watch after this pleasant talk had been going on a long time, "it's five minutes past two. I'm afraid you'll be late."

Reginald started up.

"So I shall, I'd no idea it was so late. I'm afraid I had better go, sir."

"Well, write me a letter to Liverpool to-morrow, or Wednesday at the latest, as we must fill up the place soon. Think it well over. Good-bye, my man. I hope I shall see you again before long. By the way, of course you won't talk about all this out of doors."

"Oh, no," said Reginald, "I haven't even mentioned it yet at home."

Mr. Medlock laughed.

"Well, if you come to Liverpool you'll have to tell them something about it. See, here's a list of our directors, your mother may recognise some of the names. But beyond your mother and brother don't talk about it yet, as the Corporation is only just starting."

Reginald heartily concurred in this caution, and promised to act on it, and then after a friendly farewell hastened back to the "Rocket" office. The clock pointed nearly to a quarter past two when he entered. He was not the sort of fellow to slink in when no one was looking. In fact he had such a detestation of that sort of thing that he went to the other extreme and marched ostentatiously past Mr. Durfy's table as though to challenge his observation.

If that was his intention he was not disappointed.

"Oh," said the overseer, with a return of the old sneer which had been dormant ever since the night Reginald had knocked him down. "You *have* come, have you? And you know the hour, do you?"

"Yes, it's a quarter past two," said Reginald.

"Is it?" sneered Mr. Durfy, in his most offensive way.

"Yes, it is," replied the boy, hotly.

What did he care for Durfy now? To-morrow in all probability he would have the satisfaction of walking up to that table and saying, "Mr. Durfy, I leave here on Saturday," meanwhile he was not disposed to stand any of his insolence.

But he hardly expected what was coming next.

"Very well, then you can just put your hat on your head and go back the way you came, sir."

"What do you mean?" said Reginald, in startled tones.

"Mean? what I say," shouted Durfy. "You're dismissed, kicked out, and the sooner you go the better."

So this was the dignified leave-taking to which he had secretly looked forward. Kicked out! and kicked out by Durfy! Reginald's toes tingled at the very thought.

"You've no right to dismiss me for being a few minutes late," said he.

It was Durfy's turn now to be dignified. He went on writing, and did his best to affect oblivion of his enemy's presence.

Reginald, too indignant to know the folly of such an outburst, broke out,

"I shall not take my dismissal from you. I shall stay here as long as I choose, and when I go I'll go of my own accord, you cad, you—"

Mr. Durfy still went on writing with a cheerful smile on his countenance.

"Do you hear?" said Reginald, almost shouting the words. "I'm not going to please you. I shall go to please myself. I give *you* notice, and thank Heaven I've done with you."

Durfy looked up with a laugh.

"Go and make that noise outside," he said. "We can do without you here. Gedge, my man, put those cases beside you back into the rack, and go and tell the porter he's wanted."

The mention of Gedge's name cowed Reginald in an instant, and in the sudden revulsion of feeling which ensued he was glad enough to escape from the room before fairly breaking down under a crushing sense of injury, mortification, and helplessness. Gedge was at the door as he went out.

"Oh, Cruden," he whispered, "what will become of me now! Wait for me outside at seven o'clock; please do."

That afternoon Reginald paced the streets more like a hunted beast than a human being. All the bad side of his nature—his pride, his conceit, his selfishness—was stirred within him under a bitter sense of shame and indignity. He forgot how much his own intractable temper and stupid self-importance had contributed to his fall, and could think of nothing but Durfy's triumph and the evil fate which at the very moment when he was able to snap his fingers in the tyrant's face had driven him forth in disgrace with the tyrant's fingers snapped in his face. He had not spirit or resolution enough to wait to see Gedge or any one that evening, but slunk away hating the sight of every body and wishing only he could lose himself and forget that such a wretch as Reginald Cruden existed.

Ah! Reginald. It's a long race to escape from oneself. Men have tried it before now with better reason than you, and failed. Wait till you have something worse to run from, my honest, foolish friend. Face round like a man, and stand up to your pursuer. You have hit out straight from the shoulder before to-day. Do it again now. One smart round will finish the business, for this false Reginald is a poor creature after all, and you can knock him out of time and over the ropes with one hand if you like. Try it, and save your running powers for an uglier foeman some other day!

Reginald did fight it out with himself as he walked mile after mile that afternoon through the London streets, and by the time he reached home in the evening he was himself again.

He met his mother's tears and Horace's dismal looks with a smile of triumph.

"So you've heard all about it, have you?" said he.

"Oh, Reginald," said his mother, in deep distress, "how grieved I am for you."

"You needn't be, mother," said Reginald, "for I've got another situation far better and worth three times as much."

And then he told them, as far as he felt justified in doing so, of the advertisement and what it had led to, finishing up with a glowing description of Mr. Medlock, whom he only regretted he had not had the courage to ask up to tea that very evening.

But there was a cloud on the bright horizon which his mother and Horace was quicker to observe than he.

"But, Reg," said the latter, "surely it means you'd have to go to Liverpool?"

"Yes; I'm afraid it does. That's the one drawback."

"But surely you won't accept it, then?" said the younger brother.

Reginald looked up. Horace's tone, if not imperious, had not been sympathetic, and it jarred on him in the fulness of his projects to encounter an obstacle.

"Why not?" he replied. "It's all very well for you, in your snug berth, but I must get a living, mustn't I?"

"I should have thought something might turn up in London," persisted Horace.

"Things don't turn up as we want them," said Reginald, tartly. "Look here, Horace, you surely don't suppose I prefer to go to Liverpool to staying here?"

"Of course not," said Horace, beginning to whistle softly to himself. It was a bad omen, and Mrs. Cruden knew it.

"Come," said she, cheerily, "we must make the best of it. These names, Reg, in the list of directors Mr. Medlock gave you, seem all very respectable."

"Do you know any of them?" asked Reginald. "Mr. Medlock thought you might."

"I know one or two by name," replied she. "There's the Bishop of S——, I see, and Major Wakeman, who I suppose is the officer who has been doing so well in India. There's a Member of Parliament,

too, I see. It seems a good set of directors."

"Of course they aren't likely all to turn up at board meetings," said Reginald, with an explanatory air.

"I don't see myself what business a bishop has with a Select Agency Corporation," said Horace, determined not to see matters in a favourable light.

"My dear fellow," said Reginald, trying hard to keep his temper, "I can't help whether you see it or not. By the way, mother, about the £50 to invest. I think Mr. Richmond—"

Mrs. Cruden started.

"This exciting news," said she, "drove it out of my head for the moment. Boys, I am very sorry to say I had a note to-day stating that Mr. Richmond was taken ill while in France, and is dead. He was one of our few old friends, and it is a very sad blow."

She was right. The Crudens never stood in greater need of a wise friend than they did now.

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER IX.—IN TOWARDS THE WEST LAND—A STRANGE SAIL.

"I HEAR," said Lieutenant Mildmay to Colin one day, "that our good captain is still ailing."

"Yes, sir," replied Colin, "he has caught cold, I believe, or something of the kind."

"Call it by the right name, boy; put it in French if you like—*mal de mer*."

"But it seems so strange to me, sir,

"A strange sail."

"Then came the choir chanting the solemn litany."—See page 568.

that so old a man as Captain Blunderbore, and so old a sailor—"

"Stay, Colin. You must take care how you use the word 'old,' except as a term of endearment."

Colin laughed pleasantly. "Indeed, if I may speak plainly," he said, "there is nothing particularly endearing about Captain Blunderbore; at all events he hasn't evinced any very loveable disposition as yet. But, sir, he must be over fifty."

"Not quite, perhaps, and he hasn't roughed it in the service either, as I and your dear old uncle have. That accounts for the *mal de mer*, Colin."

"And why, sir," asked Colin, "hasn't he roughed it?"

"Too many friends at home, Colin; too many friends in high places; too many molly-coddles to give him the best ships, that never go twenty miles out of sight of land—ships with well-found messes, large cabins, and feather beds."

"Well, a life in ships like these," said Colin, "must be merely playing at being sailors."

"Ah! yes, lad, true, and that is one thing your uncle wished you to avoid. 'Colin must rough it, Mildmay,' he writes, in one of his pithy letters. 'There is the stuff in him to make a good officer if it be only properly worked.' But sit down, boy, and do a bit of work. You can bring your friend Quentin to my cabin also any time I am not here."

"That is so very kind of you," replied Colin; "but, dear Mr. Mildmay, this

doesn't mean roughing it, and I think my uncle would just be as well pleased if I were to do my work on top of my sea-chest, or in my own mess-place."

"True, he might, but I don't think I'll spoil you for all that. Ha!" he continued, "you have no idea what a tartar I am in the way of discipline. Duty is a most sacred thing, Colin, and if ever I found you fail in it I would bring you up sharp with a round turn, as the sailors say. Now, what are you going to do?"

"Well, sir, I have copied one of these letters. Now I am going to continue my letters home."

"Continue them? Explain."

"I write a bit about every second or third day to my father and mother and brother. And also one to the old dominie, and one to our old servant Raoul."

Lieutenant Mildmay's eyes sparkled. He looked admiringly at Colin.

"I'm glad you don't forget home," he said. "And tell me, will your old dominie, Clayton I think you call him, be pleased to get your letter?"

"Oh! delighted; he will carry it in his pocket till it is all frayed at the folds, and read it to everybody he can get to listen. He will read it to the scholars too, and a great many are still there that know me."

"Good," said Mildmay. "What a delightful thing it is to have a home, and to be loved! Now go and write. Hulloo, though, what is that!"

"I'll run and see, sir."

It was a shout on deck. A vessel had

been sighted, and Colin came back to Mildmay's cabin and reported the circumstance.

Now there is nothing very wonderful in sighting a ship at sea. But in this case there was some little interest attached to the affair from the fact that the *Theodora* was out of the usual track of vessels. She had been steering in pretty closely towards the western shores of Africa. For rumours had reached the Admiralty at home that the slave trade, so well kept down in the Indian Ocean, had broken out here. The Portuguese are not above running a profitable cargo when they have a chance, nor are the Spaniards either.

More sail was clapped on the *Theodora*, and she was kept away a few points so as to steer in the direction of the strange sail, which, curious enough, seemed wishful to sheer off in quite a suspicious way, and give the war ship a wide berth.

There was a good deal of bustle on deck, and some small show of excitement when Colin went up again.

Benbow and the doctor were walking up and down the quarter-deck; even D'Austin had come up, and had his pale face and aristocratic nose over the bow in the direction of the chase, for chase she now appeared to be.

Captain Blunderbore sent for his second lieutenant.

"Good evening, Captain Blunderbore," said that gentleman, coming down off the bridge and tripping up to his commander.

"Ah! good evening," replied the captain, returning the salute; "so we're in chase, are we?"

"Well, sir," began Gayly, "when anything runs away I think it is our duty to—er—"

"To run after it, Mr. Gayly; most certainly. And what do you make of her?"

"Well, sir, it is getting dark now, and we won't see much more of her, I fear. At present she is a bit of a mystery. You see, sir, she is running clean away from us, or trying to; now what does she want to run away for, I ask, if she has, morally speaking, a clean bill of health?"

"True, Mr. Gayly, true sir."

"So I've given the orders to get up steam, and we'll try if we can't overhaul her."

"Quite right. But she'll be sure to extinguish her lights when it gets very dark, won't she?"

"I fear so, sir. I fear so."

And as he spoke little Gayly stood before the captain with his left forefinger pressed against the left corner of his mouth, and his left elbow supported by his right hand in a very thoughtful attitude indeed.

A smart wee man was Lieutenant Gayly, I can assure you. About five and twenty, fair-haired, heavy in brows when

cogitating, fierce in eye, square-shouldered, a waist like a hornet's—they did say that Gayly wore stays—white immaculate gloves, spotless linen, and patent-leather boots upon feet not much bigger than a Chinese lady's.

I don't say that Gayly was not smart and clever, mind you, and a good strict officer and all that, but he had too much peacock pride about him for a genuine sailor.

"Do everything for the best, Mr. Gayly," said the captain. "Indeed, I know you will. I'm going below now. Keep me posted."

"That I will," replied Gayly, smartly.

Captain Blunderbore made his way to the companion. He met Quentin Steele and Colin coming along the quarter-deck, on the lee side, and stopped to speak to them.

"I hope you like your ship, young gentlemen, and are doing your duty," he said in a half stern, half fatherly tone of voice.

"Oh! she is a splendid craft," said Quentin, with enthusiasm.

"First-class," said Colin.

"Well, lads," replied the captain, pointing away ahead to the light now glimmering across the water from the strange craft. "We're going to get some prize-money for you. Ha! ha! Lucky

young rascals. I wish I was young again."

It was a merry little party that evening in the captain's cabin. Benbow was in fine form, and told many of his most miraculous yarns.

Dr. McGee, in his own way, was not a whit behind him.

Captain Blunderbore laughed till his eyes ran water, and he had to blow his nose and laugh again; but Benbow never laughed a bit, even when telling the most preposterous stories.

Meanwhile steam was got up; but about ten o'clock, when Lieutenant Gayly came in to make a report, he had a rather long face.

"Can't get near her, sir," he said.

"She still burns her lights?"

"Yes, sir."

"Strange!" said the captain. "Well, well, just keep on. If you do get near enough, put a shot through her rigging."

"Ay, ay, sir."

It was a lovely night. Though no moon was shining then, the stars were so bright that every mast and sheet and stay was distinctly visible, and the broad wake that the Theodora left behind, whitened by the churning screw, and the racing waves sparkling in the stars' light, and far away to windward the strange mysterious sail.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy Earl," etc.

CHAPTER XXI.—RUSSIAN OFFICIALS.

WE have stated that Frau von Steinfeldt and Ivan preferred the winter for travelling, but this must not be taken as a rule of universal application. Many Russians prefer to perform their long journeys in May, when the disagreeable part of the year, the time of the great thaw, is over, and the sun has not yet commenced to burn everybody and everything with its pitiless rays. But when there is a good beaten track over the snow, and the road is hard and firm, there is no question as to which is the best time to travel in Russia.

On the present occasion a first-class carriage for two was taken for the travellers, a carriage which could readily be converted into wonderful bedrooms, by raising seats, depressing backs, and otherwise acting upon the extraordinary machinery of the luxuriously-stuffed sofas lining the carriage. Each carriage, or rather compartment, opened upon the common corridor, in which were windows for the admission of light, and, like all windows in Russia, for the exclusion of cold. There was a regular room, or compartment, with a lavatory for ladies at one end, and at the other a similar room for men. This corridor was warmed by a stove at each end, which supplied heat enough for all the hot-air pipes winding round the carriages, keeping them warm despite the cruel cold without, the extent of which is quite unknown in England. There was, in the carriage in which Ivan travelled, also a room like a saloon, to which people could retire while the con-

version of the carriage in which they rode was being effected.

It is true that on Russian lines the speed is nothing compared with that attained in England, but the want of rapidity in travelling is well compensated for by increase of safety and of comfort. People travel such enormous distances in Russia that a few hours, or a day or two even, more or less, cannot make much difference in their calculations; whereas in so small a country as England it is easy to count the very minutes which we have at our disposal for travelling purposes.

At the time agreed on the two adventurers, with their luggage, were seen "on board the train" by Smirnoff, Tenterton and Madame Kakaroff. Von Steinfeldt had arranged to accompany them as far as Nijni Novgorod. Very hearty farewells were exchanged, and the journey commenced.

By an arrangement with the guard, a bed was made up for Ivan in the saloon during this journey. Nothing of special interest in the progress of our story occurred during this portion of the trip. Nijni was reached, and its peculiar fair-like arrangement of streets was not so striking as usual on account of the snow, which lay like a dazzling tablecloth spread over the whole town. It was not a time to see the fair, which does not begin till the summer, and our travellers had not started on a sight-seeing expedition, nor did the town under snow possess any great attractions for them. The projecting spires glittering in the

sun, the Russian domes and crosses, were familiar objects to them; besides, their minds were so full of other and sadder thoughts that such external matters had little interest for them just now.

They alighted at the terminus, and in the spacious hotel attached to it they found ample accommodation and not many visitors to distract the attention of the Tartar waiters, who in their white linen jackets and trousers did not look as if they believed it to be winter. Ivan said they were snow men animated for the occasion, but who would melt away in the thaw.

There was a touching leave-taking between husband and wife as the former took the return train to Moscow. After his departure neither Ivan nor Madame Steinfeldt seemed to care about Nijni and its oddities. They were impatient to reach Kazan, to which the railway is not yet complete. They therefore hired two sledges, in one of which they drove with some smaller articles of dress and certain requisites which they very zealously guarded. In the second sledge they deposited their heavier luggage, which was guarded by a Russian ex-soldier, engaged on the recommendation of the hotel-keeper at Nijni.

The air was piercingly cold; so cold that no English lady would have cared to face it, but the warm furs provided for the travellers bid defiance to the climate. There was no wind. The air was as calm and as still as death. The yamschik had to drive most carefully

not to miss the beaten track which gave solidity to the mass of snow over which they travelled, and which itself had been hardened by the passage of many sledges. The road was indicated by poles set in the ground, originally spars, but now only projecting a few feet from the snow.

It must be borne in mind that on each side of this beaten track the snow was loose and feathery, so that if the driver missed his way there was no chance for the traveller but certain death, for the depth of the snow was, as indicated by the poles, considerable, and if the horses had fallen over they would have plunged deeper and deeper into the sea of snow, and have perished, involving sledge and passengers in ruin. In view of the possibility of such an accident, Herr von Steinfeldt had recommended the engagement of another sledge, so that help should be at hand in the worst case. Besides which the authorities at Nijni had ordered relays of horses at the stations along the route.

The nights of two days were passed in weird villages forming the stations for the horses and dignified by the name of towns. But there was no talk of bed! The grimy little wooden hovel serving as the best "hotel" presented no attractions to sleepers in that region, sofas in the common room were used by the travellers covered up in their own furs. A samovar they found. As no peasant is without that useful article, and as they were provided with tea, sugar, and all sorts of preserved meats stowed away in the second sledge, they were well off for food. They had plenty of sugar themselves, and so were greatly amused at the sight of a large lump of this important aid to tea-drinking hanging in the centre of the room by a long string, so that the frequenters of the "hotel" could drink their tea from the glass and take a small "bite" at the sugar, retaining the morsel so secured in their mouths to sweeten their tea in its passage. Even in western Russia, in Moscow itself, there are many persons who, instead of dissolving their sugar in their tea, bite off such small portions as they may require and drink the tea unsweetened, save by the amount of sugar it may wash off from the lump in the mouth.

At length the strange "Tartar city" of Kazan was reached without any accident. The two nights' want of rest and the three days of incessant travelling had somewhat exhausted our friends, and they were glad enough to find themselves in a comfortable hotel. The Oriental appearance of much that they saw struck them as very odd. The women with their veils coming from the Tartar town, the colour of the men of the same district, whose tawny complexion would vie with the Hindoos, seemed so strange. The Tartars have their own town, but they do not entirely keep in it, and we meet them all over the streets of the Christian city, though Christians seldom go into the Tartar portion, with the exception of the missionaries, who are very active in their endeavours to convert their Mohammedan neighbours. They have a regular school for Tartar children rescued from Mohammedanism and trained to become missionaries amongst their countrymen. As in Moscow and in other Russian towns, there is a Kremlin at Kazan also surrounded by walls and containing numberless holy buildings.

After a good rest at this "second Moscow," a long and tedious journey of five days brought our travellers to Perm, whence the new railway was to carry them to the Ural Mountains, and so into Asia proper. Ivan said it was "jolly to know geography," and he "thought it fun to drive out of Europe into Asia without any change of carriage. The luggage had been transhipped from the big sledge to the train, and the comfort of railway travelling soon taught our two friends to forget the discomfort to which they had been subject.

Fairly in Asia, no trouble or indeed any noteworthy event occurred, and our friends continued on their way in great comfort until they arrived at Ekaterineburg, where already preparations had been made to receive them, and here the grand scheme laid by Ivan came into play.

The reader may remember that the boy was most anxious to obtain possession of a suit of clothes belonging to the daughter of the officer of police into whose hands he fell on the occasion of his second loss, and to induce her to let him have her passport. His idea had always been to pass the barriers as a girl, openly and without shrinking, offering his passport as Malutin's daughter. Once across, he meant to have changed his dress to that of a boy, and to have repassed the barrier in his own person unperceived—and, indeed, to have waited until a good opportunity of doing so should offer. Now the fact of travelling as the son of the Frau von Steinfeldt rendered part of the trick easier of accomplishment. She had been provided with three passports—one for herself, another for her daughter, and another for her son. With her own hands she had prepared a well-fitting dress, with hat, cloak, and baschlik (a kind of hood worn to keep the head warm in winter) all complete for Ivan to masquerade in as Fräulein von Steinfeldt, and the passports were arranged for Tobolsk and back, thus providing for the return of Frau von Steinfeldt with two of her children, while Ivan trusted to his past experience to enable him to pass for a boy and a girl in getting into the "difficult" ground of Ekaterineburg. Their letters procured them a warm reception from a rich Siberian merchant named Zoffolovski, and here operations first commenced.

Their sledge drove up to the door, and was soon surrounded by servants, who desired to help in getting out the smaller parcels in the carriage. It was a hooded sledge, and Ivan had been able to slip on a dress skirt, a schuba, and a baschlik or hood, so as to be, to all intents and purposes, a young lady. The two were shown up a short flight of about a dozen wooden steps to a large hall from which doors opened on either hand. A benevolent old gentleman apologised for the non-appearance of his wife (who was ill in bed) to welcome the new-comers.

The next morning they were late in rising, and at noon they were to leave and pass the barriers into what may be called the police country, and here some delicate management was requisite.

Away drove Madame Steinfeldt with Ivan as a girl. The day was bright, though intensely cold; the snow lay thick upon the ground, and they trotted off, the merry bells jingling from the "duga" or bow over the centre horse of

the three that drove the sledge. When they arrived at the barrier they found several soldiers and an officer inspecting the sledge with their luggage, which of course was already at the bar. Madame Steinfeldt stepped out and presented her passport, together with those of Ivan and Olga.

At the sight of the name the officer ordered the barrier to be opened very wide, the guard to turn out and salute. Then he regarded the three passports and only two persons, and asked whether her son were coming on or not. He would make a note if she wished, and let him through afterwards, or do whatever she liked to avoid delay. This had been provided for by Frau von Steinfeldt, who said, "Ivan should have been in the sledge with the baggage. If you please, I will drive after the luggage-sledge, which is not far off, because my daughter wishes to see whether a favourite trunk is there or not. Of course, she can remain and go on with the luggage while I drive back for Ivan."

"Whatever you please. I have orders to offer you every possible aid in passing the barrier. It is only my duty to you to check the number of travellers by the number of passports. Pray do exactly as you like otherwise."

Thanking the officer for his courteous attention, she drove rapidly after the other sledge, which she soon overtook. Within her sledge were Ivan's schuba and boy's baschlik, and she contrived to put every article of his girlish attire except the large external cloak and the baschlik into the luggage-sledge. This done, Ivan returned to her sledge and lay down at the bottom, well covered by furs and the apron or cloth.

On coming to the barrier the officer saluted as before, and Frau von Steinfeldt exclaimed, brightly, "All right, I shall soon return with my son."

Away they rattled, and Ivan emerged from under the apron of the sledge, and put on his boy's schuba and baschlik. She then returned with him in his boyish character and passed the barrier triumphantly, the officer saluting as before; and the yamschik, satisfied that the lady had found what she thought she had forgotten, took no note of Ivan.

At the next station Madame Steinfeldt requested that the drivers might be changed as well as the horses, for now a serious journey lay before her. She had to make for Tiumen, a distance of two hundred miles from Ekaterineburg. Wolves were reported "out," and she had no male protector save Ivan, who, however, astonished her by showing a wonderful revolver which he had bought at the "English Magazine" at Moscow. It was a large one with six chambers, and Ivan showed what a store of ammunition he had provided.

"This is something like travelling, you know!" he said. "But before we go on, I wonder if we could not engage some one to ride with us and help us take charge of the wolves?"

"A very good idea, Ivan. I must see the head-man of this village—which, indeed, seems rather an important place. There are several very respectable houses in it, and the cutting and setting of precious stones are, I am told, much practised here. I think, as we must wait to know about the guard, we might stop and look at the workshops and have some lunch."

This latter was a proposal that could never come amiss to Ivan. So they were driven to a long, low log hut, which was the "hotel" of the place; but, on receiving an unlimited order for lunch, the table was speedily spread, and a wonderful soup made its appearance. There were three kinds of bread on the table—the coarse black bread of the country, ordinary white bread, and the little dinner-rolls called "roses," for which Russia is justly famed. After the soup there was some magnificent fish, with somewhat of the flavour and all the consistency of boiled veal; then came beef and a salad, then partridges, then a capercailzie, and lastly a pudding like a Madeira cake, with sauce of a most delicious flavour. Red and white wines of Russian growth were supplied, and the repast terminated with coffee. When Madame Steinfeldt asked for the bill, judge her astonishment when the demand amounted to one rouble each (a rouble is just two shillings)!

After this lunch they were waited on by the head-man of the place, who had already heard that "Excellencies" were travelling, to whom every respect must be shown. He came in a green dress-coat, with the eagle button and a gilt collar of office. He was attended by his secretary, and when they entered the long room, unfurnished save by a long deal table, two deal chairs, some deal forms, the big, big stove in the centre, and the holy saint in the corner, they paused, threw off their schubas, and bowed. Oh, how they bowed!

"I am much obliged to you, gentlemen, for your politeness in coming to me," said Frau von Steinfeldt. "I took the liberty of asking you to do so, as I want your kind assistance and advice. We are travelling to Tiumen, and hear that the wolves are out. Can you assist me by inducing some gendarmes or mounted Cossacks to accompany us so far?"

"Most certainly. You have but to command. We have not many guards here, but we can spare a corporal with six men, if you please."

"That is charming; and now tell me, if you please, how much I must pay for this generous aid."

"What your Excellency pleases to give the men they will be pleased to accept. We have orders to show you every attention, and are only too glad to have the opportunity of doing so, if you will only speak well of us to the Emperor when you see him next. He will ask you if you have seen me, Peter Petrovitch Lomonoff, and it would be a pleasant feeling to know that the Emperor was personally satisfied with me."

With many bows and almost entire prostration of the person on the floor of the queer chamber to which we have introduced our readers (and to which the "worst inn's worst room" in England would have been palatial by contrast), the magnates of the town withdrew to seek the military aid required. Everything is military in Russia, and in Siberia, where so much civic soldiery is required, all men, excepting those in the penal settlement, who belong to the guarded and watched classes, have some touch of soldiery. Some police-soldiers were in the town at the time of our hero's visit, and to them our friend the mayor repaired with all the dignity of authority.

"You are all of you good servants to our Imperial Master the Emperor of All the Russias, the Head of the Church on Earth, and the Commander of all our Armies?"

"Hurrah! long live the Czar!" cried the officer, a young lieutenant, and the cry was re-echoed by the men, though it did not sound quite so hearty.

"A near relation of his Imperial Grace the Emperor has just arrived, but without escort. You will be chosen, or, at least, six of you will be chosen, to escort her to Tiumen, where she must be safely deposited with the mayor of that place."

Presently one of the soldiers who had gone out returned with his sergeant, who merits a special introduction to the reader. Stefan Michaeloff Gabrielloff was a tall, gaunt man, with a fiery red face like the sun seen through a fog. The hair of his head had been worn away by the pressure of his helmet, his whiskers were shaven off, and so was his beard, leaving his face as smooth as a Dutch cheese. But it seemed as though all the hair wanting in those places had been collected to form a pair of mustaches so big, so long, so thick, so bristling as to give the wearer enough fierceness for the whole troop, who, to do them justice, were no milksops either.

He was a man of about fifty or fifty-two, very muscular though gaunt-looking. His nose showed tokens of intimate acquaintance with the customs of any army rather than the "Blue Ribbon." But the feature about the man was certainly the mustache. This was in splendid order, well waxed, curled from the centre downwards, so as to overshadow the mouth, which seemed in consequence to be within some fortification of an impregnable nature. The two ends were waxed as though in defence of the face—and indeed of the whole man—nay, when riding at the head of a sergeant's guard, they looked as though they were in some way doing duty for the whole company.

The bearing of this man was very soldierlike. He had fought under the white general at Plevna, "Don't you know?" and his eye would glisten and his mustache bristle as he said it, so that he looked, not as the Americans say, as though he had eaten a pint of fish-hooks, but as though he were all through made of bayonets.

This worthy entered the room, his face red from use of the poison of Russia—vodka—and his form a little stiffer (if possible) than usual. He entered the room hurriedly, clothed in his long grey overcoat, with the white sword-belt and white straps for the sword. He wore an undress cap of green cloth with red pipings and the Russian cockade in front. Nobody could have doubted who saw him that the Russians had been successful. He entered the room hurriedly, but seeing the officer he drew himself up into a martial attitude, and brought his hand to the salute, exclaiming,

"What are your orders?"

The officer returned the salute carelessly, saying, "You must ask these gentlemen. This is the mayor and that is his secretary."

And so it was arranged that this sergeant should take charge of the travellers.

The sergeant was now introduced by the mayor to Frau von Steinfeldt, who won the grim soldier's heart at once by presenting her hand, which he kissed re-

verentially, and then ventured to suggest that another sledge should be added for stores and provisions, poles and canvas for tents in case of snowstorms overtaking them, in which case they must make a stern fight of it.

The readiness of this warrior charmed our hero. The lady gave him *carte-blanche* in the purchase of whatever he thought necessary, and found to her surprise that forty roubles (about £4 in English money) covered the whole. When everything was arranged and the men in marching order, she was touched by a trait of true Russian feeling.

Through the snow came a priest in full canonicals with the gorgeous dress of the Greek Church; the deacon in his white robe followed with a large cross; then came the choir chanting the solemn Litany, the words of which sound so weird from Russian lips, gaining immensely in musical effect! "*Gospodi po mie letiye!*" [Lord have mercy upon us] sounded grandly in that strange place. And the scene was a subject for a painter! The queer, long, low log-cabin of an hotel; the soldiers firm on horseback with their grey coats over their fur schubas, with their baschkliks of the same brownish grey as their coats, the white cross-belts forming a pleasing relief; the queer-looking old-fashioned sledge, like a hooded phaeton, dismounted from its wheels to be dragged through the snow; then the group of priests and the choristers blessing the party!

And now all was ready; the three sledges, the peasant sledge with poles and canvas, the six troopers and sergeant Gabrielloff, who had all his party in perfect order, two in advance, one on one side of Frau von Steinfeldt's sledge and himself on the other, one in charge of the provision sledge, and two to bring up the rear. Then he gave the word, "Forwards—March!" Away they started, leaving the young lieutenant lamenting that he had allowed the sergeant to take the place which he might have occupied just as well and so profitably to himself. The soldiers uttered another hurrah! which was echoed by many of their comrades who now came upon the scene. The priest stood with outstretched hands and upturned eyes imploring the Divine blessing on the party. The mayor and several functionaries of that small town laid in a store of neuralgic rheumatism for the rest of their days, by standing bare-headed in the biting cold, bowing to the departing "princess." The peasant women, in their curious brown, yellow, or black schubas, their red handkerchiefs and yellow shawls, bound over and about their heads, looked like a party of North American Indians, while the mujiks standing in a separate group looked much about the same.

"Ah-h-h!" (almost three syllables) exclaimed a fine old Russian peasant woman to a Samoyede girl who had come into town with a party of her country-people bringing supplies of game. "Ah-h-h! there goes a real lady! That's a Russian, and that is what you get to see by coming to us."

(To be continued.)

ADVENTURES IN NEW GUINEA.

Life in New Guinea.—The Mancatcher at work.

THE manners and customs of New Guinea are rather startling.

"It was resting-day at a village, far away from the coast, and, spreading my chart out on the middle of the floor in the small native house in which we were camping, several sitting round, I was tracing our journey done and the probable one to do, when strange drops were falling around, a few on the chart. They came from a bulky parcel overhead. Jumping up quickly, I discovered that they were grandmother's remains being dried. Our chart was placed on the fire, and the owner was called lustily, who hurriedly entered and walked away with the parcel."

This horrible way of treating the dead is curious enough, but it is by no means the most curious thing in the new book on New Guinea just issued by the Religious Tract Society. The earlier and chief part of that volume is from the pen of the Rev. James

Chalmers, whose enthusiastic labours among the heathen Papuans have been well known for years, and who is recognised as the principal authority on all that concerns the largest island of the globe. His facts, which are far more interesting than fiction, can therefore be relied on, and, as we have hinted above, it is indeed a strange people with whom we have to deal.

On the subject of dress, for instance—to say little of that modern innovator who helped to get the teacher's goods ashore and who had a pair of trousers minus a leg, and wore the body of the trousers round his head with the leg falling gracefully down his back—we read of a people that wear nose-jewels three-quarters of an inch in diameter, and daub their faces in stripes of black, white, red, and yellow; who when in mourning paint themselves all over black and wear net collars, and when in very deep mourning get inside a "very tight kind of wickerwork

dress extending from the neck to the knees in such a way that they are not able to walk well." We read of head-dresses seven feet high, built up on a wooden frame, while "at Kabadi and Naara they have frames about two feet and a half in height and three feet broad, and from the centre a long stick ten or twelve feet long; on the frame and centre they fasten plumes until all the wood is hidden." We read of tattooed chiefs, each mark on whom means a life violently taken, and some of whom are almost covered with these savage medals of honour. And we read of tight-laced dandies, whose bodies have been tortured into dumb-bells. "It is ridiculous to see a broad band round the stomach of a dandy, the flesh above and beneath bulging out by way of revenge. The band is made of strong material, and when of sufficient length the ends are dexterously woven together on the body. However corpulent the dandy may become, this band indicates

Boevagi, Chief of Port Moresby.

Natives of South-Eastern New Guinea.

Tree Houses.

his original dimensions. There is no way of removing it except by the knife."

The only field in which these people have shown much skill and ingenuity is in the manufacture of weapons. Of these we give an illustration of the most deadly. It is

known as the mancatcher, and was invented by the natives of Huon Bay, but it is used all over the island. The peculiarity of the mancatcher is the spike in its handle, which once the loop is over the neck can hardly fail to be fatal. In canoes, too, the people are rather

ingenious, the Port Moresby natives during the south-east monsoon lashing their canoes together, sometimes up to as many as fifteen, and forming a safe and peculiar-looking raft.

The houses too are strange. In that temporarily occupied by the teachers "skulls, shells, and cocoanuts are hung all about; the skulls are those of the enemies he and his people have eaten. Inside the house, hung up on the wall, is a large collection of human bones, bones of animals and of fish." Bones are much in use for decorative purposes. "One of our guides to the village wore as an armlet the jawbone of a man from the mainland he had killed and eaten; others strutted about with human bones dangling from their hair and about their necks." Some of the houses are in the tops of trees, with ladders of long vines on each side to assist ascent. Some are like animals. "The largest houses are built to represent an alligator with open mouth; the platform in front of the house is the lower jaw, and the long shade over the platform the upper, so that standing on the platform you stand in the alligator's mouth, the house sloping to appear as a body." And in some districts the houses have a regular burglar alarm. "On the door hangs a bunch of nutshells, so that when the door is shut or opened they make a noise. Should the occupants of the house be asleep and their foes come, they would on the door being opened be awakened up. Spears and clubs are all handy."

And the domestic utensils are peculiar. "In crossing one of the spurs a native and his son brought us bananas, and water in a bamboo. It is difficult to drink out of a bamboo. Place the open end to the mouth, raise gradually, look out, here it comes—steady! Ah! too much raised; it is a deluge streaming over you and nearly choking you. Try again. Well, a little better, yet far from perfect. Choking are you? Never mind; practise, and you will soon be an expert—a native in drinking truly. The natives have been having a feast. They began with boiled bananas and finished with a large snake cooked in pots. It was cut up and divided out amongst all. Sixteen eggs were found in her, a little larger than a good-sized fowl's egg. They seemed to relish it much, and the gravy was much thought of. They say pig is nothing compared to snake. Ah, well, tastes differ."

A Forest of Pandanus-Trees.

Of the animal life Messrs. Chalmers and Gill give many graphic notes. "We saw three nests of the mound-building megapode; one of them was fifty-one feet in diameter. It is said that larger nests exist at East Cape. It seems incredible that so small a bird should build such immense tumuli as nests. In point of fact, however, no such

giving them a large, handsome appearance about the head and neck, their long flowing plumes so arranged that every feather seemed carefully combed out, and the long wires stretched well out behind, were dancing in a circle round them. It was an interesting sight. First one, then another would advance a little nearer to a hen, and she,

"His wife went to the beach at break of day. In the twilight she observed what she took to be a log of wood lying on the black sand. To her horror, the log became animated and rushed upon her, being in reality a hungry crocodile watching for prey. A smart blow on the neck from the serrated tail laid her on the sand; she was then

New Guinea Weapons.

mound was ever built by a single bird or in one season. The *Megapodius tumulus* never sits upon her eggs, but buries them deep in the mound, to be hatched by the heat of the sun and fermentation. We had two fine eggs for breakfast; being fresh, they proved to be capital eating." Or take the following concerning the world-famous birds of Paradise:—"One morning we had camped on a spur of the Owen Stanley Range, and being up early to enjoy the cool atmosphere, I saw on

coquette-like, would retire a little, pretending not to care for any advances. A shot was fired, contrary to my expressed wish; there was a strange commotion, and two of the cocks flew away, the others and the hens remained. Soon the two returned, and again the dance began and continued long, and I having strictly forbidden any more shooting, all fear was gone; and so at last a rest, and then a little nearer to the two dark-brown and certainly not pretty hens. Quarrelling

grabbed by the right thigh and carried into the sea. The *paws* with their sharp claws were used, *not the jaws* of the reptile. The poor woman had nothing in her hand to defend herself with. She, however, furiously beat its paw with her clenched fist, and so much alarmed it that it relaxed its hold for a second, and retired to a little distance, still intent upon its prey. Teinaore heard the screams of his wife at the first, and happily arrived at her side just as the reptile

Dubus at Vailala and Moapa—Koapina, Chief of Moapa.

one of a clump of trees close by six birds of Paradise, four cocks and two hens. The hens were sitting quietly on a branch, and the four cocks, dressed in their very best, their ruffs of green and yellow standing out,

ensued, and in the end all six birds flew away."

In the New Guinea rivers the crocodiles are pretty numerous, and some of the stories about them are particularly thrilling.

loosed its grip. The loud voice of the husband and the splashing of the water so alarmed the crocodile that it made off into deep water. As soon as Teinaore had deposited his wife in the care of friends he ran.

for his rifle, rammed two bullets into it, and waded into the shallow water in search of

satchel. Taking it, I wheeled quickly round, presented it to the savage, whose eyes

them! What next? A missionary dives some distance out, crawls along the bottom,

New Guinea Weapons and Ornaments.

This scaly foe. It rose just where it had previously disappeared and received both bullets

A Native of Port Moresby.

in the eye, but it was not until the following day that the body was secured. The slugs testified to its identity."

But perhaps the following is more extraordinary.

"Whilst pulling up this river Mataio assured me that it is horribly infested with crocodiles. A famous warrior, fishing here alone one day (he unwisely stood in the stream), was clutched on both sides of his body by the claws of a crocodile. The brave fellow instantaneously grasped the separate claws of either paw and forced them back with tremendous violence, dislocating them. The brute, not liking this unexpected reception, made off, but the man carried the marks to his grave."

The missionaries went with their lives in their hands. We need not enlarge on that point; one extract will suffice us.

"We were followed by the crowd, one man with a large round club walking behind me and uncomfortably near. Had I that club in my hand I should feel a little more comfortable. When on the beach we saw the canoes had left the vessel and were hurrying ashore; our boat was soon afloat, still we had some distance to go. I must have that club or I fear that club will have me. I had a large piece of hoop-iron, such as is highly prized by the natives, in my

were dazzled as with a bar of gold. With my left hand I caught the club, and before he became conscious of what was done I was heading the procession, armed as a savage, and a good deal more comfortable. We got safely away."

And as a contrast we will quote in conclusion one of the most delightful descriptions we ever remember meeting with in a book of travel.

"What is that noise? Oh, bathers, in for a good sea-day, in one of the finest bathing-places I have ever seen; swimming, diving, turning somersaults, and ducking one another; there they go. A shout! Off under the water, back again, meet, down all go again, and come up in different places, blowing hard and roaring with laughter. What a splendid beach! So white and clean, so firm, and so suitable for swimmers and non-swimmers. What nonsense and how stupid looking at them and not going in and being happy in salt water too! Old missionaries now, so must be sedate. Ah, cannot be so; with so much magnetic happy youth about, so much innocent fun, the old hearts beat young, the enthusiasm of youth is felt, and—must I relate it? Yes, out with it. We undress, and clothe ourselves in bathing costume. A great shout; the enthusiasm and excitement reaches its height; the missionaries are bathing! What! missionaries ducking them, racing with them, diving with them, swimming under water with

catches hold of a pair of heels, and over the owner goes, alas! to be nearly drowned.

A Hula Dandy.

Never mind who the owner was or who the

Echidna.

missionary was, but in years to come that bathing will be remembered.

"What next? We spread leaves, gather in classes, and sit quietly; the serious business of the day is about to begin, and to the natives the really most important. Pig, sago, rice, and bananas are soon divided, and the babel ceases, whilst our chief, Boe, asks a blessing, thanking the Giver of all good, of peace, goodwill, and friendship, who spreads a table for us, and supplies our every want; then each leader is called, and the division of food is carried off and eaten. All are satisfied and revived for new exertions in fun, but first a short service takes

place. 'I have a Father in the promised land' is sung in Motuan, a few words of encouragement are spoken, and an earnest prayer is offered to Him who loved and still loves children that He would bless these children. The prayer is offered by the first convert, a good earnest fellow, who has already done much service in the distant west; his favourite story in new places is Noah and family and the flood, and he says when he tells that story that he soon gets an attentive audience.

"And now for racing. The boys and girls all try it; beads and looking-glasses are given as prizes. What roars of laughter, as

they tumble over one another, and when others carry off the palm no bad spirit is shown. The racing was led off by a missionary and two natives, the former coming in first; a three-legged race was the climax of amusement, and caused roars of laughter. They took some time to find out that by taking one another round the neck they could steady themselves and run faster. The 'tug-of-war' was exciting, and when the rope broke the shouting was beyond description. Then came some of their native games, and nothing in them called forth condemnation."

(THE END.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

PART VII.

ANOTHER piece of advice to be given is, Never shun the capture of a fish because it seems in a position of danger to your tackle. I think it the height of cowardice in an angler to say, "Oh, it's no use trying that fish; it will only break away." My motto is, "Hook the fish" first, and let the landing of him be a subsequent consideration. It is surprising how fertile you are in expedients when a large fish is taxing your tackle at one end and you are taxing your inventive faculties for his capture at the other. And, besides, good tackle will take a great deal of straining ere it gives way, so, taking the matter in all its bearings, I am certainly of opinion that even if you lose your prey at last "it is better to have hooked and lost than never to have hooked at all."

Always fish up if you possibly can. Indeed, I would not give a snap of the finger for the pleasure of being obliged to fish down, yet this certainly sometimes happens when the wind is dead against one and very rough. If it is not over rough it is generally possible to get a line crosswise over the stream, and with this you must in such circumstances be content. Still, the obvious reason for fishing up ought never to let you forget that this is the most rational way of circumventing the fish. "What, don't you know the rational reason?" Didn't I tell you some time back that trout always lie with their heads up stream? Well then, my friend! if you stand so that they can see all there is of you and let the line down, don't you think it is just possible that Master Trout will imitate a celebrated comic character, and, winking his eye, quote "Not for Joseph"? Whereas if you are behind the trout you will find you are on a comparatively blind side, and that, though those bright expansive eyes are capable of seeing a little distance over the back of their owner, they are by no means so situated as to reveal anything going on more than a few yards off. This fact is so self-evident that I wonder there could ever have been a sane person found who would be bold enough to contradict it. Certainly, however, Mr. Cholmondeley Pennell did dispute it some years ago against Mr. Stewart, another well-known author on fishing, and in the columns of the "Field" too. Of course Mr. Stewart had the weight of natural fact on his side, though Mr. Pennell's arguments were remarkably well put, as one would expect from so experienced and brilliant a writer.

Only one exception to the up-stream-fishing rule occurs to me, and that is when the deadly Alexandra fly is resorted to. This fly I first saw some ten years ago at Denham Fishery. It consists of a largish hook (about No. 6), and the body is carefully made of broad silver tinsel, wrapped round closely. The wings may be formed of a dozen strands of brown turkey feather, and the hackles, which are very voluminous, consist of the blue fibry feathers from the peacock's neck—altogether

a deadly apparition! Although its use is forbidden rightly on many streams, it is sometimes used where the water is rough, well-wooded, and swift-running. The line is let out down-stream, and drawn up with a number of swift jerks, which, as they are at regular intervals, reveal the white silvery body amidst the darker shades of the hackle and wings. The trout doubtless takes this creature for a minnow, and in clear streams my opinion decidedly is that its use should be prohibited.

Certain climatic influences also unquestionably interfere with success in trout fishing, apart from the mechanical influence of an adverse wind. An instance occurs to me in the decided unfavourableness of a north-east wind in early summer, or the equally adverse influence of a distinct north-west. Then, again, it is ordinarily quite vain to seek really first-class sport when the temperature of the water is much below that of the air, though even this is not so bad as when the water is warmer than the atmosphere—as is shown at night by the mists rising through radiation, enveloping the stream in a chilly, ghastly fog, dangerous to the angler, and certainly inimical to the results of the rod. And these remarks lead me to urge on all young fishermen the desirability of possessing a thermometer. A decent one can be got for a shilling, and a systematic observation of the relative temperatures of the air and water respectively may be made, which I know to possess very pronounced interest to all who study piscine life, than which branch of natural history there is none more fascinating. My father, one of the best barbel and bream fishermen of the Thames, always paid attention to this simple instrument, and so also did—and, for aught I know, still does—Mr. Bailey, of Nottingham, the founder of the Nottingham style of fishing with which his name must ever continue to be indissolubly connected as long as angling literature remains.

"What then," it may be asked, "is the best weather for trout-fishing?" I unhesitatingly reply—a thermometer at about ninety degrees in the sun, a gentle south-west wind, a sky with white masses of cumulus clouds floating lazily; and for the season, give me the first week in June. My reason for this selection of season is not a peculiar one. It is then that the Mayfly makes its appearance, and, much as I enjoy the fishing with a tiny quill gnat, or olive dun, or red-spinner, yet more entirely do I love the large succulent insect that floats, borne on every breeze, even to the veritable fishes' mouths. Charles Kingsley poured out his piscatorial soul in a panegyric of unexampled eloquence over the alder-fly—a Satyr to the Hyperion Mayfly—as different in comparison as I to Hercules. The fly which, albeit it visits us in June, is termed "of May," is of all creatures beautiful, with its grey-green or yellow-green

(as the case may be) wings glistening in the sun, and like the most exquisitely wrought lace in texture and design. It is then that the trout enjoy a gross feeding-time, and you can see with a satisfaction the angler alone knows the bold, gloriously hearty rise to a mouthful of fly which, after a few days, shall so have gorged the recipient as to have rendered it lazy and overfed. Nevertheless, when you get it, and it comes to table with a delicious nutty flavour and salmon-red flesh, you pronounce for the Mayfly season after all.

Though in past times, in the columns of the BOY'S OWN PAPER, I have fully given the names of flies which I deemed most suitable for the times of year variously specified, it seems to me fitting to again put down a list of such artificial lures as are likely to be of use to the student of these columns. I give them, and I need only here add in conclusion that almost all tackle-makers will supply them; but if any difficulty occurs, Messrs. Foster, of Ashbourne, Derbyshire, will recognise and dress them according to these particulars. If you desire to learn fly-dressing for yourselves you have only to refer to my previous articles in Vol. III. B.O.P.

LIST OF FOSTER'S STANDARD TROUT FLIES.

Olive Dun Shades ..	{ For February and November, March and October, and April and September.
Dark April Dun ..	{ All capital killers.
Whirling Blue Dun ..	{
Pale Blue Dun ..	{
Yellow Dun of May ..	{ May and August shades.
Hare's-ear Dun ..	{ A splendid early fly on the chalk streams of the south of England.
Golden Dun ..	{ June shade.
Pale Evening White ..	{ July shade.
Pale Evening Dun ..	{ Do. do.
Iron-blue Dun ..	{ For April and May and September and October.
Little Pale Blue ..	{ For August and September.
October Dun ..	{ For October and November.

GENERAL FLIES.

Red Spinner ..	Three shades.
Jenny Spinner ..	
March Brown ..	{ For March and April, May, and June, and August (A.D. 1871).
May Fly ..	{ For early June fishing, three dressings.
February Red ..	
Sand Fly ..	
Cinnamon Fly ..	
Grannom, or Green-tail ..	
Stone Fly ..	
Needle Fly ..	
Yellow Sally ..	
Willow Fly ..	
Cowdung Fly ..	
Oak Fly ..	
Cock-a-bonddhu: Palmers ..	
Wren-tail ..	
Red Ant ..	
Black Ant ..	
Black Gnat ..	
Grey Gnat ..	

There are eight different dressings of the palmers or caterpillars, which in the natural state are supposed to be the larvæ of the *Arctia caja* moth.

TOM STANTON: A STORY OF COUNTRY LIFE.

CHAPTER II.—(continued.)

TOM made a face, and pulled out his handkerchief; but Bart was down on the ground in a moment, and looked as if he would go headlong after his property, while a torrent of reproaches and exaggerated lamentations broke from his lips.

Surprised and offended, Tom stood looking at him. He was not accustomed to being spoken to like this; and though he was too proud to complain of the pain he was in, it seemed strange to have his hurt treated as a thing of no consequence.

"Get up," he said, angrily, at last. "If your ferret is really gone for good, as you say, I will pay you for him."

"Yes, sir," said Bart, rising to his knees and looking up with cunning, furtive eyes; "I shall expect you to do that, indeed. A poor man can't afford to lose what earns his living for a gentleman's sport. And my best ferret it was, and now I shall never set eyes on it again," and he grovelled once more.

"Come on," said Tom, shortly, for his stolen pleasure was beginning to taste bitter in his mouth; "it is getting late, and I must be going. How much do you want for that beast?"

Rising slowly to his feet, Bart stood a minute as if in calculation, scanning the boy's face once or twice doubtfully.

"Why, now, look here, sir," he said at last, producing the companion ferret, "it is no use trying to deceive a gent like you; but just cast your eye over this little animal. You see what he is; as near perfection for a ferret as may be. Well, then, the other as is gone was, I should say, as superior to this one as a prize lop-ear is to a' ordinary bunny. And clever! Ah! That's what I grieve about. Natural talent like that can't be picked up every day."

"Oh yes, I know, of course," broke in Tom, who was losing patience; "but the question is, what do you want for him?"

Bart shifted his feet and put up his ferret carefully.

"Fifteen shillin's," he said, doggedly, "and not a penny less."

Tom exclaimed in dismay, while the blood rushed to his face. "Look here!" he said, putting his hand in his pocket and drawing out some small silver, "this is all that I have now."

Bart laughed as if in scorn.

"It isn't a bit of use to offer me that, sir; but seeing that you are one as would wish to do what is right, perhaps I had better speak to Squire Stanton about it."

The man's furtive eyes watched the boy closely while speaking.

Tom stood looking all round in great perplexity. In spite of his short acquaintance with his uncle he felt instinctively that here was a guardian who, however kind, would brook no disobedience. This must be hidden from him at any cost. Tom had never had to suffer for his faults, so he did not fear punishment; but he was anxious to gain the approbation of his father's brother that a good account might be written of him to the only being for whom he cared much in the world. He was sorry now that he had done what he knew was forbidden, but at present the only thing to

be thought of was how the thing could be concealed. Humiliating as it might be, this fellow's mouth must be closed.

"Look here," he said, sullenly; "if you speak to my uncle there will only be a row, and perhaps you won't get anything"—here Bart shook his head confidently—"but if you hold your tongue you shall have your money in time, and perhaps something more. I shall be getting a tip from my father soon, I think."

Bart grumbled that it was "hard to be kept out of one's own," but "to oblige" Tom agreed to say nothing about his loss for the present.

"You'll be able to give me something now and then, sir, I suppose?" he concluded.

"Oh, yes," said Tom, to whom the whole business had become most distasteful. "Here, take this, and now I'm off."

"Good evening, sir, and mum's the word between you and me," said Bart, breaking into a grin as, after watching the boy out of sight, he lit his pipe and sat down comfortably in the confident expectation of his ferret's reappearance in a minute or two.

Unobserved Tom reached the house and got up into his own room. It was late, but the other boys were still out, and Mr. and Mrs. Stanton had evidently not yet returned. Slowly he began to dress for dinner, for his finger was very painful and hindered him. It was not long before the boys' voices sounded downstairs, and Bertie's thick boots came running along the passage to his cousin's room.

"Tom, are you there? Why, where have you been all the afternoon?" he said, coming in.

"Where have you been, you mean?" said the other, with his fatal facility in making excuses. "Why, I have had a splendid walk by myself all over the place, and never saw you anywhere!"

"No, I should think not," answered Bertie. "We never thought you would go off like that by yourself. Why didn't you tell us?"

"Well, I was always expecting to meet you every moment. What have you been doing?"

"Oh, we have been at the farm all the time; but I'll tell you afterwards, or I shall be late for dinner."

The evening passed off pretty easily for Tom. He had almost forgotten his afternoon adventure, when suddenly at dinner his uncle asked him if he had hurt his hand, as his handkerchief was twisted round his finger.

With a beating heart Tom answered glibly that he had cut it with his knife. Mrs. Stanton asked if it was a bad cut, and on hearing that it was not, told him to ask one of the maids for some plaster, and the subject dropped.

That night, though, Tom's sleep was broken and disturbed. His compact with Bart weighed on his mind. Even if he wrote at once to his father and asked for the money it would be nearly two months before he could get an answer, and in the meantime his uncle was only to supply him with the same pocket-

money as his cousins received. Toss and turn as he might, he could see no way out of his dilemma, and with time confession was only becoming more difficult. How could he stand up before the guardian, who resembled so strongly his own father far away, and tell him that his brother's son had been guilty of the meanness of falsehood and deceit? No, anything rather than that. His uncle's good opinion must be kept at any price. Dead secrecy for the present, and in the future who could tell what might turn up?

(To be continued.)

THE "BOY'S OWN" GORDON MEMORIAL FUND.

(Continued from page 543.)

WHAT curious boys some are who hail from the north! Thus a Kilmarnock correspondent writes to ask if "there are not boys in Glasgow, Edinburgh, and Dublin as well as London," and to suggest that we should raise a Home in each of those cities as well as in London. He then adds: "Again, I would like you to remember that General Gordon was of *Scottish* descent," and finishes off by sending us just—*nothing* towards the fund that, in his view, ought to accomplish so much! Precisely the same thing occurred in regard to our previous efforts. The boys who wrote frequent letters as to how many life-boats should be subscribed for, and precisely where they ought to be placed, invariably forgot either to give or collect even the smallest current coin of the realm towards the work. It is certainly not in this way that the "Boy's Own" Gordon Memorial will be raised. Now is obviously the time for united effort, and not for impossible advice!

Might we also remind such correspondents that London not only accommodates more inhabitants than the whole of Scotland, and that there are more Scotchmen in it than in Edinburgh itself, but also, as the greatest city in the world, it is peculiarly representative of all classes. Thither, in great numbers, come the youth of Scotland and Ireland, and from all parts of England lads pour in by tens of thousands to seek that "fortune" which to most of them never comes.

Amongst the multitude of books recently issued on General Gordon, one published by W. Rice, and entitled "Epitaphs on C. G. Gordon," has peculiar interest. It is, it seems, the outcome of an offer by the proprietors of "The Journal of Education" of a prize for the best epitaph on Gordon. Out of more than two hundred compositions sent in, ten have been selected for publication, and others are added by contributors to the paper. Several are in Latin or Greek, and all exhibit profound admiration for their subject. Here is one of those in English, signed "F. W. B."—

Happy who in their hour of triumph die!
More noble he, who, 'mid the desert sand,
Held light his own life, death, or victory;
So God he served, and helped that hapless land!

One of the best Latin ones commences thus:—

Nubia te plorat raptum, te Serica tellus,
Qualibet oppressæ gentis amicus eras.

The American poet Whittier, having expressed a desire that Lord Tennyson might see his way to write a poem on Gordon, the Laureate has replied thus:—

"DEAR MR. WHITTIER, — Your request has been forwarded to me, and I herein send you an epitaph for Gordon in our Westminster Abbey—that is, for his cenotaph:—

"Warrior of God, man's friend, not here below,
But somewhere dead far in the waste Soudan;
Thou livest in all hearts, for all men know
This earth hath borne no simpler, nobler man.

"With best wishes, yours very faithfully,
"TENNYSON."

WORDS OF CHEER.

A Chester clergyman writes: "I recognise in your work something far higher than the desire to please. Your paper is doing more than can be told for the youth of England."

"Yachtsman" (Bristol), writes: "Your paper is admired by all. I have seen engine-drivers, dock labourers, navvies, carpenters, and many others reading it, and quite a score of men round one number, eager to look at it."

OUR NOTE BOOK.

REFERRING to the late Mr. W. E. Dodge, the Rev. Newman Hall quotes the following lines as having formed the favourite motto of that eminent philanthropist. They may serve to guide others to firmer and simpler faith in God as the daily Guide and Helper of His people:—

"Build a full, firm fence of faith all about to-day;
Fill it in with useful works, and within it stay.
Look not through the sheltering bars, anxious for to-morrow,
God will help whatever comes, be it joy or sorrow."

RELIGION IN DAILY LIFE.

"Without any distinct or immediate reference to God, we may honour Him by taking His gifts with a thankful heart for a temperate enjoyment. We may prove ourselves under law to Him by shunning all excess, by showing that we hate the sneer that wounds a neighbour, and find no wit in the jest that taints the spirit, or by studying to give others pleasure at our own expense. Lads in the cricket-field need not break out into psalms and hymns; they may prove themselves religious by their strict honour, their consideration for their playmates, their good temper under defeat, their readiness to give credit to their opponents. . . . By keeping their tastes simple, their tempers sweet, their hearts pure and tender and grateful, they may make their whole life a psalm of worship and praise."—*Rev. Samuel Cox, D.D.*

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

II.—Illumination Competition.

(Continued from page 559.)

MIDDLE SUBDIVISION (ages 16 to 18).

As explained in our last number, so many readers have competed in the Middle Division, and so much of the work has been really excellent, alike as to freshness of design and painstaking execution, that we resolved to cut the division in half, and increase and readjust the prizes.

Our Award is as follows:—

Prizes—One Guinea each.

HERBERT COOPER (aged 16), 8, King's College Road, Adelaide Road, South Hampstead.
CHARLES F. CAMPBELL (aged 17), 54, Liverpool Road, Islington, N.

Extra Prize—10s. 6d.

D. ENOCK (aged 17), Hill Crest, Lickey Hills, Bromsgrove.

Certificates.

ALLEN E. THOMPSON, 2, Park Walk, Stockwell Road, S.W.

ALFRED E. HILLMAN, 28, Brabourne Grove, Peckham, S.E.

WM. SMITH, JUN., 46, Holburn Road, Aberdeen.

EDWD. BASTAIN, 90, Arlington Road, Camden Town, N.W.

H. R. ADAMS, Fairfield, Farnham, Surrey.

H. C. BECKINGSALE, 2, Clarence Parade, Cheltenham.
THOS. K. WOODCOCK, The Gardens, Oakbrook, Rawmoor, Sheffield.

FRANK W. MANN, 49, Merrow Street, Walworth, S.E.

J. T. JACKA, Hea Villa, Hea, near Penzance, Cornwall.
ERNEST ANDERSON, Old Road, Wateringbury, near Maidstone.

ERNEST G. MAXWELL, 263, Romford Road, near Forest Gate, Essex.

NORMAN FRASER, 13, Athole Gardens, Kelvinside, Glasgow.

ALEXANDER FRASER, 26, Holburn Road, Aberdeen.

JOHN E. TAYLOR, care of Messrs. Grundy and Son, 54, John Dalton Street, Manchester.

RAYMOND H. AVERNS, King Field, Coventry.

G. R. ENOCK, Hill Crest, The Lickey, Bromsgrove.
CLARENCE ISACKE, 47, Heathfield Road, Handsworth, Birmingham.

EDWD. H. HEAZELL, The Private Road, Mapperley, Nottingham.

HERBERT J. THORPE, 25, Oak Terrace, Halifax.

JOHN BAYES, 56, Upper North Street, Poplar, E.

GEORGE L. STEVENS, 6, Mount Pleasant, Merton Road, Wandsworth, S.W.

WALTER R. SIMMONDS, New Romney, Kent.

GEORGE C. LOSACK, 16, Hazlemere Road, Peckham.

GEORGE H. DAVIES, 6, Judd Street, Euston Road, W.C.

JOHN W. BIRCHENALL, Kennedy Grove, Mile End, E.

H. C. WALLACE, 20, Lambert Road, Brixton Rise, S.W.

W. HOPKINSON, 27, Queen Street, Brompton Road, S.W.

JOHN R. T. COURT, 16, Warwick Street, New Cross, S.E.

FREDK. W. GREGORY, 29, Kingsmead Terrace, Bath.

WILLIAM READ, 59, Victoria Street, Blackburn.

THOMAS H. SMEDLEY, Nottingham Road, Stapleford, Notts.

WILLIAM WILSON, 5, Melbourne Place, Edinburgh.

W. H. ROYLE, 3, Millbrook Villas, Upper Park Road, New Southgate, N.

RAYMOND T. BERTHON, Southcombe, Paignton.

NELSON CHRISTOPHERSON, 15, Upper Winchester Road, Catford, S.E.

WILLIAM T. JARVIS, 3, Rail Villas, Fairfield Road, Chelmsford.

HENRY T. EARL, Belgrave House, 151, King's Road, Canton, Cardiff.

WALTER R. GREENFIELD, Holmesdale, Chesswood Road, Worthing.

J. J. SUTTON, Ashleigh, Westhill Road, Wandsworth.

P. C. C. DAVIS, 231, Seven Sisters Road, N.

T. FISHER, 12, Manchester Road, Southport.

WALTER G. TUCKNELL, 315, Broad Street, Birmingham.

ARTHUR HOLT, 123, Orchard Street, Pendleton, near Manchester.

FRANK W. BURT, West End, Christchurch, Hants.

G. L. WOOLLIAMS, 36, Pimlico Road, Pimlico.

ROLAND JOHN PECK, 1, Canonbury Square, N.

CHARLES SPARY, 188, Ellesmere Road, Eccles, near Manchester.

R. H. L. TUCKER, The Shrubbery, South Molton, Devon.

GEORGE HARE, 73, Bousfield Road, Nunhead, S.E.

ARTHUR N. SAMPSON, 17, Frederick Street, Gray's Inn Road, W.C.

LEONARD S. GREEN, Calais Cottage, 33, Cleveland Road, Higher Crumpsall, Manchester.

WALLACE YEATES, 42, Atlantic Road, Brixton, S.W.

A. C. REMNANT, 19, Mardale Street, Shepherd's Bush, W.

ARTHUR J. FORBES, Deaf and Dumb Institution, Brighton.

FREDK. J. MAJOR, 69, Peckham Park Road, Old Kent Road, S.E.

BERNARD LAWSON, 4, Earliston Place, London Road, Edinburgh.

W. B. THOMSON, 66, Elm Street, Humberstone Road, Leicester.

ALFRED L. GOODALL, 2, St. Stephen's Villas, Chatsworth Road, Lower Norwood.

JOHN H. ROBSON, 3, Osborne Place, Bensham Road, Gateshead-on-Tyne.

EDWIN FANSHAW, 155, Eccleshall Road, Sheffield.

JOHN M. FLINT, 43, Somerville Road, New Cross, S.E.

T. A. DERMOTT, 82, High Street, Whitechapel, E.

A. P. FROST, 30, London Road, Horsham.

A. F. MORROW, 10, New London Road, Chelmsford.

W. A. STAINTON, 6, Shaftesbury Villas, Hornsey Rise, N.

T. W. PALMER, South Farm, Berrow, near Burnham, Somerset.

FREDK. RITCHIE, Grammar School, Garston.

PERCY VELLENOWETH, 12, Sugden Road, Lavender Hill, Clapham Junction, S.W.

FREDK. PLAMPING, 1, Howland Mews West, Fitzroy Square.

HENRY MACKRELL, Bushey Paddocks, Hampton Wick.

THOMAS F. MATTHEWS, 79, Appach Road, Brixton.

M. G. BRYAN, 16, Gough Street, Gray's Inn Road, W.C.

ELPHEGE J. PIPPET, Solihull, Birmingham.

CHARLES H. MARSH, 3, Avalon Buildings, Glastonbury, Somerset.

FRED. PLUMER, Elmhurst, Lee, Kent.

GEORGE PITTMAN, Rolle Street, Exmouth.

BRUCE FRESHWATER, Coventry Street, Market Harborough, Leicestershire.

PHILIP J. GILL, 150, Regent's Park Road, N.W.

CLEMENT WHITE, 102, Ifield Road, West Brompton, S.W.

REGINALD T. DICK, 22, Brunswick Square, W.C.

JAMES J. BLOCK, 108, Blackfriars Road, London, S.E.

GEORGE ROBSON, 35, Blake's Roa, Peckham.

D. F. WILLS, 16, Argyle Place, Edinburgh.

FRANK H. DONALLY, 54, Canterbury Road, Ball's Pond Road, N.

R. HAMILTON, 14, Little Queen Street, Holborn.

F. W. RAYNER, 32, Noel Street, Islington, N.

Correspondence.

WALTER (Bristol).—The 81-ton gun is 27ft. long outside, and has a bore 16in. in diameter and 24ft. in length. The outside diameter at the muzzle is 2ft., and at the breech 6ft. Its weight with carriage exceeds 120 tons. It is said to be able to send a shot through a 24-in. iron plate at a range of ten miles. The weight of the shot is about 1,250lb., and that of the powder 240lb., in grains as big as lumps of washing-blue, about an inch and a half square.

BOY WRITER.—Such information only holds good for the year in which it is published. The regulations are all different, and you would not be eligible.

BOANERGES.—Indian clubs cost from sevenpence to ninepence per pound. You can get them from any cricket outfitter's. The articles on their use appeared in our August and September parts for 1882.

RICHARDS.—All the volumes are kept in print. You can refer to the indexes of those you have for the way to make birdlime.

J. B. CLUTTERBUCK.—Guides to the Civil Service are published by Stanford, by Warne, by Cassell, by Ward, Lock, and Co., etc., etc., and can be obtained from any bookseller.

G. V. P.—The sentences have different meanings. "She looked beautiful" is correct, and "she looked beautifully" is correct; but it all depends on what sense you attach to the "looked." In the last phrase she used her own eyes, in the first you used yours.

D. M. E.—The London Model Yacht Club sail their matches on Thursdays at the Round Pond, Kensington Gardens; the Model Yacht Sailing Association generally sail on Mondays on the same water. There is no compulsion, but it is an act of common courtesy to keep your own boat off the water while racing is going on.

SORTHYSH KHAN.—You will find Gog and Magog described in "Arms of the City Companies" in the part for last October.

F. SHELLEY.—The subject is too important to be dealt with here. We are arranging for some articles on it.

A BIRMINGHAM LAD.—Your lantern is a very good one. The best lanterns have the most lenses. If you have room to fix it a duplex paraffin lamp would give most light. The objection to paraffin is that it gives off great heat. To make the limelight apparatus you would require the bags, and those you could hardly make. In our first volume we had a series of articles on the magic-lantern, and in them you will find the oxyhydrogen apparatus described.

B. PETERSON.—You might try Palmer's "Index to the 'Times' Newspaper" for the year. The speeches are indexed under the speakers' names, so that the task would not be a lengthy one. You will find the index at most public libraries.

CANADA.—The Government Department of Agriculture of Canada publishes a guide-book containing information for intending settlers. It can be had from the offices in Victoria Street, or from Messrs. W. H. Smith and Son at the bookstalls. It contains 140 pages of matter, is beautifully illustrated with drawings by the Princess Louise, and costs one penny.

F. J. FIELD.—We have no room at present for a story of the character you name.

B. ROWLAND and TARTAR.—Scrape the tar off with a scraper, and give a coat of American potash to loosen that in the pores of the wood. The American potash should be dissolved in boiling water, and put on overnight with a mop made of rags, as it destroys any good mop or brush. After the potash is scrubbed off, and the plank has become thoroughly dry, it should be gone over with a very sharp scraper, and finished with glass-paper to get a smooth surface. The plank will then require one, if not two, coats of red lead, to cover up the remains of the tar stains in the plank, before putting on any other paint. If the boat is too large to be turned bottom up, and the tar very thick on the bottom, the most effectual plan is to use an old frying-pan as a grate, lashing it on to a wooden handle about three feet long, and using for fuel some old tar-barrel staves split up. One man holds this under the bottom of the craft to melt the tar, and a second, having a scraper on an iron bar, scrapes off the melting tar through the fire. The scraping must be completed with a sharp scraper when the plank has got cold. When made smooth apply the red lead. If no tar shows through the first coat, one coat will be sufficient; if the stains of tar are visible, give a second coat. It should be remembered that coal tar under water stands better than most kinds of paint, and is a good groundwork for all anti-fouling compositions which are mixed with naphtha. It is, therefore, necessary only to make the surface of the tar smooth if one of these compositions is to be applied, and not to eradicate the stains of the tar from the wood, as for painting. Paint for a boat's bottom, if the boat is constantly kept afloat, should have much verdigris in it, as it checks the growth of weed.

CYPRIEN.—Platnauer's, in Fetter Lane, E.C., is specially established for the sale of back numbers and missing parts of periodicals and magazines. You might get the information there. If not, advertise in one of the trade papers, such as the "Bookseller" or the "Publishers' Circular."

H. M. WILLY.—Get Mr. Gray's book on "Going to Sea," published by Simpkin, Marshall, and Co., and Kent and Co., price one shilling. It will answer all your queries in full.

FORE HATCH.—There are no photographs of engines, and the subject is too technical for us to enter into. For a list of the model yacht clubs buy the "Model Yachtsman," monthly, price twopence, from Marlborough and Co., Old Bailey, E.C. In the part for May, 1881, you will find an article on rigging and sailing; but if you have any special plans you might send on approval.

FIDDLE STICK.—A list of all the ships of the Royal Navy is given in the Navy List; and a list of the regiments of the Army is given in the Army List, both of which you can obtain through any bookseller.

AUBREY ST. JOHN (Dalkeith, N.B.).—We never answer questions that reach us in unstamped envelopes.

J. J. M.—The rooms of the Linnean Society are in Burlington House. You have to be proposed and seconded by Fellows, who guarantee your fitness from personal knowledge.

HUSSAR.—Every regiment in the British Army is open to receive recruits if of suitable height, health, and character.

W. M.—Have a cold bath every morning, and walk five miles a day. "The Ever Victorious Army," by Andrew Wilson, is still on sale, published by Blackwood and Sons.

J. G.—The coin is a Scotch bawbee of the reign of William III.

L. G. HALL.—On application to Messrs. Hachette, of King William Street, Strand, you may be able to buy sample copies of the two French publications for the young, "Education—Recreation," and "La Jeunesse." Both are illustrated.

A YOUNG SQUIRREL.—Answered before. A "Vinegar Bible" is one in which the word vineyard is misprinted vinegar. The "best cement for mending fossils" depends on the nature of the rock; but the following is very good for general use. Mix together two parts of gum arabic, two parts of ground white lead, and one part of powdered sugar-candy, and pour a little hot water on them; stir the mixture each time you use it, and add more water when needful.

C. G. W.—We fear your bird has blood poisoning. Feed only on canary-seed, and it may pull round. Put about ten drops of tincture of iron in its fresh drinking-water every morning.

REGULAR READER.—If you have to write again please adopt a more definite *nom de plume*. 1. The reason your hen lays soft eggs, despite her having lime and a good run, is overfeeding. Give grain, and in her soft food put powdered oyster-shell. 2. Very likely to, we fear.

N. LEE.—The way to make linseed-oil birdlime was described in No. 197, in the part for November, 1882.

A. McL.—The surest plan is to number the backs of the books with an indiarubber stamp. If you prefer adhesive labels use Stickplast instead of gum. You can get the stickplast from almost any stationer. It is manufactured by Field and Tuer, Leadenhall Street Press.

E. H. F.—They have all been given in our pages. See indexes. The rose is from the incident in Temple Gardens; the shamrock is from the plucking of its leaf by St. Patrick to illustrate the doctrine of the Trinity; the leek is from the Britons wearing it in their hats, at the suggestion of St. David, during the battle with the English. For the harps see the National Arms in Vol. III.

W. A. WHITE.—We would suggest the Dee as a pleasant river for a trip. The cost of a boat for a week would be about £3. You can average the hire of a rowing boat at ten shillings per day.

GRAPH.—A simple one? P. H. A. tells us by this post that three-quarters of a sixpenny packet of Nelson's gelatine dissolved in half a pint of water is the best. We cannot vouch for this, but we can understand that almost any good jelly would serve for a few pulls.

J. H.—The hemp-seed is the cause of your canaries losing feather. Stop that, and they will get right.

CONEY.—You can keep about eight or even ten in the space you indicate. Let them have outdoor exercise, though. Rabbits do not do well always confined.

D. S. N.—You are right in your conjecture, and the sooner you get rid of them the better. Have the cage examined at once and thoroughly cleansed. Rub the tiniest bit of blue ointment behind the bird's neck, not bigger than a small pea.

C. D. G. A.—Under no circumstances whatever would we undertake to criticise or publish a serious drama.

GUINEA PIG.—The floor of the hutch should be kept cleaned, or it will soon become unbearable. TINY (of Muswell Hill, N.) sends us the following, which may put you on the right track: "GUINEA-PIGS' HUTCHES."

—Our hutches have zinc linings to the floors, and removable boards laid on these for facility in cleaning. For some time past we have put, instead of the boards, dry earth about an inch thick on the zinc, with the usual litter of hay or straw upon it. This seems to answer very well. There are two pigs in each hutch, and we change the earth twice a week. The hutches are much drier, and smell less, and the floor is warmer for the pigs than damp boards were. We dry the earth in a shallow box before the study fire, but in the summer it could be got more easily, and we intend then to use it over the whole of the hutch floor, and not only in the sleeping-room as we do now. Has this dry-earth plan been tried before for rabbits or guinea-pigs? It is what they are accustomed to in a state of nature.

H. H. HEALEY.—We can give you no rule because there is none. Each fowl should have enough to eat greedily, but no more; some eat far more than others.

J. D.—Wash the dog twice a week, and afterwards dress all the sore places with the following liniment: Olive oil, seven ounces; creosote, half an ounce; liquor potassae, one ounce. Alter the diet to one less stimulating.

G. O. C. COBBINS.—You must study our rabbit articles. There is no difference in the treatment of show rabbits from that of any other.

No. 335.—Vol. VII.

SATURDAY, JUNE 13, 1885.

REGINALD CRUDEN: A TALE OF CITY LIFE.

By TALBOT BAINES REED,

Author of "My Friend Smith," etc., etc.

CHAPTER XI.

REGINALD TAKES HIS FATE INTO HIS OWN HANDS.

THE next day Reginald wrote and accepted the invitation of the directors of the Select Agency Corporation. He flattered himself he was acting deliberately, and after fully weighing the pros and cons of the question. True, he still knew very little about his new duties, and had yet to make the acquaintance

"He sat staring at the bill."

of the Bishop of S— and the other directors. But, on the other hand, he had seen Mr. Medlock, and heard what he had to say, and was quite satisfied in his own mind that everything was all right. And, greatest argument of all, he had no other place to go to, and £150 a year was a salary not to be thrown away when put into one's hands.

Still he felt a trifle uncomfortable about the necessity of going to Liverpool and breaking up the old home. Of course he could not help himself, and Horace had no right to insinuate otherwise. All the same, it was a pity, and if there had not been the compensating certainty of being able to send up regular contributions to the family purse, which would help his mother to not a few comforts hitherto denied, he would have been more troubled still about it.

"What will you do about the £50?" said Horace next day, forcing himself to appear interested in what he inwardly disapproved.

"Oh," said Reginald, "I'd intended to ask Richmond to lend it me. It's not exactly a loan either; it would be the same as his investing in the company in my name. The money would be safe, and he'd get his interest into the bargain. But of course I can't go to him now."

"No, and I don't know whom else you could ask," said Horace.

"They might let me put in a pound a week out of my salary," said Reginald. "That would still leave me two pounds a week, and of that I could send home at least twenty-five shillings."

Horace mused.

"It seems to me rather queer to expect you to put the money in," said he.

"It may be queer, but it's their rule, Mr. Medlock says."

"And whatever does the Corporation do? It's precious hazy to my mind."

"I can't tell you anything about it now," said Reginald; "the concern is only just started, and I have promised to treat all Mr. Medlock told me as confidential. But I'm quite satisfied in my mind, and you may be too, Horace."

Horace did not feel encouraged to pursue the discussion after this, and went off alone to work, in low spirits and feeling unusually dismal.

"By the way," said Reginald, as he started, "bring young Gedge home with you. I meant to see him last night, but forgot."

Reginald spent the day uneasily for himself and his mother in trying to feel absolutely satisfied with the decision he had come to and in speculating on his future work. Towards afternoon, weary of being all day in the house, he went out for a stroll. It was a beautiful day, and the prospect of a walk in the park by daylight was a tempting one.

As he was passing down Piccadilly he became aware of some one approaching him whom he knew, and whom in another moment he recognised as Blandford.

There was some excuse certainly for not taking in his old schoolfellow's identity all at once, for the boy he had known at Wilderham only a few months ago had suddenly blossomed forth into a man, and had exchanged the airy bearing of a schoolboy for the half-languid swagger of a man about town.

"Hullo, Bland, old man!" exclaimed Reginald, lighting up jubilantly at the

sight of an old familiar face, "how are you? Who would have thought of seeing you?"

Blandford was surprised too, and for a moment critically surveyed the boy in front of him before he replied.

"Ah, Cruden, that you? I shouldn't have known you."

Reginald's face fell. He became suddenly aware, and for the first time in his life, that his clothes were shabby, and that his boots were in holes.

"I shouldn't have known *you*," he replied; "you look so much older than when I saw you last."

"So I am; but, I say," added Bland, reddening as an acquaintance passed and nodded to him, "I'm rather in a hurry, Cruden, just now. If you're not engaged this evening come and dine with me at seven at the 'Shades,' and we can have a talk. Good-bye."

And he went on hurriedly, leaving Reginald with an uncomfortable suspicion that if he—Reginald—had been more smartly dressed, and had worn gloves and a tall hat, the interview would have been more cordial and less hasty.

However, the longing he felt for the old happy days that were past decided him to appear at the "Shades" at the hour appointed, although it meant absence from home on one of his few remaining evenings, and, still more, a further desertion of young Gedge.

He repented of his resolution almost as soon as he had made it. What was to be gained by assuming a false position for an evening and trying to delude himself into the notion that he was the equal of his old comrade? Did not his clothes, his empty pockets, the smart of Durfy's tongue, and even the letter now on its way to Mr. Medlock, all disprove it? And yet three months ago he was a better man all round than Blandford, who had been glad to claim his friendship and accept his father's hospitality. Reginald rebelled against the idea that they two could still be anything to one another than the friends they had once been, but all the while the old school saw came back into his mind—that imposition sentence he had in his day written out hundreds of times without once thinking of its meaning: "Tempora mutantur et nos mutamur in illis."

He reached the "Shades" a few minutes before seven, and waited outside till his friend arrived. He had not to wait long, for Blandford and a couple of companions drove up punctually in a hansom—all of them, to Reginald's horror, being arrayed in full evening dress.

"Hullo, Cruden, you've turned up, then," said Blandford. "What, not in regimentals! You usen't to be backward in that way. Never mind; they say dress after seven o'clock here, but they're not strict—we can smuggle you in."

Oh, how Reginald wished he was safe back in Dull Street!

"By the way," continued Blandford, "these are two friends of mine, Cruden, Mr. Shanklin and Mr. Pillans. Cruden's an old Wilderham fellow, you know," he added, in an explanatory aside.

The gentleman introduced as Mr. Shanklin stared curiously at Reginald for a few seconds, and then shook hands. Had the boy known as much of that gentleman as the reader does he would probably have displayed considerably more interest in his new acquaintance than he

did. As it was he would have been glad of an excuse to avoid shaking hands with either him or his empty-headed companion, Mr. Pillans. He went through the ceremony as stiffly as possible, and then followed the party within.

"Now then," said Blandford, as they sat down at one of the tables, "what do you say? It'll save trouble to take the table d'hôte, eh? are you game, you fellows? Table d'hôte for four, waiter. What shall we have to drink, I say? Hock to start with?"

"I won't take any wine," said Reginald, with an effort.

"Why not? You're not a teetotaler, are you?"

"I won't take any wine," repeated Reginald, decisively; and to his satisfaction he was allowed to do as he pleased.

The dinner passed as such entertainments usually do; diminishing in interest as it went on. In his happiest days Reginald always hated what the boys used to call "feeds," and he found that three months' altered circumstances had by no means reconciled him to the infliction. He shirked the last two or three courses, and grew heartily tired of the sight of a plate.

"You wondered how I came to be in town?" said Blandford. "The fact is my uncle went off the hooks a few weeks ago, and as I'm his heir, you know, I came up, and haven't gone back yet. I don't think I shall either."

"No, what's the use, with the pot of money you've come in for?" said Mr. Shanklin; "you're far more comfortable up in town."

"Yes, and *you're* a nice boy to show a fellow about town," said Blandford, laughing.

"Wilderham's all very well, you know, Cruden," continued he, "but it's a grind being cooped up there when you've got your chance of a fling."

"Well, you've not wasted your chances, my boy," said Mr. Pillans, who, besides being empty-headed, was unhealthy in complexion and red about the eyes.

Blandford appeared rather flattered than otherwise by this observation, and told Mr. Pillans to shut up and not tell tales out of school.

"I suppose Wilderham hasn't changed much since last term?" asked Reginald, wistfully.

"Oh, no; plenty of fellows left and new ones come—rather a better lot, take them all round, than we had last term."

"Has the football club been doing well again?" asked the old boy.

"Oh, middling. By the way, the fellows growled rather when you only sent them half-a-sov. instead of a sov."

Reginald coloured up. Little his comrade knew what that half-sovereign had cost him!

He relapsed into silence, and had to derive what compensation he could from the fast talk in which the other three engaged, apparently heedless of his presence.

In due time the meal ended, and Blandford called for the bills.

Until that moment Reginald had never imagined for a moment but that he had been dining as his old schoolfellow's guest. He had understood Blandford's request of his company as an invitation, and as an invitation he had accepted it, and as an invitation he had repented of it. What, then, was his embarrassment

to find a bill for six shillings and sixpence laid down before him as his share of the entertainment.

For a moment a flush of relief passed across his face. He was glad not to find himself under obligations to Blandford after all. But in another moment relief was changed to horror as he remembered that three shillings was all the money he had about him. Oh, the humiliation, the anguish of this discovery! He would have had anything happen rather than this.

He sat staring at the bill like a being petrified.

"Come along," said Blandford, "let's go to the smoking-room. I suppose you fellows will have coffee there. Coffee for four, waiter. Are you ready?"

But Reginald did not move, nor did the waiter.

"What's the row?" said Blandford to the latter.

The waiter pointed to Reginald's bill. "Oh, he's waiting for your bill, Cruden. Look sharp, old man!"

The colour came and went in Reginald's face, as though he had been charged with some hideous crime. And it seemed like a deliberate mockery of his trouble that his three companions and the waiter stood silent at the table eyeing him and waiting for his answer.

"I'm sorry," he said at length, bringing up the words with a tremendous effort, "I find I've not money enough to pay it. I made a mistake in coming here."

All four listeners stood with faces of mingled amazement and amusement at the boy's agitation and the tragic manner in which he accounted for it. Any one else would have carried it off with a jest, but to Reginald it was like passing through the fire.

"Would you mind—may I trouble you—that is, will you lend me three-and-sixpence, Blandford?" he said at last.

Blandford burst out laughing.

"I thought at least you'd swallowed a silver spoon!" said he. "Here, waiter, I'll settle that bill. How much is it?"

"No," said Reginald, laying down his three shillings; "if you can lend me three-and-sixpence, that's all I want."

"Bosh!" said Blandford, pitching half-a-sovereign to the waiter, "take it out of that, and this coffee too, and come along into the smoking-room, you fellows!"

Reginald would fain have escaped, but the horrid dread of being suspected of caring more about his dinner than his company deterred him, and he followed dejectedly to the luxurious smoking-room of the "Shades."

He positively refused to touch the coffee or the cigar, even though Blandford took care to remind him they had been paid for. Nor, except when spoken to, could he bring himself to open his lips or take part in the general talk.

Blandford, however, who, ever since the incident of the bill, seemed to consider himself entitled to play a patronising part towards his old schoolfellow, continued to keep him from lapsing into obscurity.

"Where's your brother living?" he asked, presently.

"He's in town too," said Reginald. "My mother and he and I live together."

"Where? I'd like to call on your mother."

"We live in Dull Street," said Reginald, beginning in sheer desperation to

pluck up heart and hang out no more false colours.

"Dull Street! That's rather a shady locality, isn't it?" said Mr. Pillans.

Reginald rounded on him. Blandford might have a right to catechise him; but what business was it of this numskull's where he lived?

"You're not obliged to go there," he said, with a curl of his lip, "unless you like."

Mr. Shanklin smiled at this sally, a demonstration which considerably incensed the not too amiable Mr. Pillans.

"I'll take precious care I don't," said the latter.

Reginald said "Thanks!" drily, and in a way so cutting that Mr. Shanklin and Blandford both laughed this time.

"Look here," said the unwholesome Pillans, looking very warm, "what do you say that for? Do you want to cheek me?"

"Don't be a fool, Pillans. It doesn't matter to you where he lives," said Blandford.

"Thank goodness it don't—or whether he pays his rent either."

"It's a pity you had to leave Garden Vale," said Blandford, apparently anxious to turn the conversation into a more pacific channel; "such a jolly place it was. What do you do with yourself all day long in town?"

Reginald smiled.

"I work for my living," said he, keeping his eye steadily fixed on Mr. Pillans, as if waiting to catch the first sign of an insult on his part.

"That's what we all do, more or less," said Mr. Shanklin. "Blandford here works like a nigger to spend his money, don't you, old man?"

"I do so," said Blandford, "with your valuable assistance."

"And with somebody else's assistance too," said Mr. Pillans, with a shrug in the direction of Reginald.

Reginald understood the taunt, and rose to his feet.

"You're not going?" said Blandford.

"I am. I don't forget I owe you for my dinner, Blandford; and I shan't forget that I owe you also for introducing me to a blackguard. Good night."

And without allowing his hearers time to recover from the astonishment into which these words had thrown them, he marched out of the "Shades" with his head in the air.

It was a minute before any of the three disconcerted companions could recover the gift of speech. At last Mr. Shanklin burst out into a laugh.

"Capital, that was," he said; "there's something in the fellow; and," he added, internally, and not in the hearing of either of his companions, "if he's the same fellow Medlock has hooked, our fortune's made."

"All very well," said Pillans; "but he called me a blackguard."

This simple discovery caused still greater merriment, at the expense of the outraged owner of the appellation.

"I've a good mind to go after him and pull his nose," growled he.

"Nothing would please him better," said Blandford. "But you'd better leave your own nose behind, my boy, before you start, or there won't be much of it left. I know Cruden of old."

"You won't see much more of him now," sneered Pillans, "now he owes you for his dinner."

"It strikes me Bland was never safer of a six-and-six in his life than he is of the one he lent to-night," said Mr. Shanklin. "Unless I'm mistaken the fellow would walk across England on his bare feet to pay it back."

Mr. Shanklin, it was evident, could appreciate honesty in any one else. He was highly delighted with what he had seen of the new secretary. If anything could float the Select Agency Corporation the lad's unsuspecting honesty would do it. In fact, things were looking up all round for the precious confederates. With Reginald to supply them with honesty, with easy-going spendthrifts like Blandford and Pillans to supply them with money, and with a cad like Durfy to do their dirty work for them, they were in as comfortable and hopeful a way as the promoters of such an enterprise could reasonably hope to be.

The trio at the "Shades" soon forgot Reginald in the delights of one another's sweet society. They played billiards, at which Mr. Shanklin won. They also played cards, at which, by a singular coincidence, Mr. Shanklin won too. They then went to call on a friend who knew the "straight tip" for the St. Leger, and under his advice they laid out a good deal of money, which (such are the freaks of fortune) also found its way somehow into Mr. Shanklin's pocket-book. Finally they supped together, and then went home to bed, each one under the delusion that he had spent a very pleasant evening.

Reginald was far from sharing the same opinion as he paced home that evening. How glad he should be to be out of this hateful London, where everything went wrong, and reminded him that he was a pauper, dependent on others for his living, for his clothes, for his—faugh! for his dinner! Happily he had not to endure it much longer. At Liverpool he would be independent. He would hold a position not degrading to a gentleman; he would associate with men of intellect and breeding; he would even have the joy of helping his mother to many a little luxury which, as long as he remained in London, he could never have given her.

He quickened his pace and reached home. Gedge had been there, spiritless and forlorn, and had left as soon as he could excuse himself.

"Out of sight, out of mind," he had said with a forced laugh to Horace when the latter expressed his regret at Reginald's absence.

Mrs. Cruden and Horace both tried to look cheerful; but the cloud on the horizon was too large now to be covered with a hand.

When Reginald announced that he had written and accepted the invitation to Liverpool there was no jubilation, no eager congratulation.

"What shall we do without you?" said Mrs. Cruden.

"It is horrid having to go, mother," said the boy, "but we must make the best of it. If you look so unhappy I shall be sorry I ever thought of it."

His mother tried to smile, and said, "Yes, we must try and make the best of it, dear boys, and if we cannot seem as glad as we should like to be, it's not to be wondered at at first, is it?"

"I hope you'll get holidays enough now and then to run up," said Horace.

"Oh, yes; I don't fancy there'll be

much difficulty about that," replied Reg. "In fact it's possible I may have to come up now and then on business."

There was a silence for a few seconds, and then he added, rather nervously,

"By the way, mother, about the £50. I had intended to ask Mr. Richmond to advance it, although I should have hated to do so. But now, I was wondering—do you think there would be any objection to taking it out of our money, and letting it be invested in my name in the Corporation? It really wouldn't make any difference, for you'd get exactly the same interest for it as you got through Mr. Richmond; and of course the principal would belong to you too."

"I see no objection," said Mrs. Cruden. "It's our common stock, and if we can use it for the common good, so much the better."

"Thanks," said Reginald. "If you wouldn't mind sending a line to Mr.

Richmond's clerk to-morrow, he could let me have the cheque to take down on Monday with me."

The three days that followed were dismal ones for the three Crudens. There are few miseries like that of an impending separation. We wish the fatal moment to arrive and end our suspense. We know of a thousand things we want to say, but the time slips by wasted, and hangs drearily on our hands. We have not the spirit to look forward or the heart to look back. We long to have it all over, and yet every stroke of the clock falls like a cruel knell on our ears. We long that we could fall asleep and wake to find ourselves on the other side of the crisis we dread.

So it was with the Crudens; and when at last the little trio stood on the Monday on the platform of Euston Station, all three felt that they would give anything to have the last few days back again.

"I'll write, mother, as often as ever I can," said Reginald, trying to speak as if the words did not stick in his throat.

"Tell us all about your quarters, and what you have to do, and all that," said Horace.

Mrs. Cruden had no words. She stood with her eyes fixed on her boy, and felt she needed all her courage to do that steadily.

"Horror," said Reg, as the guard locked the carriage door, and the usual silence which precedes the blowing of the whistle ensued, "keep your eye on young Gedge, will you? there's a good fellow."

"I will, and I'll—"

But here the whistle sounded, and amid the farewells that followed, Reginald went out into his new world, leaving them behind, straining their eyes for a last look, but little dreaming how and when that little family should meet again.

(To be continued.)

THE TROUT, AND HOW TO CATCH IT.

By J. HARRINGTON KEENE,

Author of "The Practical Fisherman," "Fishing Tackle, and How to Make It," etc.

VIII.—SPINNING THE MINNOW FOR TROUT.

THE ROD.—I think it convenient to go *seriatim* through the tackle required for spinning for trout, and to explain the method of using it afterwards, this procedure having in my opinion the advantage that the learner has the divisions of his subject made for him, and thus a less strain is thrown on the memory. A consideration of the rod proper for trout-spinning will therefore first occupy our attention.

My own preference emphatically is for an East India cane rod of about fourteen feet in length—though this length for narrow streams may be shortened to ten or eleven feet if so desired. The rod is of course by no means so pliable as the stiffest fly-rod, nor is such pliability necessary, seeing that in striking a sharp and decisive stroke is necessary, and this could not be dealt with the whippy weapon in use for fly-fishing. Of course I am referring at this moment exclusively to the requisites for ordinary spinning in contradistinction to the "fly-fishing spinning" of some recent writers in the "Fishing Gazette," which style partakes certainly of the finer art which its name sufficiently indicates. For this style a fly-rod would answer very well, though the rings must be upright, of course, as with the ordinary spinning-rod.

THE LINE is commonly of eight-twist plait silk, dressed with some hard dressing. It does not require to be remarkably fine, though it ought to be strong and of durable make. Some of the so-called American lines are much to be condemned, several instances having come under my notice of most imperfect wearing quality. The length of the line ought to be quite fifty yards, so that as the end which is most used begins to rot, the weak part may be broken off from time to time without seriously shortening the remaining line.

Just a memorandum here of advice—always dry your lines after using by coiling the wet part out on a chair in a dry, warm situation. The practice of leaving the line to dry on the reel is a sadly wasteful one, and not infrequently brings its own punishment in the loss of a good fish.

THE REEL is best of that make known as the Nottingham, and is composed generally of wood and metal. The peculiarity of these winches is that they are very free-running, and allow of the line being used with celerity—a great boon when one properly knows how to manage them. Of course, this free-running may be a great nuisance at first in the hands

of the tyro, but after he has accustomed himself to it, it becomes a great convenience, enabling him as it does to command both rod and line with certainty and efficiency.

The next tackle required for the outfit of the trout-spinner is what is termed the *trace*. Now I am bigoted in this little matter, and believe in nobody's traces but those I make myself. The making is not very troublesome, and I accomplish it thus. I select, first, three-foot strands of some round fairly-fine gut, which it is my practice to stain in dilute ink (Morrell's Bank ink is the best). I then with

to an assemblage of hooks, but it is the terror by which all combinations of tackle possessing more than two hooks is technically designated, whether for trout, salmon, pike, or perch fishing. There are several patterns of flights for trout spinning, and amongst them I especially favour those figured in the illustrations.

Fig. 1 shows a remarkably good style of flight, and is, perhaps, the best for all-round work extant. It is the device of Mr. Foster, to whose sons my thanks are due for the opportunity of using the representation. The

Fig. 1.

the first one form a loop in one end—previously soaking the end in warm water—and, taking my whipping-silk, I attach a small brass swivel at the other end. To the free loop of this swivel I whip one end of another length of gut, and again to this another swivel is attached. The same process is gone through with the next length, and another swivel again placed at its extremity. To the free loop of this a large loop of gut is attached by whipping, and then you have your trace—

"Scientific Angler" thus describes the method of baiting: "First, the lead [A] is inserted in the mouth of the fish, the lips being then closed by the movable lip-hook. This being done, the bait is pierced through from one side to the other by the large hook [B], which should be so placed as to keep the lead well up in the minnow's back. Lastly, one of the pair of tail hooks [C] should be made to slightly curl the tail of the minnow." Fig. 2 shows the minnow or other small fish baited.

Fig. 2.

a trifle over three feet long, and possessing three swivels, which, because they are of brass, cannot rust, as, I am sorry to say, the steel ones frequently do. Some minnow-spinners run some drilled shot on the trace, but I prefer to sink the bait by a weight in its inside, as I shall presently describe.

THE FLIGHT.—Of course, as the attentive reader is quite aware, we are now only speaking of the use of the natural bait, for which the word flight is alone applicable. I do not quite know the origin of the word as applied

Of course the hooks ought for trout spinning in ordinary rivers to be half as large or even smaller. The size of the hooks as shown will do capitally for Thames trout spinning.

Fig. 3 shows the sort of tackle still used by the Scotch anglers. The single or lip-hook is hooked through both lips of the minnow, and one each of the two next double hooks are laid in the bait towards the back, the one of the pair nearest the tail being so placed as to curve the bait slightly. The third pair of hooks is allowed to remain free,

so that when the bait is drawn through the water a fish which would otherwise escape through coming "short," as it is termed, stands an imminent chance of being captured. Of course, a lead is required on the trace for this flight.

Fig. 4 represents the ordinary Thames flight for trout, and is still in high favour on that river. I give it room here, not because it is superior to Fig. 1, but out of deference

Fig. 3.

to the opinion that it is, which many of my angling acquaintances entertain. The method of baiting is as follows. The triplet-hook at A is passed through the centre of the vertebra of the tail of the bait, a little distance from the fork, in such a way as to be very firm. The tail is thus bent, and one of the second triplet-hooks is fixed in the fish rather nearer the back than the belly, so as to keep the tail bent. Next the remaining triplet is inserted, and finally the lip-hook is passed through both lips, a twist of the gut having been previously taken round B to prevent it—being movable otherwise—from slipping. If this flight be put on carefully the bait spins very truly, and is most attractive to large Thames trout, for which fish it is especially suitable.

In Fig. 5 we have the representation of Mr. Francis Francis's trout tackle, which, when

made half the size of the drawing, is a very good style of weapon for all the trouts which take a spinning bait. The method of baiting

sary curve for the spin. The lip-hook (B) is then adjusted through both lips of the bait, and the loose triplet swings on either as it

Fig. 4.

is as follows. The large hook A is entered just above the fork of the tail of the bait, and carried completely through (past the barb)

revolves in the water. Sometimes another hook is whipped in a reverse way at C, so that the bend in the tail caused by A can

Fig. 5.

the vertebra or backbone. It is then turned, so that the tail end of the bait is curved round the bend of the hook; this gives the neces-

come undone. This is not absolutely necessary, however. A lead on the trace is indispensable.

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science, Author of "Harold, the Boy-Earl," etc.

CHAPTER XXII.—SIBERIAN TRAVELLING.

"FORWARD! Trot!" were the sounds that broke that "cheerful monotony" which somebody quaintly calls the jangling of the sledge bells. Besides which there were now four drivers apostrophising, abusing, coaxing, and chaffing their horses, as only Russian coachmen can.

"Away they go, jingle jangle through the snow;" and an hour's fast driving has left the little town far behind them, and they are in the apparently trackless steppe covered with snow, having all the effect of being at sea in a little boat, only not so safe!

The drivers steer by the stars at night, by the position of the sun in the daytime, and are in great measure rather led by the horses than anything else. These sagacious animals seem to calculate where they ought to put their feet down, and are unerring guides until a wind arises or a fall of snow comes that baffles them and foils the driver.

Our travellers, with their unusual escort, had met with no adventures worthy of note until the evening of the first day on the steppe, when they were told that a party of Ostiaks was approaching. Ivan and Madame Steinfeldt peeped through the hood of their sledge to see these denizens of the northern desert. But for the moment there was nothing to be seen.

About midnight the lady was awoke by the sudden halt of her vehicle, and

the subsequent sound of human voices in violent conversation. She withdrew the curtain in front of the hood of her sledge and peeped out, but the cold was so intense that she could hardly bear it. Still she was interested in the scene. The moon was waning and near setting, the stars were shining in supernatural splendour, and from the snow around her there stood out in strong relief about six sledges, each drawn by two reindeer, such as we are accustomed to connect with Esquimaux life. The Ostiaks had come so far with certain valuable furs for sale at Ekaterineburg, and had halted to converse with our party. Their dress of elk-skin with the leather outside, and by consequence the fur in, was curiously ornamented with stitched work showing considerable skill. Their heads were covered with hoods of the same, for, like the Russians, they take great pains to keep the head warm. But, oh, the queer boat-like sledges, and the odd-looking deer that drew them, and the statue-like figures of the soldiers with their bashliks, looking like knights of the tenth or eleventh century in chain-mail armour glittering in the moonlight, the glitter in the present case being due to the frost on their coats and hoods.

Yet all interest of a sentimental or poetic cast yielded to the terrible announcement that a large pack of wolves was advancing from the north, though

how they knew this, or how the gendarmes knew of the approach of the Ostiaks, Frau von Steinfeldt never learnt. Having given this unwelcome news, the wanderers of the desert moved on, leaving our party in no very enviable frame of mind. Our friend the sergeant came up and, touching his forehead with his hand in military wise, said,

"Your Serene Highness need not fear, but when morning dawns we shall have to fire shots, but there will be no shots from the enemy's side. All you have to do is to calm the terrors of the suffering princess, and if possible keep her without any knowledge of the real cause. Perhaps the young knyaz may like to have a pop at a wolf, in which case I will give him a horse-pistol."

"Oh!" cried Ivan, "you are very kind, but I have my own. You don't think I should travel through Siberia unarmed!"

"That is the pure blood that spoke there," said the sergeant. "But I cannot do better than leave you in the sledge with your mother. After all, the wolves may come near enough for you to pop at them. If it should be so, aim at the eye or breast. Ah! here they come."

There was nothing to be seen. Not a trace of change in the surroundings announced to the lady and boy the approach of the dreaded foe; but the cavalry sergeant saw that his horses were uneasy. Quick as thought his men had

dismounted. Another moment sufficed to disengage the horses from the sledges. Hay from the extra sledge was thrown in a circle round the covered sledge, before and beside which the other sledges were arranged as outworks to protect the horses and to keep the wolves from the principal vehicle. All the sledge-horses were now arranged with their noses to the hay and their heels to the expected attack. There were four sledges, with three horses each, making twelve horses in all, which, added to the seven horses of the gendarmes, made up a total of nineteen horses all told.

In travelling over snow Russians are provided with immense boots of felt reaching up to the thigh, and made without seam. These boots have very thick felt soles sewn on to them, and when they are drawn on *over other boots* the wearer is guaranteed against the passage of snow, cold, or water to his person. Sergeant Gabrielloff ordered his men to dismount and place their horses amongst the others in the ring. This command was soon obeyed. The four drivers were ordered to keep within the circle, and to amuse the horses by giving them hay and talking to them. The soldiers were habited in the long felt boots of which we have been speaking, which had been smeared with a very odoriferous kind of tallow, rendering the snow of none effect as an enemy. Consequently, when stout Gabrielloff ordered his men to dismount there was no fear of any evil consequences. They dismounted accordingly, and helped the yamschiks to soothe the now almost unruly horses. Discipline is a wonderful tamer, and the horses, accustomed to their riders' voices, were soon brought to stand calmly while their riders arranged the circular formation in which the animals had to stand.

As soon as this result was brought about the men were ordered to mount *reversed*—that is, with the face to the tail! In this strange position, then, with carbine bent, pistols loosened in the holsters (now *behind* them), and each man with all the chambers in his revolver loaded, the troopers awaited the attack.

And very soon, as Macaulay says, "the low howling of the wolves is heard amidst the snow!" The horses are seized with a fit of trembling and strive to break the rings, and here the wisdom of placing the drivers in the midst became evident. Without their soothing and encouraging address the animals, despite the fact that the ring formation is so natural to them that they adopt it themselves against their enemies without the intervention of man, some would have burst all bonds and sought their own safety in flight. But the drivers were equal to the occasion. They had been liberally paid and kindly treated, and they knew that when their work was done they would be better off than ever; so that it was very much to their interest to behave well.

At last the wolves came in sight and neared the circle rapidly. The drivers exerted themselves to the utmost, the soldiers sat like statues, but their unwonted position seemed to add to the terror of their horses. At last the wolves came on, near enough for the gendarmes to fire. The sergeant sat in that part of the circle exposed to the first attack of the wolves. He was calm and very resolute. It seemed as though he thought those

terrific moustaches formed a barrier over which no amount of wolves would ever pass.

On came the savage brutes at the horrid sling-trot which never fatigues the animal like a stretching run or a violent charge. On they came. Seeing clearly that he had to deal with a very large pack, Gabrielloff rapidly ordered the troopers in that half of the circle which would be farthest from the attack of the wolves to dismount and join the others, mounting the sledge-horses and leaving their own. By the time this was done the wolves had advanced near enough for the men to fire with effect.

The word was given, and the carbines were all discharged with deadly aim. Seven wolves rolled over, struck by the heavy bullets of the troopers. The work of reloading was the work of a minute, and six more wolves "rolled over." Still they came on. Another volley was equally destructive and brought them to a stand. The firing had rendered the sledge-horses almost wild, but it calmed the horses of the troopers, and this aided the dismounted drivers in their efforts to soothe their own.

After a momentary pause the wolves came close enough for pistol practice. This the soldiers hugely enjoyed, and being so near the flash, the wolves were frightened. Some of the foremost turned tail and fled, to be attacked by their own race for their cowardice. Still the great pack came on. The men were now reduced to their revolvers, which were discharged with less effect than the big horse-pistols. On came the enemy, abandoning the sling-trot and rushing at the horses. And here the wisdom of Gabrielloff's disposition made itself apparent, for as the wolves approached, their rush was met with a volley of kicks from the hind hoofs of the horses that laid many of them low. This gave the soldiers time to reload and fire another volley from the larger pistols, which seemed greatly to disconcert the enemy, many of whom started off at a decidedly brisk pace over the snow.

Ivan was watching the conflict through the leathern curtain of the hood of the sledge, which he had drawn aside to permit of his seeing the fray. Suddenly there was a scream from Frau von Steinfeldt. Ivan turned and encountered the horrible face of a wolf whose head was just being thrust into the carriage. Quick as thought Ivan turned his revolver on him, and the beast, with "hideous howl," rolled over dead into the snow. But the incident alarmed both him and the lady, and they threw back the curtain of the hood to be more on their guard. This action revealed to them two others, who, escaping the shower of kicks from the hoofs of the horses' hind legs, had crawled into the circle to attack the sledges.

Gabrielloff's disposition of his forces was perfect. The three sledges formed an excellent barricade, so that if any wolves, escaping from the soldiers' fire, and remaining uninjured by the kicks of the horses (which seemed to be equally deadly in their effects), should penetrate to this inner part of the fortress, they would still be unable to attack the precious ones in whose defence the whole plan was arranged, without first having to tear down the protecting sledges, which had been well lashed together by the ropes and strengthened by the poles

originally brought to construct tents with. Before the monsters in their fury could break through all this opposition to their progress, there were plenty of chances of getting shots at them. How the wolf which Ivan shot contrived to get so far unseen was never known. But the two who succeeded him in the attack upon the interior had not even so much good fortune as he. They rushed at the barricade, where they were repulsed by the ropes and poles, and slinking round to gain the front of the centre sledge, were seen by Ivan.

It is wonderful what men—ay, and women too—can do under circumstances when it would be natural to think they would be too excited or too frightened to do anything. Frau von Steinfeldt coolly took her aim and sent a bullet through the eye of a wolf, which rolled over as Ivan's had done.

The attack of the wolves was far more furious than is usually the case with these monsters. They are generally afraid of fire, and do not attack many men. Probably the prime condition of the horses attracted them, for they could not have scented the provisions, as the milk was hanging in frozen lumps, and about twenty large frozen meat pies were hanging also from the roof. Hams, pieces of beef, joints of mutton, many large fish, were stored there, but being all frozen emitted but little scent. Besides these were small barrels of caviare, plenty of marmalade (which is in great request in Siberia), quantities of white bread cut in slices and buttered to keep it soft; tea, sugar, coffee, and other things which could have had no charms for the wolves. Whatever may have been the reason of this terrific attack, it was successfully repelled, and, as the sergeant subsequently remarked, "without loss on his side!"

It has taken some time to describe the actual attack of the wolves, but in reality the whole battle was short and sharp. The brutes, discomfited by the kicks which they had received from the horses, annoyed by the constant fire from the soldiers, at last turned tail, leaving a great number dead upon the field of Mars. The remainder withdrew, and were escaping in the same careless sling-trot in which they had advanced, when they were greeted with a rattling fire from the carbines in the rear. The horses had become almost unmanageable through fear, and it was the highest time to release them from their "ring fence." Accordingly the four drivers led off their trembling animals in a direction opposite to that taken by the wolves. Fortunately the intense frost held the snow firm, so that the poor beasts did not sink very low into the white covering of the ground, often found to be so fatally treacherous. The cavalry horses, accustomed to discipline, soon "fell in," when Gabrielloff "formed" them, and in a few minutes a regular pursuit of the surviving wolves commenced, but was soon relinquished from the uncertain nature of the ground, though not until about eight had dropped beneath the fire of the carbines.

On his return to the encampment the wary sergeant ordered the sledges to be prepared for immediate departure, and very shortly everything was in marching order once more.

"You ought to be a general, sergeant!" said the lady to her escort.

"It would be pleasant as to the pay, but not as to the work. A general does not see so much of his men as a sergeant does. I am pleased with my fellows on the whole, but we ought to have shot more wolves. I have a particular reason to hate wolves. They sent my mother mad!"

"Pray tell me the story, sergeant!"

"Not now, your Serene Highness, we must push on now for Trabsk, for there is snow coming if I am not much mistaken."

The same marching order was adopted that we have described already, and the little party reached the village described by the sergeant in perfect safety on the evening of the day that rose on the defeat of the wolves.

The miserable inn was a building in two parts, one on one side of the entrance hall or passage, and the other on the other. The division to the left was devoted to the accommodation of the family of the owner, and the other, a large oblong room, to that of the guests. The floor, like all floors in Russia, save in very wealthy houses, was bare. The furniture consisted of a large deal table, the stove, and some forms beside a large low shelf for a "bed." On the walls were several cheap and very gaudily-coloured prints representing scenes in the lives of saints. In the south-eastern corner was the Icon, or sacred picture, before which each guest is expected to cross himself. And now Frau von Steinfeldt arranged her plan.

"Sergeant," she said, "I must have a place screened off for me in the corner where the bedstead is. Let the men bring the canvas for the tents and make a partition there as quickly as possible. Then let the feather beds be brought out from the sledge and arranged behind the screen, while in front we have the provisions unpacked."

To the people of the house this desire to avoid publicity seemed strange, but the letters demanding assistance in the name of the emperor, coupled with the sergeant's assurance that the pay was princely, silenced all opposition. The troopers soon constructed a screen, the actual object of which was to allow of Ivan's appearing sometimes as Olga and sometimes as Ivan. *One of the children was always behind it.*

The night's rest was secured without any impertinent questions being asked, but the next day the sergeant announced the impossibility of proceeding on the journey on account of the snow, which was now falling in immense quantities, so as to render it impossible for the horses to see and for the men to find the way. This was unpleasant, but they were halfway to Tiumen, and so Madame Steinfeldt was not anxious until she found that the snow was likely to continue another day. However, she made the best of it, and took the opportunity to ask the sergeant how it was that his mother was driven mad by wolves. She asked him to sit down while telling the story, but this he said could not be done, so he stood like a column of iron while he told his tale thus:

"It is nearly fifty years ago, your Serene Highness. I was the youngest of a family of four. My father was sergeant-major, and his regiment was at Tiumen. I was a boy of six years old, strong and hearty, and not a great favourite with my mother, whose chief

delight was in her two younger children, of the ages of one year and two years respectively. Now it happened that the colonel commanding the regiment had somehow been suspected of applying the funds of the regiment to his own private purposes, and certain circumstances were brought forward to prove that he, with a certain Major Strogonoff, had together committed peculations to a large amount while the regiment was under command of a Colonel Brilloff the preceding year. The colonel was perfectly innocent, and declared that Colonel Brilloff could prove if he liked that he was not with the regiment at all during the period. This Colonel Brilloff had been, at the time of which I speak, advanced to the rank of major-general, and was at Ekaterineburg while we were at Tiumen. To reach him seemed impossible. Soldiers were then not permitted to travel, and the enraged general at Tiumen would allow no officers to quit the garrison, for he said he had no right to give special leave of absence for nonsense. At last the officers of the regiment petitioned for a month's delay in executing the sentence of disgrace and banishment to the mines for life, which sentence had actually been passed upon their colonel. Then arose the question, Who would go to Ekaterineburg and give a letter to the general? The civilians were indifferent, and the soldiers were not allowed to go. What was to be done?

"Now, my mother and father were very poor. The parents of my mother had objected to the match, but had given their consent at the express desire of the colonel, who advanced my father and furnished his little quartier for him in a very handsome way for our ideas, and gave my mother a dowry of one hundred roubles. Of course my father was ready to die for his colonel, but could not leave the regiment. And so my mother determined to brave the journey and put a letter into the hands of the general at Ekaterineburg. All the whole regiment, officers and men, liked both my father and my mother, so they were quite wild about the expedition. They got a troika sledge for her with provisions and everything, and off she set, as brave as a lion. Only she would not listen to the advice of her friends to leave her two babies at home behind her. No, she never had trusted her children out of her sight, and she never would do so; they were *her* children, and she would not part with them; but as for me, I was my father's favourite, and would be all right. So she departed on her errand of mercy.

"Nothing very important took place until the second day of her journey from Tiumen. This place was not built then, and it must have been hereabouts that she was attacked by wolves. The driver was frightened, so were the horses. They dashed along at a fearful pace, and the horrid wolves in full cry after her. At last she threw out some provisions, which delayed the whole pack, for those who seized the food were at once worried by their comrades to give it up, and so the row was fearful. But it was soon over, and the wolves were again in full pursuit of their human prey. Again my mother flung out food, and again was the pursuit stayed. Your Serene Highness has honoured the wolves by listening to their music; you may imagine how it sounded to one poor defenceless woman with her two babes. On sped

the sledge, but the wolves soon overtook it, and now articles of covering and clothing were thrown out to stop them in their course; then there was nothing more to throw. The wolves were gaining ground. What was to be done? Fancy the horror in that poor woman's soul. If she lost her life that was nothing, of course, but the colonel would not be saved from worse than death, the whole regiment would be disheartened, the officers insulted, and the men enraged perhaps to disloyal acts. And then what loss of blood would follow! Besides, did not she owe her happiness to the colonel? To him she owed her husband and the very bread she ate. To let him rot in a quicksilver mine, to let a stain be cast on the regiment, no! It must be done—there was nothing to be thrown out but the children—one was flung out—it stopped the wolves. It was a new morsel for them, and their fighting, howling, shrieking over the mutilated body of her child rang in the mother's ears! An hour was gained by this awful deed, but at the end of that time they came on again, and—Why should I harrow your feelings? The second child went! My mother arrived at Ekaterineburg, saw the general, gave the letter. He never noticed anything strange, but he ordered a large sledge well lined with fur to be got ready, and he ordered Cossacks to attend him. He had been promoted to full general now, but he made my mother sit by his side, and they travelled back as fast as the swiftest horses in Russia could take them. They reached Tiumen without accident, and the general fully proved that our colonel was perfectly innocent. He reprimanded the other officer, who had been too quick about his displeasure with the colonel, and he was afterwards disgraced. But my poor mother! she went home alone, caught sight of me, and flew at me as if she were a wolf. They got me out of her arms, but she died soon after raving mad. That is my wolf-story, and it is not a pretty one, but it's true, and you see why I like to shoot wolves—when I can!"

The soldier drew himself up, saluted mutely, faced round, and was gone.

The whole of that and the following day were passed in watching the snow as it fell in thick flakes, hiding the village, as it were, with white fur; and, indeed, the warm covering contributed greatly to the comfort of the dwellers in that part of the world. At last the snow-cloud cleared, and the blue sky shone over the white shroud that lay upon the body of dead nature. Then Gabrielloff appeared and announced that it was time to depart, that he had hired guides with snowshoes to conduct them on their way, and to assist in transporting the sick princess to her bed in the sledge; to which Frau von Steinfeldt consented. She told him to return in half an hour, during which interval Ivan slipped on the skirt over his dress, assumed the girl's schuba and bashlik, and was as pretty a little girl as could be imagined. On account of the long skirt and other portions of female dress, he looked much taller than he did in his boy's costume. His great difficulty was to keep from laughing, for everything tickled his sense of fun so immensely. However, he reached the sledge in safety, and Frau von Steinfeldt dismissed the faithful sergeant to look after the packing of the

provisions that were yet to last the whole party two days. While he was thus absent Ivan shuffled off his feminine attire, and was "himself again." He assumed his schuba, fur cap, boy's bashlik, and over-boots, and when the sergeant returned he found our hero patting the horses quite coolly.

At last they "got under way" again, and off they sped through the steppe, carefully led by their guides in the snowshoes, who skimmed along the surface of the snow much as a skater flies over the ice. In fact the horses could not keep

partially; when entirely lost the man is in fact an outlaw, if he be killed it does not matter, nobody cares. If he were a noble he loses all nobility, whether hereditary or merely arising from his tchin or rank in the service. He has no wife, for the loss of his entire right includes the rupture of the marriage tie. His children are absolved from all obedience to him. He is dead to the community for ever. He cannot sign his name to a letter, as his name is lost with his other *prav*. That is to say, his surname is lost, though he retains the bap-

swords, but they are permitted to take money bestowed upon them by charitable people who may be moved to compassion on seeing them march with their irons clanking as they go. No person can tell the sad feeling caused by seeing such a train of convicts leave Moscow or any other great town to take the dreary march to Siberia. Many a time had Frau von Steinfeldt in her youth witnessed the passage through Moscow of such gangs, but never had it occurred to her that the tender plant, her own beloved niece, would ever be forced to wear that hated

"Still the great pack came on."

up with them on account of constant sinking in the new-fallen snow, which was not yet of sufficient solidity to form a road.

However, at the end of the second day from their departure from Trabsk they arrived at Tiumen. Although Ekaterineburg may be considered, politically speaking, as the first Siberian town, the actual frontier is much farther north and east, lying between Ekaterineburg and Tiumen, much farther, in fact, than the requirements of our tale allowed us to place it. But Tiumen is in Siberia proper, and affords the traveller the very best means of ascertaining what is being done, or what is going to be done to the prisoners, who are from hence distributed to the various places of punishment. Some are declared to have forfeited their *prav* or rights as citizens. This *prav* may be lost entirely or only

tismal appellation. Instead of a surname he obtains a number. Thus such a person originally called Prince Ivan Ivanovitch Zaklistoff would lose the prince, the Ivanovitch, and the Zaklistoff of his name, and dwindle down to Ivan No. 1,222,333,444, or whatever it may be. This is quite enough to quench the light of life in most men's minds. Such a prisoner can have no property, is forced to wear the prisoner's dress, and to have the head partially shaved.

Both men and women are subject to corporal punishment of the severest kind, and when let out of prison for good behaviour, or allowed to do something for themselves as settlers or domestic servants to settlers, they are at any moment liable to be ordered back to prison by a governor. They march into Siberia in great gangs of convicts accompanied by police-guards with drawn

dress, or be driven along the road like a beast to a market.

When the town of Tiumen "came in sight," as the sailors say, Frau von Steinfeldt's heart beat high with mingled fear and hope. The gilded domes and crosses were fewer than in most Russian towns, but after the paltry accommodation of the villages and towns they had hitherto seen, it seemed to promise great things to the now weary travellers to get into a town that was at all worthy the name.

As her sledges drove through the gate, and the gendarmes rode by their side, the first idea of the sentries seemed to be that a winter gang of criminals had arrived. The two mounted soldiers sent on before, however, soon corrected this impression, and the sentries presented arms as to a member of the Imperial family as our friends entered the town.

(To be continued.)

TOM STANTON: A STORY OF COUNTRY LIFE.

CHAPTER III.

PALE and unrefreshed Tom awoke the next morning. His whole hand was swollen and throbbing, but after putting some plaster on his finger he managed to get through breakfast without exciting remark. The boys found him dull and languid, and after a time he left them to their rough play, and going to the moat, sat down with

his hand resting in the water, the coolness of which gave him a little ease.

After a time Jack's terrier trotted up. Always a little distrustful of the new arrival, he did not venture to approach, but stood at a respectful distance.

Something in the dog's attitude irritated Tom's easily roused temper, and reaching for a stone from the gravel path beside him, he sent it after the little animal, who was rapidly disappearing behind some bushes. The stone had hit something, it was evident, but that sound was not the yelp of a dog. Peeping

cautiously round the bushes, as if apprehensive of another missile, appeared the figure of a stoutly built boy of about Tom's own height, who was carrying a large basket. Slowly he came down the path and stood still at a little distance, as though waiting to be addressed.

Looking up with the haughty air with which he spoke to all beneath him, Tom asked, "Was it you who cried out?"

"Yes, sir, your stone hit me on the shoulder."

"Oh, well, it wasn't meant for you. I didn't see that any one was there."

"No, sir. 'Twere meant for Mr. Jack's dog, I know."

"Well, it didn't touch him, so you needn't run and tell Mr. Jack. And look, here's a sixpence for you."

"Thank you, sir, all the same; but I don't want the money."

"Nonsense! Here, catch. Who are you, and what's your name?"

"I am Sam Easton, sir, the gardener's son. I live at the lodge."

"Oh, I say, tell me, have you ever been bitten?"

"By a dog, sir?"

"Lifting the dog, he tossed him into the tree."

"By anything. It's all the same, I suppose."

"No, I haven't, sir; but one often hears tell of people being bitten by dogs, and rats, and such like."

"Well, what do they do for it?"

"Oh, a-many things. If a doctor's handy he'll put something on, or a smith will burn it with a hot iron; but I have heard old Mother Pringle say as the sovereignest remedy of all is— But I needn't tell you about that, sir."

"Yes, go on."

"She did say that if a man got an animal—one as goes on four legs, she said—and named it after the one that bit him, and cut a bit of hair off it to scatter to the four winds, and then shut that animal up without food till it was dead, that just as fast as the creature pined away so the man's wound would dwindle with it, till at last he was cured and healed and all danger was past."

"Do you think that is true?"

"I don't know, sir. Father he can't abide the old woman. He says years ago, before people knew better, she would have been burned for a witch, and bids me not to go nigh her."

"I thought there were no more witches now."

"Not real ones, I suppose there ain't; but— There's the rector, sir, saying good-bye to the master. I must be going."

"No, stop a minute, Sam, I want to hear some more. They used to tell me things like this in India, but I didn't know it would be the same in England."

"Yes, sir; but for all Mother Pringle's queer ways folks go to her; for she is clever with herbs, and can make a cure—aye—quicker than the doctor sometimes. If all's true that I've heard, it's likely she'll soon have enough to do, for—"

"Ah! Tom, is that you?" said the voice of Mr. Stanton close by, making both the boys look quickly round. "Where are the others? I wanted to tell you all that for the present I wish you to keep out of the village. The rector has been telling me that there is a good deal of sickness there now, and it is better not to run the risk of infection. Tell your father what I say, Sam," he added, turning to the boy, who was taking up his basket. "For a time you had better not go into the village shops. I suppose you have been down there now?"

"Yes, sir; I had some errands to do for father."

"Ah! Well, he will manage differently when he hears what I have said. Go now and tell him; and when you see the boys, Tom, don't forget my message," said Mr. Stanton, continuing his way to the stables.

A little time longer Tom sat where he was, letting the cool water trickle through his fingers, and apparently thinking deeply. Then he got up, and with his eyes fixed on the ground, went slowly to find his cousins.

It was soon after lunch on the same day. For a wonder even the boys seemed subdued by the heat, and were lying about the cool morning-room in attitudes more comfortable than graceful. Jack and Tom, who often differed in opinion, had just begun a mild argument, when the roll of carriage wheels announced a visitor.

"Who is it?" cried Jack, jumping up. "I'm off, or we shall have to go in. Bertie,

whip up the back stairs, and run round and spy into the hall. They won't see you if you look through the banisters. I know what being called in to see visitors means; mother is sure to say afterwards, 'You might have brushed your hair, dear!' Well, who is it?"

"All right," said Bertie, grinning; "it's old Mr. Harrington. I'm going in."

"So am I," said Jack, promptly leaving the room.

"It's Jack's godfather," Bertie stayed to explain; "and he always gives us both a tip when he calls. Won't you come in too?"

"No—why? I don't know him," answered Tom. "I shall go out, I think."

Getting his hat, he stepped out of the low window and looked cautiously round. All that side of the house lay in shade. It was the servants' dinner-hour, and no one was to be seen about. Only Snap, Jack's terrier, lay stretched on the cool grass fast asleep. Bending down, Tom patted the dog gently, and then, taking out his handkerchief, he knotted one end into the leather collar.

"Hie up, boy! come for a race?" he said; and leading the terrier by the handkerchief, he turned into a narrow path, and ran down it on the way to the park. It was hot after leaving the shade of the shrubbery, but Tom ran on, for he had some distance to go, and not much time to do it in. How the sun did blaze, and how the heat made his hand throb and ache! His finger seemed to be getting worse instead of better, and it was quite time that he should do something to cure it. There, at last, he could see the tree where he had met Bart. With its few branches standing out against the sky, the old oak stood apart, lonely and desolate in its decay.

Arrived underneath the tree, Tom did not pause an instant for thought, but lifting the old dog from the ground, he tossed him up in the air, so that he fell down the hollow trunk with a yelping cry. A whimpering sound followed, but the boy did not stay to listen. With a beating heart, but with sullen determination, he hurried away and retraced his steps as quickly as he had come. After all, it was only a dog—quite an old, stupid dog—and Jack would not mind much about it after the first. Let it bark as it might, no one was likely to hear it there; and why should any one suspect that he could know what had become of the dog?

Crimson and panting, he regained the shrubbery. It would never do to be seen like that; a turn among the trees might cool him. Seeking a retired spot, made almost gloomy by the shade of evergreen shrubs, Tom sat down to rest. But soon a feeling of anxiety as to the result of what he had just done began to oppress him, and vague terrors such as he had never known before weighed down his spirits. Impatiently he sprang to his feet. His hand was unbearably painful. Up in his own room he could bathe it, and perhaps get the burning out of it.

A night of pain put Tom's fortitude to the test, and in the morning all concealment was at an end, for his hand and arm were so swollen that they would not go into the sleeve of his jacket. In spite of his fears of discovery, it was almost a relief to think that at last something might be done to relieve him, for as yet the old woman's charm had had no effect.

Idly he sat on the side of his bed, wondering what would happen, and what he should say if questioned, until Jack came in on his way downstairs to see if Tom were ready.

Exclaiming with surprise and dismay at the sight of the swollen hand, Jack ran off to tell his mother, and soon poor Tom found himself being tended with a gentle, pitying care, which made him wonder why he had feared so much to have his hurt discovered. He was glad to lie down and rest until the doctor came, for he felt faint and ill, and while he kept his eyes closed, and appeared to sleep, at any rate he could not be questioned; and soon the exhaustion of pain brought on a heavy slumber, from which Tom only awoke to find his uncle and aunt beside him with a stranger.

"I blame myself," Mr. Stanton was saying, "for not having seen sooner that something was the matter with the boy; but he made no complaint of the pain which he must have suffered, and has behaved like a little hero."

"A cut with a knife, did you say?" asked the doctor, who had put Tom's hand into a basin of warm water to remove the plaster which the boy had applied so unskillfully.

"Yes, done two or three days ago," replied Mr. Stanton, while Tom watched the doctor silently.

The plaster was slowly coming off, and disclosed a wound, at which Mrs. Stanton exclaimed, while the doctor shook his head.

"This is not a cut," he said, looking at Tom, who had his eyes fixed on the ground. "This is the bite of some sharp-toothed animal," continued the doctor, after a pause; but still Tom neither looked up nor answered.

Mrs. Stanton would have spoken, but, holding up his hand to restrain her, the doctor turned to Tom, and, putting his hand on his shoulder, said, "Come, my boy, let us hear all about this business."

For a few moments there was silence. In the confusion of his thoughts only one thing was clear to Tom—that he must devise some excuse which might account for his former silence without leading to the discovery of that which he had borne so much to conceal.

Clearing the sulen look from his brow, he looked quickly up at the faces round him, and said, dropping his eyes again, "I did it to save Jack."

"Jack! What of him?—what had he to do with it?" asked Mr. and Mrs. Stanton together.

"It was his dog," said Tom, as if with reluctance.

"Did Snap bite you?" cried Mrs. Stanton, in evident alarm.

"Yes; it was that day when I was out alone. I was not thinking of the dog, and just near the house I bent to pick up a stick, and I suppose Snap thought I was going to hit him with it, for he flew out suddenly and bit me here on the finger."

"But why didn't you tell us, Tom, at once? Such things should never be concealed," said his uncle.

"I was afraid," mumbled Tom, "that Jack would lose his dog, and he is so fond of him."

"It was kind of you, my boy, but I am very sorry all the same. Doctor, will you come and speak to me when you have done here?" said Mr. Stanton, leaving the room hurriedly.

Mrs. Stanton said nothing, but Tom could see the tears in her eyes as she quietly gave the doctor the assistance he needed. Drawing a deep sigh of relief, Tom wondered if his ready tongue had saved him once more, and tried to think that there was nothing so very wrong in this network of lies with which he was surrounding himself.

"It won't do any one any harm," he thought; "the dog is gone already, and it is better Jack should think that Snap was to blame than that my uncle should tell my father things that would vex him about me. When this is all over I'll take care not to do anything that is forbidden again, and—and I must try to make it up to Jack somehow, if I can."

That was a dull day for Tom. The doctor said he had better be kept quiet, so the boys were not allowed to go near him. Only towards evening Bertie got leave to go and see him for a few minutes, and crept softly into the room as if he expected to find his cousin at the point of death. He seemed relieved when Tom spoke to him as usual, and, sitting down, was soon retailing the events of the day.

"Jack is in an awful state," he said. "Snap can't be found, you know, and now James says that he never came for his supper last night as usual. It is so odd what can have become of him. He seemed all right when I saw him last, and he can't have been stolen, for he

would never let a stranger touch him, and besides, he isn't worth anything now."

So Bertie chatted on, until, finding that Tom was lying with closed eyes, and did not answer, he got up, and, saying he was afraid that he was tiring his cousin, wished him good night, and left the room.

Tired Tom was, but only with uneasy thoughts. Again and again he went over all the chances of his being found out, and even when sleep closed his heavy eyes, feverish dreams renewed the terrors of the day.

(To be continued.)

ON SPECIAL SERVICE: A NAVAL STORY.

BY GORDON STABLES, M.D., R.N.,

Author of "The Cruise of the Snowbird," "Stanley O'Grahame," etc.

CHAPTER X.—CAPTURE OF A PORTUGUESE SLAVER—MAKING IT "COMFORTABLE" FOR THE CREW.

NEXT morning broke bright and fair, the sea was all that suits a sailor's fancy, the breeze strong and bracing, and every inch of canvas set.

It was found that steam did not help the Theodora along, or was not needed, so fires were banked.

It was provoking, though, for yonder was the strange sail—the phantom ship, as she came now to be called—miles and miles away to windward of them. There was no getting up to her.

The excitement on board the Theodora now increased rather than abated.

About nine o'clock, and just after divisions, the captain himself came on deck. He called Benbow, and, chaffing him, asked where the fleetness of the Theodora had flown to?

"Yonder is the chase," he said, "and chase she is likely to remain, Benbow. She is walking away from us. She has the heels of us, and she knows it."

"A wild-goose chase, I should say," put in M'Gee.

"I don't think," said Lieutenant Gayly, somewhat contemptuously, "that a surgeon has any right to put in his oar in matters strictly connected with the working and management of the ship. Pills are more in your way, Dr. M'Gee."

"Man," said M'Gee, "I would think now that a few of those same pills would do you good. It would help to take some of that gall out of your blood. There are just ten on the sick-list this morning," he continued, turning round and saluting the captain.

"Thank you, doctor," replied Captain Blunderbore.

But the doctor did not retire immediately. He owed Mr. Gayly one, and he meant to let him have it.

"I think, sir," he said presently to the captain, "it would be the correct thing to put Mr. Gayly on the list."

"On the sick-list?" said the captain. "Why, doctor, what makes you think so? Nothing wrong with my second lieutenant, I trust?"

"Indeed, sir, I fear there is."

Gayly was standing with one hand on the bulwark, looking as pleasant as a badger in a soda-tub.

"I fear, sir—indeed I am sure—he is suffering from blood-poisoning."

The captain gazed anxiously towards Gayly, and, thinking he had gone far enough, M'Gee hastened to complete his explanation.

"He laces too tightly, sir. Horrid thing, tight lacing! Gives his liver no play. Drives the bile all through the blood."

Captain Blunderbore laughed, and Benbow joined heartily, and even the man at the wheel, who had heard all, took the liberty of smiling. Gayly grew red, then white, and bit his lips and lowered his brow, but that did not affect M'Gee in the least. That officer simply nodded and smiled to him, lifted his cap to the captain, and retired with his sick-list under his arm.

"Yes," said the captain, resuming his conversation with Benbow, "I want to know where all the Theodora's fleetness has flown to."

"That ship," said Benbow, shaking his fist towards her—"well there, I won't use strong language. I think, though," he said, "we might carry more sail."

"Oh, by all means set it, then; only don't tear the sticks out of her."

Benbow and Gayly consulted together. Then orders were given. The boatswain's pipe screamed and bubbled right merrily in the morning air, reefs were shaken out, and an additional fore and aft sail or two clapped on.

The Theodora felt it. She seemed to awake and shake herself into newness of life, and in a few minutes it was evident from even the swirl of the water and the fast retreating foam alongside that she was moving far more swiftly through the water. The race had commenced in earnest.

Mr. Gayly ordered the log to be heaved. Shortly after Benbow once more advanced to where the captain stood, glass in hand, gazing steadily at the chase.

"She'll do," cried Benbow—"she'll do yet! We're knocking two more knots out of her. I told you she could do it!" and the sailing-master rubbed his hands with glee.

"One thing to me is pretty evident

Mr. Benbow," said Captain Blunderbore: "yonder ship is a clipper, and as long as the wind holds she can beat us; and as the wind will hold for days and days, we'll lose her."

"Think so, sir?"

"Think so! yes. Do you, Mr. Benbow, imagine that if she didn't know her own speed, and guessed at ours, she wouldn't have extinguished her lights last night and tried to give us the slip in the dark?"

"Well, yes; there is something in it."

"But," continued Benbow, "my glass tells me that we are even now gaining on her."

"And mine says nothing of the sort. Come up to the bridge, Mr. Benbow."

"Now, then, what says your glass?"

"Why—why—I declare they are clapping on more sail!"

"Yes; and so we may say good-bye to them."

"But see, sir—see how she yaws! There is something wrong there—something strange going on!"

"Ay, that there is!" said the captain. "The sail doesn't go up quickly. Down it goes again!"

"There is a row yonder, sir, depend upon it."

"Mr. Gayly," cried Captain Blunderbore, "clear away the pivot gun, and get ready to fire!"

The pivot gun was a sixty-pound chaser, a somewhat ancient-looking Mons Meg of a thing that lay forward between the bows like some huge monster of an antediluvian type waiting for its prey.

She was speedily loaded, and the men stood by to open the bow ports or bulwarks.

"We are gaining on her now," said Benbow; "and it gets more and more evident every moment there is something up on board of her."

"Look! yon was a puff of smoke, as if a pistol had been fired. Another, and still another!"

The strange vessel now appeared but badly managed, and there was no attempt to make more sail.

Presently her sails shivered; then round came the yards. She was aback.

Then a larger puff of smoke rose from about her quarter-deck, and soon after across the water came the quavering roar of a heavy piece of artillery.

"That's mutiny," said Captain Blunderbore. "Civil war on shipboard."

Captain Blunderbore. "A little closer, Mr. Gayly."

"Shall we hit her, sir? Mr. Barclay can do it." Mr. Barclay was the gunner.

"No," replied the captain, smiling, but shaking his head. "We must not hit

forth from the bows of the Theodora, and a shot went crashing through the rigging of the strange barque.

She had evidently imagined that her flag would protect her.

That shot, however, had the desired

"They were received by the captain of the barque himself."

Meanwhile the Theodora gained on her hand over hand.

"Fire across her stern, Mr. Gayly."

The thunder of the great gun then rolled forth, the ship shook and reeled, and in a few minutes a balloon of white foam rose twenty yards astern of the chase, telling where the ball had struck the water.

But no visible effect was produced on board the strange sail. She had filled again, and was once more staggering on her way, with sheets awry and sails that sadly needed trimming.

"Go a little closer next time," said

her; if we can overhaul her without hitting her all the better for everybody."

"Look!" cried Colin, who was also on the bridge. "She has run up colours."

"Can you make them out, Mr. McLeod?" asked the captain. "Your eyes are young."

Colin looked through his glass for a moment.

"It is the Spanish ensign, sir," he replied. "I caught sight of it this moment fairly afloat on the breeze."

"Yes," added Benbow, "that is the flag. Mr. McLeod is quite right, sir."

Once again smoke and fire belched

effect. The barque lay to, and the Theodora's boats, four in all, were at once called away.

The captain went in his own gig, Benbow had command of a boat, and Quentin and Colin commanded the others.

When within a hundred and twenty yards of the barque the Theodora was laid to, and away sprang the boats.

They expected no resistance, nor did they find any.

They were received at the side by the captain of the barque himself, a tall, dark, and very ill-favoured man, and with no very good grace either. He

saluted Captain Blunderbore; then, speaking quickly and almost fiercely, he demanded to know the reason of the Theodora's fire.

He spoke in Spanish, but Mr. Barclay, the gunner, a man who could speak almost any language, was one of the party, and acted as interpreter.

"You fire on me, the merchant captain of a friendly power!" cried the skipper of the mysterious barque. "I shall duly enter the occurrence in the log, and the Government of Spain shall demand apology and redress."

"My good fellow," returned Blunderbore, "pray restrain yourself. You showed no flag, and you ran away from us. We are here in these seas to protect British commerce and protect the coast. How do we know what or who you are? Behold, your decks are slippery with blood; several men lie dead and many wounded. What means the mystery?"

"*Sedicion—motin*," murmured the fellow.

"Mutiny," said Barclay.

"We guessed as much, and now you will kindly show your papers, and we will assist you."

"Assistance?" cried the Spanish captain. "We want none. I have already quelled the mutiny."

"We want no assistance," added several other cut-throat-looking fellows who stood near their captain. "The mutineers are now close under hatches."

"Then I'll have some of them up and question them," said Blunderbore. "Benbow, order your fellows to knock the hatches off."

The Spaniard issued some hurried order, and from the poop deck there instantly rushed out over twenty fully-armed men. At the same moment the muzzle of an ugly-looking nine-pounder was lowered over the poop itself.

Benbow and Blunderbore sprang at once back towards the gangway. One word from the latter and the British marines to the number of fifteen sprang on board.

"Fix bayonets," cried Blunderbore.

The marines obeyed as coolly as if on parade, and brought their rifles to the deck with a ring and a rattle that evidently had an effect upon the Spaniards. But the muzzle of that ugly nine-pounder still covered the men and officers of the Theodora.

"Resistance is useless," said Blunderbore, "if you mean to resist; you have not yet done so, nor have we exceeded our duty. Your explanations, however, must be most perfect and complete, or you are our prisoners. No mere merchant ship can show so many armed men. You will please produce your papers."

As the captain spoke the last words a loud crash was heard. A hatch had been burst open, and a tall gigantic negro sprang up and leapt on deck. The blood was streaming from a recent wound in his brow.

He looked a fearful apparition; his black almost naked form, on which the usual scars were visible on the chest, his powerful limbs and fierce eyes, and the determined attitude he assumed, made him indeed a formidable subject.

His appearance was the signal for a rush forward of the Spaniards. The marines' bayonets were at once levelled, and the foreigners staggered back again, scowling defiance as they went.

"They lie," cried the negro, in English—"they lie. Gentlemen of the British Navy, they lie. I see one Krooman. I hab served in de Navy. Dese men are not Spanish. Dey are Portugee. Dis is a Portugee ship. Ship am full, gentlemen, full to de hatches of slaves. See for yourselves."

Blunderbore spoke a few words in a low voice. He hardly moved his lips as he did so. Yet the effect was instantaneous.

The marines rushed on the armed crew with one ringing cheer, and in two minutes every man was disarmed, and Blunderbore had declared the barque a British prize.

The sailors and marines cheered once more, and back from the Theodora came a triple echo; and, looking over the bulwarks of the barque, one could see the British tars clustering on bulwarks and rigging, as they waved their caps and cheered.

The skipper of the slaver became very quiet now, and very humble indeed.

"I confess," he said, "to have been legally captured on the high seas."

"Taken red-handed, tell him, Mr. Barclay," said Captain Blunderbore.

"But," was the bold reply, "I have never drawn sword or levelled rifle against a British officer or man, or resisted, except by words, your attack upon me. I have not therefore forfeited my life, nor the lives of my crew."

"How well he seems to know the law," said Benbow, when this was interpreted.

"No," was the answer from Blunderbore, "you have not forfeited your life to us, but it will be our duty to hand you over to your own countrymen, and by their laws you will be tried for murder."

"Meanwhile, sir," said Benbow, "don't you think these wretched Portuguese fellows should exchange places with their still more wretched captives, who are still under hatches? A little of their own medicine will do them good."

The marines, drawn up there on the maindeck, felt mightily amused and pleased at Benbow's proposal, and they grinned to a man. Benbow was a great favourite with every one on board the Theodora. He had so much dash and go in him, so much life, but withal so much genuine humour, that there was no resisting him.

Captain Blunderbore was somewhat taken aback at this proposal.

"Really, Mr. Benbow. Yes—that is, no, you know; at least I must have time to think. This rascally crew must of course be made prisoners."

"And put in irons?" suggested Benbow.

"Well, yes, they resisted in a measure. Irons, though, Mr. Benbow, eh? Irons?"

"Certainly," said Benbow; "irons, sir, by all means."

"No ropes would hold these slippery eels," said Barclay, quietly. "They are all born Davenport Brothers."

"Besides, sir," continued Benbow, "irons are ever so much more wholesome. Dr. McGee will tell you that."

"Depends on the climate, gentlemen," said Barclay, shuffling shyly with his feet, as if he felt he was taking considerable liberty in talking thus with his superior officers, without having been invited to join the conversation. "Depends on the climate. In a ship I was in up in the Arctic regions, the captain

put a man in irons, and he was left all night in the cockpit. Next morning he was found lying on his back insensible-like, and the irons, sir, were frozen into his ankles. He lost both his feet and died afterwards."

"Died, did he?" said Captain Blunderbore. "Dear me, dear me! Poor fellow, poor fellow! Really, though, the best thing he could have done. Well, Mr. Benbow, as we can't have these scoundrels loose, you know, I think—it must be irons."

"And release the slaves and put them below?"

"Well, I suppose—it—must—be so."

"But," continued good, simple Blunderbore, who really had a kind heart of his own with all his little eccentricities, "make it as comfortable for them as the circumstances will admit of."

"Oh, yes; we'll make it comfortable for them. Just explain that to yonder scowling skipper, Barclay, will you?"

Barclay laughed.

"You lubberly [*cochino*] old son of a sea cook," he said, in Spanish, "we're going to make it hot for you! You'll have irons on your legs to keep them cool, and may be a yard or two of hemp [*cuerdo*] round your neck to wind up with!"

"I hope you're explaining to them, Mr. Barclay," said the captain, "that we do not mean to treat them with hardship, nor impose upon them further restraint than the exigencies of the occasion and the service demand."

"That is just what I'm doing," said Barclay, "and I think I've made it plain to them, sir."

"Now, Mr. Benbow, you can do your duty. Secure your men. The marines shall remain here with you. I shall send the doctor on board and some more men, and—the irons."

"And the irons, sir?" exclaimed Benbow. "Pray, sir, do not!"

"Eh! What?"

Benbow drew himself up to his full height, which was not a great stretch after all.

"There are irons on board, sir; slave irons," he said, boldly. "Those are good enough for ruffians such as these. What, sir, would we place British man-o'-war irons on the legs of Portuguese slave-traders? Perish the thought, sir! Could we, I ask you, sir, ever afterwards dare to put these same irons on the feet of our own decent blue-jackets? No, sir, the biggest scapegrace of a marine, the veriest bounty-jumper, would blush like a rose, sir, or a slice of beetroot, to don irons that once had graced the ankles of a base and cowardly dealer in human flesh."

There was a murmur of applause from the marines, and one of them, Davis to name, a fellow who was never sober when he had a chance of being the reverse, and who boasted that he had been thrice flogged in ten years, was heard to mutter, "Blowed if ever I'd care to wear those irons again."

"Well, well, well," said Blunderbore, "have your own way, Mr. Benbow. But, bless my heart, what a capital actor you'd have made."

And off went the captain in his boat.

(To be continued.)

HEROES OF THE BACKWOODS.

V.—MYLES STANDISH.

AND now let us go back a few years and say a word or two of one whose story can never be told too often. Myles Standish, who headed the first exploring party of the Pilgrim Fathers, and to whom is mainly due the successful colonisation of New England, was a true "hero of the backwoods"—for the backwoods are simply the forests beyond the boundary of civilisation, and that boundary is being constantly driven back. In Standish's time it was on the seashore; to-day it is in the Far West.

Standish was born near Chorley in Lancashire in 1584, and—fortunately as it would seem for the world at large—was defrauded of his inheritance by some rascally relative. Amongst the curious associations of these latter days was the company formed in 1546 to recover the Standish estates and divide them amongst the famous captain's descendants—a company, however, which did little beyond clearing up the date of Myles's birth and realising the utter hopelessness of the task they had set themselves.

Standish, having seen service in the Low Countries as one of Elizabeth's captains, and married a wife from the Isle of Man, had settled at Leyden. Thither came the fugitives from Scrooby, fleeing for conscience' sake from the persecution of King James. With them came many other Englishmen from various parts of the country, and for a time a large Puritan colony settled in the old university town. It was only for a time, however. In a few years most of them resolved to leave Europe altogether, and seek their fortunes across the Atlantic, where religious liberty knew no restraint beyond what they should put upon it themselves.

The Speedwell, a small vessel of sixty tons, was purchased and brought round to Delft Haven. There was a solemn leave-taking. "The feast was at the pastor's house, which was large. Earnest were the prayers for each other, and mutual the pledges. With hymns, prayers, and the interchange of words of love and cheer, a few hours were passed." And then Leyden was left, and, after the short run by canal to Delft, the embarkation took place. It was the 22nd of July, 1620, when the Speedwell set sail bound to Southampton.

At Southampton she was being waited for by the Mayflower, a ship of double her tonnage, bought by emigrants from England, and on the 5th of August both vessels put to sea. They soon had to run into Dartmouth, the Speedwell proving leaky. Thence they started on the 21st, and again after a day or two they had to put back. This time they came to Plymouth, and there the Speedwell was abandoned, and thence the Mayflower set out alone on her world-famous voyage. On board were one hundred and two passengers, of whom forty-one were men. Among them were Myles Standish and his wife Rose.

The voyage was a stormy one. They had been sixty-three days out when they sighted Cape Cod. The Mayflower kept off for some time, and at last dropped anchor in the bay just past the white sand cliffs where Provincetown now stands. It was Saturday, 11th November, 1620. In the cabin of the Mayflower the pilgrims had already drawn up that scheme of government which was to prove the germ of the present constitution of the United States. John Carver was chosen governor for the year, and as soon as the anchor was down Captain Myles Standish was sent off with sixteen men to explore and report. They soon returned with the news that the district seemed sterile and unsuitable for a settlement.

After the Sunday spent in services, and Monday and Tuesday occupied in getting the shallop together, another visit was paid

to the shore. Standish and fifteen men in complete armour landed at Long Point and made their way by the coast. Six or seven Indians came in sight after they had gone about a mile, and precipitately fled.

Standish tried to catch them in vain. Night came on, and he encamped. Then he went on and found a spring, and then through a valley where were traces of deer he reached the little lake near Pond Village in Truro. Then he came across some Indian graves, discovered an iron kettle from some shipwrecked cargo, and halted to examine a mound, which proved his most important find. "In it we found a little old basket, full of fair Indian corn, and digged farther and found a fine, great new basket, full of very fair corn of this year, with some six-and-thirty goodly ears of corn, some yellow and some red, and others mixed with blue, which was a very goodly sight." The pilgrims had never seen maize before. They had lighted on an Indian barn. They filled the kettle, hung it on a stick so that two men might carry it, and took it back with them. Eight months afterwards they met the Indian owners and paid them "to their full content" for what they had taken.

On their way to the ship the explorers came upon a sort of trap, which Bradford was carefully examining when he released the catch, and found himself caught by the leg, snapped up, and dangled head downwards in the air. He was speedily set free, and the local deer-traps were avoided for the future. There are many more comfortable positions for a man in armour than to be dancing about in the air suspended by one leg to a strong young sapling.

The report given by Standish was not favourable, and the Mayflower made her way along the coast. At Great Meadow Creek, in Eastham, Standish and a party from the shallop came into collision with the natives. He had ten men with him. Five he left to guard the boat, and five he took to keep the barricade he had thrown up round his camp. The Indians attacked quite suddenly, and showered on the half-dozen Englishmen scores of bone and flint-headed arrows, which dropped harmlessly off their coats of mail. One Indian made himself conspicuous by voice and gesture, and shot arrow after arrow with wonderful strength and precision from behind a tree. Standish waited for him. The Indian's arm was exposed as he drew an arrow to the head to shoot. The captain fired and the shattered arm dropped helpless. "The savage gazed for a moment in apparent bewilderment and dismay upon the mangled and bleeding limb, and then, as if conscious that he had fought his last battle, uttered a peculiar and distressing cry, which was probably the signal for retreat, and dodging from tree to tree disappeared, his warriors following his example."

After a Sunday spent on Clark's Island the pilgrims continued their voyage, and on Friday, 11th December, the Mayflower dropped anchor in Plymouth Harbour, so named after the Plymouth whence she had sailed. She was not the first vessel to enter Plymouth Bay; years before our old friend Captain John Smith the Great had surveyed it when out on the voyage in which he gave the country the name of New England.

The settlement was formed and the land plotted out; and in March Samoset strode in with his "Welcome, Englishmen," which proved so astonishing. And indeed the sight of the naked savage walking fearlessly into their midst and addressing them in their own tongue was enough to cause alarm. The explanation of his friendship with the English fishermen at Monhegan was sufficiently reassuring, and Samoset proved of considerable service. Squanto followed, and with the

help of these two in their dealings with the natives the colonists increased in prosperity.

The district was gradually explored by Standish. A visit was paid to Massachusetts Bay, also previously mapped by Smith, and the pilgrims reached the three-crested peninsula of Shawmut, on which Boston now stands. Turning to the southwest they noticed the sharp contour of the arrow-headed Blue Hills, from the Indian name of which—Massachusetts—the State was afterwards to take its name. The land was so pleasant that "they wished they had settled here rather than at Plymouth." The Indians proved friendly, and when Squanto suggested that they should be plundered owing to their being generally "bad," Standish gave him his noble reply, "The Indians are never so bad for me to wrong them or give them just cause of complaint."

Meanwhile another party of settlers had landed at Weymouth and fallen into difficulties. An Indian conspiracy was formed to drive the white men back to the sea. Standish went off to Weymouth to arrange the defence. It was the turning-point in the history of New England.

The Indians sent a spy, ostensibly to sell furs. He returned with the news that though the captain was courteous "he saw by his eyes that he was angry in his heart." Four of the Indians came swaggering into the village. "Tell your captain that we know he has come to kill us. But we do not fear him. Let him begin as soon as he dares. We are ready for him."

Other Indians came pouring in, and, followed by the yelling crowd, the gigantic Pecksuot made his way into the hut where were Standish and four men. The chief began to whet his knife, and marched up to Standish, boasting of his power to lay the "little man" low. The captain coolly ordered the door to be shut to keep any more Indians from entering, and then with a rush he seized the knife from the Redskin, and after a desperate struggle plunged it into his heart. Two other Indians were killed in the fray, and the fourth, Wituwamat's brother, was seized, bound, taken out, and hanged. The Indians outside fled into the wilderness and were pursued. They rallied after a little, but three were immediately shot down, and then the whole body made off.

"Oh, how happy a thing had it been that you had converted some before you had killed any!" wrote the Rev. Mr. Robinson from Leyden. To which the unanswerable reply was returned that those on the spot were the best judges of what to do, that Standish was responsible for the safety of the colony, that the measures he adopted were purely in self-defence, and that in no other way could he have saved the colonists from massacre. His fight with Pecksuot ensured the permanence of the settlement, and henceforth the talk of eventual return came to an end.

Alarms of attack constantly came in, and kept the captain busy. In 1622, to guard against the danger of surprise, a palisade was built round the settlement. It was nearly a mile long, and was formed by trunks of trees driven in deep down side by side, so that it was a work of some importance. In the centre a blockhouse was built to serve as a citadel. A citadel it was in more senses than one, to judge by De Rosière's description of what he saw in 1627.

"Upon the hill they have a large square house, with a flat roof made of thick-sawn planks, stayed with oak beams, upon the top of which they have six cannons, which shoot over balls of four or five pounds, and command the surrounding country. The lower part they use for their church, where they preach on Sundays and the usual holidays. They assemble by beat of drum, each with

his musket and firelock, in front of the captain's door; they have their cloaks on, and place themselves in order, three abreast, and are led by a sergeant without beat of drum. Behind comes the governor in a long robe; beside him, on the right hand, comes the preacher, with his cloak on and with a small cane in his hand; and so they march in great order, and each sets his arms down near him."

No notice of Standish would be complete without some allusion to the story of the courtship of "the maiden Priscilla" that has been sung so sweetly in Longfellow's brilliant hexameters. It is said to be merely a legend, but, legend or no legend, the fact remains that Priscilla Mullins was one of the young girls on board the Mayflower, and that John Alden afterwards married her.

Rose Standish, as we have seen, accompanied her husband to New England, and in the first winter, which proved so fatal to the pilgrims, she died, and in the same winter died the father, mother, and brother of Priscilla. The captain remained a widower for some years, and then, making up his mind to win Priscilla for his second wife, is said to have resolved to do it by proxy, and sent the message by John Alden.

"Go to the damsel Priscilla, the loveliest maiden of Plymouth,
Say that a blunt old captain, a man not of words but of actions,
Offers his hand and his heart, the hand and heart of a soldier;
Not in these words, you know, but this in short is my meaning.
I am a maker of war, and not a maker of phrases;
You, who are bred as a scholar, can say it in elegant language,
Such as you read in your books of the pleadings and wooings of lovers,
Such as you think best adapted to win the heart of a maiden."

As Alden was already in love with Miss Mullins the commission was a difficult one, and he in vain tried to get out of it. The masterful captain, however, insisted, and Alden did his best for him, as we know. As far as Standish was concerned, Priscilla would have none of him, but as to his loyal, good-looking, eloquent friend she held very different opinions, and so the praises of the captain, which promised to be interminable, were at last cut short with the "Why don't you speak for yourself, John?" which sent Alden off in agony to the seashore.

Thinking it, however, his duty to inform his client how matters stood, he returned and did so. Standish was furious, and the little man—"Captain Shrimp" was his nickname amongst his enemies—was inclined to be thorough when he was angry. However, an alarm of Indians approaching cut short the interview, and the captain buckled on his harness and strode off to the blockhouse, where the rattlesnake skin filled with arrows lay on the table as a defiance, and the Red-skin who had brought it was waiting for his answer. Standish did not keep him waiting very long.

"Leave this matter to me, for to me by right it pertaineth.
War is a terrible trade; but in the cause that is righteous
Sweet is the smell of powder; and thus I answer the challenge.
Then from the rattlesnake's skin, with a sudden contemptuous gesture,
Jerking the Indian arrows, he filled it with powder and bullets,
Full to the very jaws, and handed it back to the savage,
Saying in thundering tones, 'Here, take it! This is your answer.'
Silently out of the room then glided the glistening savage,
Bearing the serpent's skin, and seeming himself like a serpent
Winding his sinuous way in the dark to the depths of the forest."

Standish with eight men and guide went off to meet the enemy, and was absent for some time. The rumour of his death brought matters to a crisis between Alden and Miss Mullins, and when Standish returned as one risen from the grave it was to meet the wedding party and to shake hands with the bridegroom and bride. In a few years' time Standish proved more successful in another courtship. His second wife was Barbara—his deceased wife's sister.

He died in 1656, when treasurer of the colony, leaving three sons. On Captain's Hill at Duxbury there now stands his lofty monument, built in 1872, towering a hundred and twenty feet from the summit of the cliff, and serving as a landmark from afar. But, in the words of its inaugurator, "High as it may gleam in the rising or setting sun upon the mariner returning in the very furrow that the keel of the Mayflower made, the principles of common sense, moral truth, manly honesty, prudent energy, fidelity incorruptible, courage undaunted, all the qualities of manhood that compel unflinching execution of the State's behest, are firmer and higher and brighter still."

THE SALT-WATER AQUARIUM.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

(Continued from page 558.)

ANOTHER thing which *must* be excluded is dust, and this may be easily done by means of an ordinary sheet of glass, which can be procured for a few pence. In order to render it as effective as possible, a strong wine-cork should be cemented to each corner in such a manner that the glass may be raised about an inch or so from the actual rim of the aquarium, the corks fulfilling the duties of legs. The great advantage of this plan is that the air-supply is not cut off, and that, of course, is a matter of the greatest importance.

If the oblong tank cannot be obtained, or is thought unsuitable, a very fair substitute may be found in the bell-shaped glasses with which gardeners are accustomed to cover their choicest flowers, thus enclosing them in a miniature greenhouse. These, which may be had very cheaply of various sizes, should be treated in exactly the same manner as the tanks, with regard to the exclusion of light and dust.

Let us now suppose that the vessels are procured, and duly filled with sea-water; what is next to be done?
